RUSSIA—SILIUS

RUSSIA. See UNION OF SOVIET SOCIALIST REPUBLICS for an outline of Russian history from earliest times and an account of the present day Soviet Union; MIDDLE EAST—*Russian Messianism and the Middle East;* RUSSIAN LANGUAGE AND CULTURAL LIFE for articles on Russian language, literature, drama, music, art, and architecture; RUSSIAN SOVIET FEDERATED SOCIALIST REPUBLIC (RSFSR) for a description of the largest of the 16 Soviet Union republics; RUSSO-TURKISH WARS for the history of conflicts between the neighbor countries since the 16th century.

RUSSIAN ARCHITECTURE. See RUSSIAN LANGUAGE AND CULTURAL LIFE—*6. Architecture.*

RUSSIAN ART. See RUSSIAN LANGUAGE AND CULTURAL LIFE—*5. Art.*

RUSSIAN CHURCH. The first conversion of the Rus to Christianity dates from the days of the great Patriarch Photius (820?–891) of Constantinople; a special bishopric seems to have been established in that period at Tmutarakan, near which the modern city of Krasnodar is located (at the Black Sea on the Kuban River Delta). At Kiev, where there was already a cathedral church of the Prophet Elias (Elijah), an organized Christian community existed as early as 945. There were a considerable number of Christians in the retinue of Grand Prince Igor, who had to take an oath in the church at the signing of a treaty with Byzantium in 945. Igor's wife, Olga, was a Christian herself. Our data about this early period are scanty and controversial. Apparently there were links with both Byzantium and the West, and a western bishop was about to go to Kiev. Of decisive importance was the conversion of Grand Prince Vladimir, the ruling duke of Kiev, probably in 989. He made Christianity the official religion in the Russian lands.

Early Organization.—The expansion of the new religion was rather fast, but not without resistance, and probably in many cases conversion was quite superficial. In any case, in the 11th century the church was firmly established in Russia and a regular organization was inaugurated. The church was organized under the jurisdiction of Constantinople, as a special province of the Ecumenical Patriarchate, under the headship of a metropolitan, with residence at Kiev, who at an early date assumed the title "of the whole Russia." Several dioceses (including that of Novgorod in the north) were established under his primacy. Metropolitans were to be appointed and consecrated by the patriarch of Constantinople and most of them were Greeks. In the inner administration, however, the Russian Church enjoyed full independence. The Slavonic language was used in worship and in preaching. Links with the southern Slavs were strong at that time, and it was from Bulgaria that many Byzantine religious and other writings were circulated in Russia. Some new translations from Greek were made in Kiev and elsewhere. The church had a national character from the very start, but the basis was Byzantine, if in a Slavic dress. The great cathedrals in Kiev and Novgorod were already erected in the 11th century and dedicated to Hagia Sophia, like the famous church at Constantinople. The great underground monastery at Kiev, the Caves Lavra, dates from about the same time. How deeply Christianity penetrated the masses at that period it is difficult to say. But on the top level, Christian culture was already flowering, as we can judge by the numerous literary documents of that time, including the remarkable Russian *Chronicle.*

Later Organization.—The Mongolian (Tatar) invasion and conquest in the 13th century accelerated the shift of political and national centers to the north, where Moscow soon became a new focus of national unification. The see of the metropolitan was translated to Moscow in 1328, although for a certain time the title was still "of Kiev and the whole Russia." Certain Russian lands in the south and the west were incorporated in the newly formed Lithuanian dukedom, which ultimately was merged with the kingdom of Poland. For centuries there was a strong political tension between these two powers, Moscow and Poland-Lithuania, which affected the ecclesiastical situation. Finally the church was divided, and an independent metropole was established at Kiev. After the Council of Florence (1439) had agreed on a plan for union between the Byzantine Church and Rome, a formal reason was found at Moscow to sever the link with Constantinople and to proclaim the autonomy of the Russian Church. A new metropolitan, Jonas, was consecrated by the Russian bishops in 1448. This is the date of the factual independence of the Russian Church. It was not, however, formally recognized by any church in the East until the end of the 16th century.

The union with Rome was very short-lived in Byzantium, but a new change radically affected the whole situation. When Constantinople (now Istanbul) was captured by the Turks, in 1453, the Byzantine Empire collapsed. On the other hand, the political importance of Moscow was steadily growing, and the grand duke, or czar, of Russia was

assuming the role of a protector of all subjugated Christians in the Turkish Empire. In 1589 the Church of Russia was officially recognized as an independent patriarchate. Quite different was the situation in the west and the south. Toward the end of the 16th century Poland became one of the strongholds of Roman Catholicism. For various reasons bishops of the Orthodox Church in this realm decided to join Rome, under the condition that the Eastern rite and the existing church organization were to be retained. This move of the bishops was strongly opposed by the majority of clergy and laity, but union was enforced by the secular law (the Union of Brest, 1596) and the Orthodox Church ceased legally to exist in the realm. It continued, nevertheless, and in 1620 new bishops were consecrated, although they were not recognized by the government. The final settlement occurred only in 1632 with the election of the new metropolitan of Kiev, Peter Mogila. The Orthodox Church had to live in those parts in constant tension and conflict with the Uniate Church (the church of Eastern rite, but of Roman obedience), which was strongly supported by the Polish government.

With the annexation of Kiev and other provinces in the south, in the middle of the 17th century, the church of Kiev was incorporated into the Moscow Patriarchate, if not without resistance. The final unification of the church in Russia was achieved only in the 18th century, but the difference between the north and the south, caused by the difference in the historic past, has never been fully overcome. In the late 17th and 18th centuries, the influence of Kiev was overwhelming, despite the political domination of the north.

The main (and tragic) event of church life in Moscow in the 17th century was the great schism, the schism of the so-called Old Believers, who seceded from the main church in protest against the ecclesiastical reforms of the Patriarch Nikon (1605–1681), who wanted to adjust the forms and habits of the Russian Church to the contemporary Greek use. Millions seceded from the official church, were strongly persecuted by the state, and moved to the more remote areas of the realm and even abroad. The new movement was soon split into a number of competing branches, violently opposing each other on various issues. The schism has survived until the present (1955), reduced in size and without its original zeal and impetus. The fear of western influence contributed to the obstinacy of the opposition. And, in fact, by the end of the 17th century, the cultural life of Moscow was strongly colored by the increasing influence of the West, coming chiefly through Poland. It was a preparation for that thorough westernization of Russia which was undertaken by Peter I the Great (r. 1682–1725).

Missions.—The church in Russia has been from the very beginning a missionary body. In the early centuries Russians were concentrated chiefly in the western part of European Russia. Later they began steadily moving eastward and by the late 16th century penetrated into Siberia. The church followed the course of this colonization and in many instances even led the migration (especially in the north). The most impressive example of this early mission was the preaching of St. Stephen of Perm to the Zyrenians (a Finnish tribe) in the 14th century. Not only the native language was used for worship and instruction, but St. Stephen invented a new alphabet. He wanted to stimulate a native literary development, but did not have much success. In the course of the 17th century new bishoprics were created in Siberia and an Orthodox community was established even in Peking, China.

Culture.—Links with the West were never fully missing. Novgorod was for a long period an active member of the Hanseatic League, and western influence was felt there even in the field of religious art and literature. The most striking case of this influence dates from the late 15th century. Archbishop Gennadius of Novgorod decided to produce a complete code of the Bible in Slavonic. Ancient texts were used. But strangely enough, a Dominican monk, Benjamin, probably a Dalmatian, was invited to supervise the edition, and on the whole the final text seems to have been checked not by the Greek original, but by the Latin Vulgate. This Gennadius Bible (1499) was used for the first printed edition of the Slavonic Bible (Ostrog 1581), and at this point once more edited and revised, on the basis of the Greek tradition. Western influence was quite obvious also in Moscow: several of the Kremlin cathedrals were built by the Italian masters.

On the whole, however, the Muscovite culture retained the initial Byzantine inspiration. The cultural effort was concentrated in the field of religious art, and the great art of icon painting reached its climax in the 14th century. The unique perfection of the Russian icon is now commonly recognized. It is usual to put the greatest of Russian masters of that time, Andrei Rublev (c.1370–1430), in line with the Italians, Giovanni da Fiesole (Fra Angelico, 1387–1455) and Paolo Uccello (1397–1475), and the Flemish brothers, Hubert (1366?–1426) and Jan (1370?–?1440) van Eyck. And even in this company Rublev is impressive for the balanced perfection of his art and its absorbing religious depth. This rise of the art reflected a deep spiritual movement in the church, a new monastic revival, started by St. Sergius (1314?–?1392) of Radonezh, founder of the famous Trinity Lavra, near Moscow (now the city of Zagorsk). It is true that this creative level was not retained and one may witness a certain decline of icon painting, especially in the 17th century, but even at that time such great masters can be mentioned as Simon Ushakov (1626–1686) and Procopius Chyrin. What was important was that Russian icon painting was not just an art, but a sort of philosophy in colors. It was an artistic confession of the searching soul. By no means was there a stagnation in the field of culture, if the search found its expression only in the guise of art.

In the field of education, Moscow was in the rear. The first ecclesiastical school was organized in Kiev by Peter Mogila; in 1635 it was given the status of a college. Later this school became the Theological Academy of Kiev, surviving until the Russian Revolution. In the beginning it was a Latin school, the teaching being done in that language. From early in the 16th century until 1686, Kiev was in Poland, where the official language of education was Latin. But both the curriculum and the textbooks were simply borrowed from the Jesuit schools. The famous *Orthodox Confession* of Peter Mogila was made on a Roman pattern, and Roman Catholic influence was strongly felt in his liturgical enterprises. The process was similar to that in the Greek Church of that time. This new Kiev style was partially transferred to the north, to Moscow, where it provoked and promoted confusion and split.

Church and State.—The Byzantine conception of the relation between church and state, as formulated early in the 6th century by Justinian I

the Great and, later in the 9th century, in the *Epanagoge*, was known in Russia from an early date. The theory professed a double authority (and accordingly a double allegiance): *sacerdotium* and *imperium*, or church and state. The assumption was that the two should abide and operate in perfect concord and agreement, respecting and recognizing each other's rights. The technical term for this settlement was *symphonia*. In practice, of course, the theory was never fully realized. It could not protect the church from the occasional or deliberate tyranny of the state, and yet it strongly emphasized an independent nature or character of the church. In Russia this theory had no direct application until the consolidation of the national state. Local princes could not compete with the metropolitan of the whole Russia, backed in addition by the full authority of the ecumenical patriarch. The church was one in Russia, while the principalities were many. The tension grew steadily with the strengthening of the unified state. The Moscow state of the 16th century was often intruding upon the church prerogatives, but the principle of duality and symphony was still faithfully kept.

The 17th Century.—In the 17th century an unusual coincidence increased the factual authority of the church. Under Czar Michael (r. 1613–1645), the first of the Romanov dynasty, the patriarchal throne was occupied by his father, Philaret, from 1619 to 1633. In addition, the czar was a weak man, but the patriarch was a great statesman and of strong character. The crisis came in the middle of the century, under Czar Alexis I (r. 1645–1676) and Patriarch Nikon. It may be true that Nikon used to overstep his rights, but he was acting still within the traditional Byzantine scheme. Nikon's deposition and condemnation in 1666, on the contrary, amounted to a departure from this scheme on the part of the state, not without some influence of the new western conception of the supremacy of the state. Yet, in theory the old Byzantine conception was maintained.

The radical change was effected by Peter the Great. In some sense, the ground for his so-called ecclesiastical reform had been prepared by the previous development of relations between the state and church in Russia. But Peter formally espoused a new theory. He was strongly influenced by the Lutheran conception of an inclusive sovereignty of the local prince (the *Landesherr*) in all fields of national life, both temporal and spiritual. He claimed that the prince was the source of ecclesiastical jurisdiction, so that all authority in the church derived solely from him. By this theory the church had no independent status or standing at all, but was considered just an organ of the local or national state. It was a complete reversal of the Byzantine scheme. Peter finally abolished the office of patriarch, in order not to have any chief bishop, and substituted instead an ecclesiastical college, or board, which had to be regarded as a state institution, deriving its power and authority from the monarch. This college was composed of a number of bishops, clergymen, and even laymen, appointed by the czar and acting on his behalf. A special officer, the high procurator, had to supervise the activities of the college, but he was not a member; he had the right of veto, but he had no vote. This reform met with strong resistance in the church and had to be enforced by pressure and violence. The new body was at once renamed the Holy Synod, but the title could not conceal the nature of the change. Peter could not rely upon the cooperation of the northern bishops and had to select his own people for all offices in the church, chiefly from those who were educated in the south (Kiev and elsewhere) and abroad. His chief adviser and assistant was Feofan Prokopovich (1681–1736), a learned but unscrupulous man, an ex-Uniate and fully dependent upon Protestant sources, both in his theology and in his conception of the state and church relation. The new ideology was formulated in the *Ecclesiastical Reglement* (1721), a document of joint authorship by Prokopovich and Peter himself. It was not only a constitutional act, but also an ideological pamphlet first of all. Signatures of bishops and prelates to the document were extracted by an obvious pressure. Nor could so-called recognition of the reform by the eastern patriarchs, who were led by political considerations, alter the antitraditional character of the venture.

The 18th Century.—The new settlement was imposed by the power of the state, but it was never formally received by the church. The tension was so sharp in the early years of the new regime that it was necessary to make a rule that only persons from Ukraine should be promoted bishops and prelates. This rule was canceled only in the reign of Catherine II the Great (r. 1762–1796). By a careful selection of bishops the crown was able to control the administration of the church, but it could not change its inner structure. The church was in effect in captivity, but inner freedom was never lost. An open attempt to change doctrines and rites made under Peter III (r. 1762) led to the deposition of this monarch. Of course, it was not the main cause of his deposition, but this motive was strongly stressed in the acts of accession to the throne of his wife, Catherine II, and it was precisely this motive that gave to a palace plot the significance of a national event. Catherine II continued the ecclesiastical policy of Peter the Great and it was in her reign that all church estates were secularized and the church was deprived of its financial basis and independence (1764).

The 19th Century.—The new system was finally consolidated only in the 19th century, under Alexander I (r. 1801–1825) and especially Nicholas I (r. 1825–1855). The high procurator, who was originally a kind of state representative or commissar at the Holy Synod, had gradually become an independent head of a large administrative machine, parallel to the synodal administration and embracing various fields of ecclesiastical life. His representatives in the dioceses, without having any definite status in the church itself, in fact could control the whole administration. Bishops exercised their administrative authority through a diocesan consistory, composed of members of the clergy appointed by the Holy Synod, but secretary to this body was an appointee of the high procurator, who played on the local level the same role which the high procurator played in the center. However, no system is ever fully realized in practice, and one should not overlook the passive resistance which was quite strong even in the worst periods of captivity. An open protest was voiced in Alexander II's reign (1855–1881) and radical changes in the relationship between the church and the empire were openly discussed. No major step toward a re-establishment of a more normal situation (from the church's point of view) was taken and in the days of Konstantin Petrovich Pobedonostzev, the high procurator from 1880 until 1905, pressure and control of the state was even increased.

The 20th Century.—It is highly symptomatic

that in 1904 an overwhelming majority of bishops (all of them appointees of the crown) formally insisted on abnormality of the regime. It was decided to convene a council of the church and an impressive plan of reorganization was prepared and discussed. Again no action was taken. The system inaugurated by Peter the Great upon a western pattern collapsed in 1917. The council met in August of that year, the church administration was changed, and the office of patriarch was restored. The patriarch elected was Archbishop Tikhon (Vasili Ivanovich Belyavin, 1865?–1925), previously for several years the ruling archbishop of the Orthodox Church in North America. The council had to work in a strained atmosphere of national catastrophe, revolution, and civil war, which could not fail to color the proceedings. But despite this unfavorable situation, it succeeded in passing an unusual amount of constitutional legislation which established the life of the church on the ground of strict ecclesiastical law. Unfortunately, most of these regulations could never be put in action under the Soviet regime.

Under the Soviets.—The Russian Revolution in 1917 and especially the establishment of the Soviet rule changed completely the position of the church in Russia. It not only was separated from the state (already under a provisional government in 1917), but also was persecuted. The reasons for persecution were manifold. The purpose was obvious: the church had to be deprived of all means of influencing the national life, which was to be rebuilt on an antireligious pattern. For that reason the church was prohibited any educational activity, and of course missionary expansion in any sense was impossible. Destruction of churches, heavy taxation, deportation and execution of clergy and active laymen—all these measures were but details in the general scheme of a complete transformation of the whole community into an irreligious body. The administration of the church was disrupted and for a time no central administration existed. The attempt to construct another organization to compete with the historical church, made by a group of clergy and sponsored by the government, failed to attract any considerable number of believers. Several groups were organized under such names as The Living Church, or The Renovated Church, in the early 1920's. They did not survive for long and ceased to exist long before World War II. In the meantime, order was restored and one of the old bishops, Sergius of Gorki (formerly Nizhni Novgorod) was permitted to assume the functions of an acting head. But his actions were controlled by the government. During World War II the church participated in national defense and for that reason had to be reckoned with. Metropolitan Sergei (1867–1944) was proclaimed patriarch in 1943, but died soon afterward. Metropolitan Alexei (b. 1877) of Leningrad and Novgorod was elected his successor by the council of bishops in 1944. Diocesan administration was to a large extent restored and some of the previously confiscated churches and monasteries were put again at the disposal of the church. Several training colleges for the ministry were established. But, by strict law, "religious propaganda," understood in a wide sense, is still illegal. Moreover, the church authorities are strongly controlled by a new government council on ecclesiastical affairs. And, in fact, the church must comply with the general policy of the state, which is inspired, as before, by antireligious principles. Available information on the actual situation of the church in Russia is incomplete and biased, the topic is very controversial, and no impartial interpretation can be offered. The main problem is: to what extent can a Christian church cooperate with an avowedly antireligious state, without being involved in an inextricable compromise?

Inner Life.—The inner life of the church was affected by the new policy of Peter the Great rather indirectly—through the school. In the course of the 18th century a net of seminaries was created in the country. A seminary was a kind of general high school, but it was administered by the church. There was special emphasis on religious subjects with the purpose of training the sons of the clergy, although not exclusively for the ministry. Up to the early 19th century these schools constituted the only school system in the empire. All these schools were built on the Kiev pattern—as Latin schools. There was no division of educational levels: the same schools included both elementary and graduate classes. This type of school was changed only in the early years of the 19th century when three groups of schools were established: elementary, in small towns; seminaries, in diocesan centers; and theological academies, which were real graduate schools of theology. There were four of the last: at St. Petersburg (now Leningrad), Moscow, Kiev, and Kazan. Russian language had been occasionally used in the 18th century, but not much before the 1840's was it officially approved for the teaching of theology and philosophy. The school had a western character—it was just a local version of a general type of ecclesiastical school in Europe of the 17th and 18th centuries.

Such an educational policy estranged the clergy from the people, both from the simple folks who had nothing to do with this imported scholarship and from the higher strata of the nation which followed another line of development. Nevertheless, the contribution of these schools—including practically all the humanities in their curriculums—to the general culture of Russia cannot be exaggerated. Russian scholarship and learning had its roots in the traditions and experience of the ecclesiastical school, as was true of western learning in the late Middle Ages. Still, there was a tragic rift. The school knew little of the piety of the people. The emphatic tension between learning and piety in the Russian Church could not but distort and impoverish both of them. One may describe Russian theology of the 17th and 18th centuries as a kind of "pseudomorphosis" (to borrow the term from Oswald Spengler). Theology was using an alien means of expression, which had been created and used for decidedly different purposes. It was impossible to express adequately the eastern tradition in terms either of Reformation theology or of that of the Counter Reformation. But it was precisely what had been persistently done, not only in Russia, but also in the Greek Church, until the mid-19th century, if not even later.

The whole situation was considerably changed in the course of the 19th century. The reasons for and factors in the change were manifold. First, there was a revival of contemplative monasticism, starting near the end of the 18th century, on the basis of the strict Byzantine tradition, and examples of its influence in wider fields than only the religious can be traced even in Russian

literature, as in the writings of Fyodor Dostoyevsky and Nikolai Gogol. Much later a rediscovery of the old religious art—of Byzantine and Russian iconography—contributed to the recovery of the ancient tradition. The second influence was the Biblical revival early in the 19th century, which led to a new translation of the Bible in vernacular, ultimately published with the approval of the Holy Synod. At the same time systematic translation of the writings of the fathers of the church was undertaken; the work was conducted by the four theological academies and contributed much to the enlargement of theological perspective. Next was the revival in the wider circles of the Russian intelligentsia, which began in the 1840's among the Slavophiles (of which Aleksei Khomyakov should be especially mentioned) and which reached its climax in the early decades of the 20th century. It was an awakening of a creative approach to religion, and in spite of various aberrations and excesses it revitalized the church. This religious awakening was strongly felt also in various branches of culture: in literature, art, and philosophy. The names of Vladimir Solovyoev, Konstantin Leontyev, Sergei Bulgakov, Pavel Florensky, Nicholas Berdyaev, or even Vasili V. Rozanov, and Dmitri S. Merezhkovski should be mentioned in this movement. They were not exponents of a genuine eastern tradition, and their thought was variously affected by many extraneous influences. But they did much to bring the religious theme to the attention of a wide group of Russian intellectuals. It is now widely recognized in the West itself that Russian religious thought has a valuable and creative contribution to make to the contemporary search for truth. Still, there are more problems and hints than solutions.

Bibliography.—There is no comprehensive book on the history of the Russian Church in English, except the antiquated and popular work of Andrei N. Muraviev, *History of the Church in Russia,* tr. by R. W. Blackmore (Oxford 1842). There is a popular and rather sketchy survey by Walter H. Frere, *Some Links in the Chain of Russian Church History* (London 1918); also a good but biased survey by Pavel N. Milyukov, *Religion and the Church,* part 1 of *Outlines of Russian Culture,* ed. by Michael Karpovich and tr. by Valentine Ughet and Eleanor Davis (Philadelphia 1942). Also consult Klyuchevski, Vasilii O., *History of Russia,* in 5 vols., especially vol. 3, tr. by C. J. Hogarth (London 1911–31).

RUSSIAN LANGUAGE AND CULTURAL LIFE. These subjects are here treated under the following headings:

1. Language
2. Literature
3. Drama
4. Music
5. Art
6. Architecture

Russian contributions to the arts—especially literature and music—are historically important, though of minor contemporary value.

1. RUSSIAN LANGUAGE. History.—The Russian language is the most important branch of the Slavonic family of languages in the Indo-European group. It is spoken by the most numerous of the Slavic races (the Great Russians), and is an excellent key for understanding the other Slavonic tongues, such as Bulgarian, Serbo-Croatian, and Slovenian. Polish and Czech are also in the Slavonic family, though both have been influenced more by Latin than any other Slavonic language, hence have deviated further from the original Pra-Slavonic. Russian itself should be carefully distinguished from Little Russian or Ukrainian, and from White Russian. Properly understood, Russian, the language of the Great Russians, is simply one of the eastern group of the Slavonic languages, which includes also Ukrainian and White Russian.

The morphological and syntactic development of Russian is made somewhat difficult to trace historically by the fact that Old Bulgarian, spoken by tribes along the Volga, became the ecclesiastical and literary language and remained so until the 17th century. Very early, however, the local spoken Russian of Kiev influenced Church Slavonic (Old Bulgarian) in both pronunciation and vocabulary, and in turn Church Slavonic affected the vernacular. Church Slavonic elements may still be observed in the Russian language, especially in phonetic and morphological peculiarities in words connected with intellectual and religious life. Church Slavonic, in a considerably modified form, of course, has remained the language of the Russian Orthodox Church: the Scriptures were written in it, and it was the language of church services up to the latest times. Thus, the history of Church Slavonic resembles the history of Latin in the Roman Catholic Church.

The earliest written literature, chronicles and judicial documents, employed a language that was an admixture of the vernacular and Church Slavonic. In the 14th century Moscow displaced Kiev as a cultural center, and the local speech of Moscow, a combination of southern and northern dialects, influenced the written language. But Church Slavonic still continued to influence the written language, though on a diminishing scale, until the 18th century. At that time, the great scientist, philologist, and poet, Mikhail V. Lomonosov (q.v.), pointed out in his *Russian Grammar* the dependence of the literary language on Church Slavonic, a fact that had not been scientifically studied before. The literary language now began to fall more in line with the spoken language. Toward the end of the 18th and the beginning of the 19th century, especially through the efforts of Nikolai M. Karamzin and Alexander Pushkin (qq.v.), a literary norm was established.

Characteristics.—Russian is an extremely rich language, and by virtue of its structure capable of expressing the subtlest nuances of thought. Only a great people, said Ivan S. Turgenief (q.v.), could possess such a language. As a member of the Indo-European family, Russian has developed in much the same way as other members of this family. As an inflected language, it resembles Latin and Greek in morphology. The alphabet can be mastered in one lesson. Both Russian and Church Slavonic use the same alphabet, except that Peter the Great simplified the letters of Russian in 1708 by bringing them into closer conformity with the easier Latin letters of the West. Thus there is a current form known as the "civil alphabet" and the Church Slavonic alphabet, which is called *Kirilitsa.* The civil alphabet was simplified still further after the 1917 revolution. There had been 36 letters, not counting the *ë,* which is not a separate letter and rarely occurs in this form except in grammars and texts intended for foreigners. In 1918, the Soviet government issued a "Decree on the Introduction of the New Orthography," which rejected as redundant four letters of the old alphabet. Hence the present alphabet

has 32 letters. The decree effected further simplification: the hard sign was abolished at the end of words; a clarifying differentiation was introduced for spelling certain prefixes before unvoiced consonants; useless variations in the genitive endings of adjectives, pronouns, and participles were abolished; uniformity was given to the two nominative and accusative plural endings of all three genders; the masculine and neuter form of the third person plural pronouns was substituted for the old feminine form; the masculine and neuter form of the word "one" replaced the old feminine form; the genitive singular of the feminine personal pronoun became the same as the accusative. All these changes unquestionably made for simplification, and at the time this article was written Russian had become one of the most nearly phonetic languages in Europe.

The pronunciation of Russian is not difficult. The chief obstacles for a person speaking a western European language is his tendency to make soft combinations hard. Before *e* and *i*, and before vowels beginning with *y*, such as *ya*, *ye*, and *yo*, all consonants, especially the dentals, are palatalized; that is, they are sounded not with the top of tongue pressing against the back of the teeth, but by touching the palate with the tongue higher up. Another difficulty is the hard *l* before *a*, *o*, and *u*. This is not pronounced as in English with the tip of the tongue at the root of the teeth, but rather with the tip of the tongue just touching the teeth; the uvula then vibrates, producing a kind of guttural *l* similar to a guttural *r*. Other sounds offer no particular difficulties. However, a real obstacle for non-Russians learning the language is the variation in stress in Russian words. No definite rule for placing the stress is possible as in other Slavonic languages such as Polish and Czech. The stress is not always placed in the same position in the inflected forms of a single word. A few helpful generalizations regarding stress may be stated: (1) the stress in long (attributive) forms of an adjective is that of the nominative singular; (2) pronouns are usually stressed on the case endings; (3) the majority of nouns are stressed throughout as in the nominative singular. Incorrect stress may sometimes lead to misunderstanding, especially in pairs of words which are spelled alike but stressed differently. Accurate handling of stress in Russian words can come only after long experience with the language.

Russian has comparatively few sounds which do not occur in English, and the variations in sound represented by each letter are usually regular. One peculiarity of the sound system is that there are two sets of vowels: hard vowels and soft or "jotated" vowels. Pronunciation of a hard vowel varies according to whether it is stressed or unstressed and, if unstressed, according to its position in regard to the stressed vowel in the word. A soft vowel, whether it appears initially, or follows another vowel, has the same range of sounds as the corresponding hard vowel but is preceded in each case by the sound "jot." There is a system of vowel mutation governed by definite rules, and also a regular system of consonant mutation, which likewise has its own rules.

The Russian noun has three genders, two numbers, and six cases (a seventh, the vocative, exists only in a few survivals). The genders are declined differently, but their plurals are virtually identical except for the genitive case. The neuter singular differs little from the masculine, but the feminine declensional forms are entirely different. A peculiarity in inflection is that words with soft endings are declined soft throughout. And there are many variations in the genitive and prepositional cases, owing chiefly to a confusion of the historic *o* and *u* declensions. During historic times Russian lost many of its grammatical forms, which can still be studied in Church Slavonic. One of these is the dual, which still exists in a sense after the numerals "two," "three," and "four," when the noun stands in the genitive singular, because that form frequently corresponded to the nominative dual.

In Russian the attributive is transformed into the corresponding adjective or participle. Hence Russian is richer in adjectival forms than the languages of the West. Numerals are fully declined and are quite difficult. Although the nominal declension is complex, its syntactical application is rather simple, since an abundance of cases, each with a distinct function, obviates certain difficulties which are present in a language without grammatical endings.

The verb system is an interesting combination of simplification and complexity. Little has survived of the intricate structure of the verb system in Church Slavonic, with its aorist and multiplicity of past tenses. Only one unconjugated past is left. The ordinary future is a compound of *I shall* and the infinitive, but in a large class of verbs, the present does duty for the future. There are two conjugations, a wealth of participial forms, and gerunds from the old masculine nominative singular. As though to compensate for this relative simplicity in the conjugational system in a highly inflected language, a curious mechanism exists by which these few verbal forms are able to express by means of aspects most of the shades of meaning expressed in English through the tense structure. That is, the five tenses of the Russian verb are divided into two groups called the imperfective and perfective aspects. The imperfective aspect has three tenses: past, present, and future. The perfective aspect has only a past and a future. Each verb has two infinitives, from one of which the imperfective aspect is derived, from the other the perfective. The two infinitives are closely related. One may be formed from the other by (1) the addition of a prefix, (2) by the expansion of one infinitive through insertion of a syllable, or (3) by the alteration of a vowel preceding the infinitive ending. For a few verbs the two infinitives come from different stems. The imperfective tenses indicate iterative and durative actions; the perfective tenses indicate instantaneous actions, or single and complete actions. The perfective aspect sometimes indicates also the performance of the action for a short time, or the beginning of the action, which is itself an instantaneous action. With such an instrument for nice distinction in meaning, it may be readily seen that Russian is capable of distinguishing shades of thought beyond the capacities of most languages. Needless to say, long training is necessary in order to make full use of the fine distinctions in the use of the aspects of the verbs.

Russian does not ordinarily use the passive voice, and it has a very simple way of ex-

pressing the subjunctive with an unconjugated past tense and the addition of a particle. A reflexive is also used, which does not differ from the rest of the verbs, except for the addition of the unchanged reflexive ending.

Borrowings.—The influence of Church Slavonic (Old Bulgarian) on spoken and written Russian has already been pointed out. Other foreign influences may be noted. Tatar has contributed names for many Oriental objects, such as weapons, garments, jewels, and some terms concerned with government. A few words have come from Finnish, and from the more refined literary Polish came a good many words dealing with manners. Many Dutch and German words were imported after Peter the Great "opened his window on Europe." By the 18th century, with the full cultural rapprochement with the West, numerous words had been introduced; most of them were French, but some were English and German. Since then, new loan words from international scientific terminology have entered the Russian language. Since 1917, the Soviets have evinced a partiality for American words, not a few of them slang.

Despite its rather formidable grammar and unfamiliar alphabet, the Russian language is simple and direct and admirably suited to every purpose that a modern language serves. Its literature, both prose and poetry, is among the great literatures of the world. It is spoken by more than a hundred million people, and as the principal language of the Soviet Union, its importance in international intercourse will certainly increase.

Bibliography.—DICTIONARIES: Sreznevski, I. I., *Materials for a Dictionary of Old Russian Language,* 3 vols. (St. Petersburg 1890–1912); *Dictionary of the Russian Language,* 4 vols. to the letter L (St. Petersburg 1895); Dal, V. I., *Explanatory Dictionary of the Living Great Russian Language,* 4 vols. (St. Petersburg 1904–1909); Preobrazhenski, A. G., *Etymological Dictionary of the Russian Language,* to the letter S (Moscow 1910–1916); Pavlovski, I. Ya., *Russische-Deutscher Wörterbuch* (Riga 1911); Alexandrov, A. A., *Russian-English and English-Russian,* 2 vols. (New York 1929); Ushakov, D. N., *Explanatory Dictionary of the Russian Language,* 4 vols. (Moscow 1934–1940); Segal, L., *New Complete Russian-English Dictionary* (New York 1942).

Executive Officer, Department of Slavic Languages, Columbia University.

2. LITERATURE. Literary Beginnings.—Medieval literature appeared somewhat late in Russia; the first documents date from the 11th century, about 50 years after the introduction of Christianity. They were in Church Slavonic, which St. Cyril and St. Methodius created as a written language in the 9th century. Church Slavonic resembles Old Bulgarian. Slavonic remained the language of the Russian Orthodox Church and was used for all literary purposes until the 17th century, when it was displaced by the vernacular. Printing also was long delayed; the first book was published in 1564, and printing did not come into general use until the 18th century.

The earliest literary remains are connected with the flourishing cultural development of Kiev, which lasted until about 1200. Religious writings, mostly sermons, were inspired by Byzantine Greek models. But some highly original examples of pulpit oratory have come down to us, such as the excellent *Eulogy on St. Vladimir* by Ilarion, metropolitan of Kiev (d. 1053), and the ornate and eloquent sermons of Cyril, bishop of Turov (12th century). The account of a pilgrimage to the Holy Land by Abbot Daniel the Palmer (12th century) is highly informative, and its whimsically realistic revelations of ecclesiastical trickery recall Chaucer's charming narratives.

Most remnants of early secular literature are chronicles (*letopisi*). These exist only in later compilations, although contemporary entries go back to about 1040. The chronicles contain valuable material for reconstructing the ancient history of Russia, and some have considerable literary merit. One of the best is the *Chronicle* imputed to Nestor (q.v.), 12th century monk and author, which includes some delightful tales of mingled history and popular lore. Another notable secular piece is the *Instructions to His Children* of Vladimir Monomakh, grand prince of Kiev (1113–1125), a document of wise and pious counsel. A considerable body of purely imaginative literature was probably written during the Kiev period, but the only substantial piece to survive is *The Word of the Campaign of Igor* (12th century), discovered in 1795 and first published in 1800. This prose poem tells of the disastrous expedition of Prince Igor against the nomadic Polovtsy of the south. The work occupies a unique place in ancient Russian literature, and its unknown author was clearly a writer of great talent. The rich imagery, diction, and beautiful lyric interludes compare favorably with the best western European medieval verse. Later fragmentary remains in similar vein have been preserved, some of them describing the Battle of Kulikovo (1380), but they are pale imitations of *The Word of the Campaign of Igor.*

After the downfall of Kiev, there was a period of strife between the several city states, and not until the rise of Moscow were conditions again favorable for literary creation. The results, even then, were poor, since the new literature was ecclesiastical—Byzantine in spirit and monotonously formalized in style. Many ser-

mons and lives of saints were written, and churchmen kept up the official chronicles. There were a few interesting exceptions. The *Domostroi* is generally ascribed to Sylvester, adviser to Ivan IV, the Terrible (1530–1584, q.v.), although it was probably written earlier. Essentially a description of household management, this work reveals in stark detail the family pattern of the age: the father is a swaggering lord of creation, to whom mother, children, and servants owe absolute obedience. The most famous among polemical and historical writings is an exchange of letters between Ivan the Terrible and his former general, Prince Andrei Kurbski (1528–1583). These show the czar's talents as a controversialist and master of biting invective. The most significant Muscovite literary performance came from the pen of the Archpriest Avvakum (1620–1681), the leader of the Old Believers in the church schism of the time. In several epistles Avvakum encouraged his followers to oppose religious and cultural innovations, but his chief work is his *Life* (1673), written in the vernacular and revealing a courageous personality and a masterful and original style.

Folk Literature.—Russia has one of the richest folk literatures of Europe, kept alive through centuries by oral transmission. No doubt its remarkable vitality rested partly on the fact that until 1917 illiteracy was the rule rather than the exception among the masses of the population. One very important genre of Russian folk literature is the *byliny*—long narrative poems in unstanzaed, stressed verses. The themes are either historical events, usually related to the siege of Kazan (1552), or the legendary feats of heroes, such as Ilya of Murom. The *byliny* were intoned by professional folk reciters. The oldest extant texts were recorded from oral recitations by Richard James, an Englishman, in 1620. A second collection, attributed to Kirsha Danilov, was taken down in the middle of the 18th century in Siberia and first published in 1804. Later scholars have made collections. M. A. Rybnikov collected many (1861–1867), mostly from the fishermen of northern Russia, where there is a long tradition of *byliny* recitations. *Spiritual Verses* (*Dukhovnye stikhi*), somewhat related to the *byliny* in style, were recited by wandering religious mendicants; they were much influenced in subject matter by Byzantine apocryphal literature. There are also many and splendid folk songs about wedding ceremonials, harvest, death, feast days, superstitions, etc. Perhaps the richest branch of Russian folklore, however, is its folktales (*narodny skazki*). The tales resemble western European fairy tales, except that in Russian prose folktales the fairy does not appear. As narratives they are highly original, artistic, and charming, with all manner of supernatural figures and events. There are many published collections, but among the earliest and the best are those by Alexander N. Afanasyiev, or Afanasev, q.v. (1870) and Nikolai Y. Onchukov (1903). Other departments of folk literature are the charms (*chastushka*)—each is usually a song of four rhymed lines—and popular dramas based on 17th and 18th century literary sources. Folk literature greatly influenced the work of several great Russian poets, Alexander Pushkin particularly, and its themes and imagery have been woven into Russian ballet and opera. Soviet scholars have manifested a renewed interest in the country's rich folklore, and many collections and learned investigations of this material have been made.

Eighteenth-Century Literature.—Peter the Great (1686–1725, q.v.) opened a window to western Europe, and the whole country felt new energizing influences. Peter abolished the Old Church Slavonic script and simplified the alphabet; some of the changes were suggested by Latin script. The vernacular came into use as the written language, although it continued for some time to be heavily influenced by Old Church Slavisms, and foreign loan words and expressions.

Ukrainian and White Russian scholars and clerics now began to introduce a Latinized scholasticism into Muscovite Russia. The forerunner of this development was Simeon of Polotsk (1629–1680) who made many translations from Latin and published books of rhymed didactic verse. Two prelates of Ukrainian extraction and education, however, were more original as men of letters. They were St. Demetrius Tuptalo, metropolitan of Rostov (1651–1709), and Feofan Prokopovich, archbishop of Novgorod (1681–1736), both of whom wrote plays. Prokopovich was also the greatest orator of his day; his *Spiritual Reglement* (1718) advocated the liberal reforms of Peter the Great.

Peter, whose feverish activity was directed toward practical improvement in Russia, cared little for culture as such, and imaginative literature did not flourish during his reign. A historian of the time, V. N. Tatishchev (1686–1750), forecast with some truth that it would take Russia seven generations to catch up with civilization in the West. A book typical of the literature in Peter's reign is *On Indigence and Wealth,* by Ivan Pososhkov (1652–1726), a work erroneously thought to have anticipated the economic ideas of Adam Smith (1723–1790, q.v.).

The reigns of Anna Ivanovna (1730–1740, q.v.) and Elizabeth Petrovna (1741–1761, q.v.) did little to promote literature. For the first time, French neoclassicism began to exercise a marked influence on Russian letters, as seen in the Horatian satires of Prince Antiokh Kantemir (1709–1744, q.v.) and in the dull odes of Vasili Tredyakovski (1703–1769), whose real contribution to literature was an able treatise on prosody. Mikhail Lomonosov (1711–1765, q.v.) was of infinitely greater stature. He is generally regarded as both the founder of modern Russian literature and the father of Russian science. In intellectual and artistic versatility, he was a kind of Russian Goethe. The language of his majestic odes sounds strikingly modern, and his pioneer studies in literary criticism and prosody were very important for his day.

It has been said that Peter the Great created new bodies for the Russians, but Catherine the Great (1762–1796, q.v.) put souls into them. Certainly her reign surpassed Peter's in encouraging cultural development. In a modern sense, during this period, Russian drama really began. It was initiated by Alexander Sumarokov (1717–1774), also an able literary critic and excellent songwriter. Under the neoclassic influence of Voltaire (1694–1778, q.v.) Mikhail Kheraskov (1733–1807, q.v.) won the title of Russian Homer with his vast epic poems: *Rossiada* (1779) on the taking of Kazan by Ivan the Terrible, and *Vladimir* (1785) concerning the introduction of Christianity into Russia. Both of these long narrative

poems were very popular in their day, but their only saving grace for a modern reader is a kind of sprightly dullness.

Better poets than Kheraskov wrote during Catherine's reign. The greatest was Gavriil Derzhavin (1743–1816, q.v.). His *Ode to God,* written in the favorite genre of the age, even surpassed Lomonosov's poetry, particularly in the splendor of its imagery. Of a lower order, but still highly competent poetry, were the clever fables of Ivan Khemnitser (1744–1784) and a very popular adaptation by Ippolit Bogdanovich (1742–1803, q.v.) of La Fontaine's *Psyche.*

Although the French neoclassical influence was dominant during Catherine's lifetime, English and German influences also played a part. Several satirical journals appeared. Catherine herself seems to have started the first one in 1769. It was called *All Sorts and Sundries,* and was inspired by the English journals *Tatler* and *Spectator* of Joseph Addison and Sir Richard Steele (qq.v.). The Freemason and pietist Nikolai Novikov (1744–1816, q.v.) edited a number of satirical journals, in which he boldly criticized social conditions, and in 1773 the empress suppressed all the journals. Catherine affected liberalism only up to the point where it grew critical of her regime. She also suppressed the *Journey from St. Petersburg to Moscow* (1790) and imprisoned its author, Alexander Radishchev (1749–1802, q.v.). This book attacked both serfdom and autocracy, and Soviet scholars now regard it as the starting point of revolutionary thought in Russia.

A foremost literary figure of Catherine's time was Nikolai Karamzin (1766–1826, q.v.), whose most significant service was in reforming the literary language. This reform lay in the direction of eliminating Church Slavisms and in following French syntactic and stylistic models. A group of literary conservatives unsuccessfully opposed these reforms. Their leader, Admiral Alexander Shishkov (1754–1841), argued for the preservation of archaic forms. Under Karamzin's influence and practice, modern Russian literary prose took shape, a monument of which is his well-known work, *A History of the Russian State,* 12 vols. (1818–1826). Influenced by Jean Jacques Rousseau (q.v.) and the 18th century English writers, Samuel Richardson and Laurence Sterne (qq.v.), Karamzin also introduced the sentimental movement into Russian literature. His charming *Letters of a Russian Traveler* (1791) and his tremendously popular sentimental tale, *Poor Liza* (1792) are both in this vein. The most talented followers of Karamzin were Vasili Zhukovski (1783–1852, q.v.) and Konstantin Batyushkov (1787–1855). There is little trace of sentimentality in Batyushkov, for his models were French and Latin elegiac poets and Torquato Tasso (q.v.) ; his verse is classical in form. Zhukovski, however, added to the new sensibility the influence of English and German romantic writers. His mood is primarily elegiac, and his few original lyrics are among the best in Russian. Much of his fame rests on his extraordinary talent for translation; in this art he is hardly surpassed by translators in any language. Some of his versions of English poems are better than the originals, and he made splendid translations of Indian, Persian and Greek epic poetry.

The Golden Age of Poetry.—The bulk of literature written during Catherine's reign slavishly followed French, German, and English models. There was little originality, for Russian writers were still serving an apprenticeship to the authors of western Europe. In the first forty years of the 19th century, however, Russian literature came of age in a wonderful flowering of poetry both original in form and peculiarly native in content.

The towering genius of the period was Russia's greatest poet, Alexander Pushkin (1799–1837, q.v.). Influenced at first by neoclassical 18th century French poets, he soon fell under the romantic spell of George Byron (q.v.). Finally, he struck his own original manner, which was essentially realism in a form lucid and classical. His earliest long poem was *Ruslan and Lyudmila* (1818–1820), a semi-ironic and light romance. A series of verse tales followed—*The Prisoner of the Caucasus* (1820–1821), *The Robber Brothers* (1821), *The Fountain of Bakhchisarai* (1822), and *The Gypsies* (1824)—all more or less inspired by Byron's Eastern verse tales. Meanwhile, in 1823 he began writing his masterpiece, which he did not complete until 1836. This was *Evgeni Onegin,* a novel in verse. He also wrote several plays, a wonderful series of folktales in verse, other long poems, including the inimitable *Bronze Horseman* (1833), a substantial body of prose, and the finest collection of lyrics in Russian. His early death in a tragic duel shocked the country and left unfulfilled, despite his great achievements, the career of a poet who belongs among the foremost writers of the world.

The Pushkin Pleiad was a group of poets of real distinction who were contemporary with Pushkin. The most talented of them was Evgeni Baratynski (1800–1844), a profoundly intellectual poet who aspired to a fuller union with nature. In striking contrast was the bright, clear, convivial poetry of Nikolai Yazykov (1803–1846). Others in the group were Denis Davydov (1784–1836), author of many fine poems on war and love; Prince Peter Vyazemski (1792–1878), a witty poet and acute critic; Baron Antony Delvig (1798–1831), Pushkin's close friend and the author of a few chiseled lyrics; Kondrati Ryleyev (1795–1826), executed as a leader in the revolt of the Decembrists (q.v.), who left a sheaf of noble and eloquent civic poems; Dmitri Venevitinov (1805–1827), whose few philosophical poems promised a lofty poetic future if he had lived; and Fyodor Glinka (1786–1880) whose verse combined deeply religious devotion with marked simplicity. An older poet, apart from the Pushkin Pleiad, was the greatest Russian fabulist, Ivan Krylov (1768–1844, q.v.). His first book of *Fables* appeared in 1809, and he continued to write fables for years. The enormous popularity of his verse arose from its sound common sense and his perfect mastery of words.

A very great genius of this age was Mikhail Lermontov (1814–1841, q.v.). At his best he rivals Pushkin, although he was at his best only in a few perfect lyrics, in certain parts of his verse tales, and in his unsurpassed narrative romantic poem, *The Demon* (1829–1833). He, more than Pushkin, deserves the title of the Russian Byron, though he was outgrowing that manner when he died. The Golden Age of Russian Poetry closed with Fyodor Tyutchev (1803–1873) and Aleksei Koltsov (1808–1842, q.v.). Koltsov was an uneducated and plodding admirer of

Pushkin. His attempts at philosophical poetry are mediocre, but his simple lyrics on the realities of peasant life, the first poetry of this kind in Russian, are excellent. Tyutchev is one of the three or four greatest figures of Russian poetry. His verse began to appear as early as 1836, but critical recognition came much later. His poetry is essentially metaphysical and is based on a pantheistic conception of the universe. Its prevailing pessimism derives from a constant dualism—a struggle between chaos and cosmos. His diction is faultless, and the love lyrics of his later years are cast in perfect 18th century classical style. Many years passed before Russia produced a body of verse in any way comparable to that of the first forty years of the 19th century.

Early Prose Fiction.—Little prose fiction of distinction was written in Russia during the early 19th century. Karamzin's *Poor Liza,* already mentioned, dates somewhat earlier. Vasili Narezhny (1780–1825) wrote *A Russian Gil Blas* (1814) in the realistic English and French picaresque tradition, and a little later Faddei V. Bulgarin (1789–1859) wrote *Ivan Vyzhigin* (1829) in a similar vein. Sir Walter Scott's popularity in Russia inspired historical romances of some merit. Mikhail N. Zagoskin (1789–1852) wrote *Yuri Miloslavski* (1829); Ivan I. Lazechnikov (1792–1869) wrote *The Last Recruit* (1831), *The Ice House* (1835), and *The Heretic* (1838); and Pushkin wrote *The Captain's Daughter* (1836). The Byronic prose tales of adventure of Alexander A. Bestuzhev (1797–1837, q.v.), pseud. Marlinski, won wide popularity. The fiction of Prince Vladimir Odoyevski (1804–1869) and of Aleksei Veltmann (1800–1869) was less obviously romantic. Yet a romantic Byronic hero did not keep Lermontov's prose masterpiece, *A Hero of Our Times* (1840), from being a realistic and acute psychological study of human nature.

The greatest fiction writer of this period was Nikolai V. Gogol (1809–1852), who combined the romantic and the realistic as his special quality. Much in his early collections of short stories, *Evenings on a Farm Near Dikanka* (1831) and *Mirgorod* (1835), is sheer romanticism, but in some early stories and in later tales he combines the romantic with an unusual power for realistic portraiture. After finishing his well-known play *The Inspector-General* (1836), he began work on his great masterpiece *Dead Souls.* Here with realism and sharp satirical intent he creates a series of unforgettable characters and reveals the vulgarity and ugliness of provincial life. The last years of Gogol's relatively short life were darkened by religious mania that undermined his creative powers.

The Rise of the Intelligentsia.—Partly under the philosophical influence of Friedrich W. J. von Schelling and Georg W. F. Hegel (qq.v.), a kind of intellectual revolution took place between 1825 and 1840 that resulted in the formation of a class known as the *intelligentsia,* which later played so important a part in Russian political and social thought. By 1840 this movement had divided into two sharply opposing groups—the Slavophiles and the Westerners. The Slavophiles, strongly nationalist, advocated a return to the virtues and traditions of old Russia; they sanctioned the Orthodox faith and the autocracy of the czar. Important Slavophile leaders were the brilliant religious thinker and poet, Aleksei Khomyakov (1804–1860), the brothers Konstantin Aksakov (1817–1861), and Ivan Aksakov (1823–1886, qq.v.). The leader of the Westerners was the great literary critic, Vissarion Belinsky (1810–1848, q.v.), who felt that Russia's salvation lay in assimilating the progress of Western Europe. The romantic idealism of Belinsky's early critical writing changed later to a demand for a literature of social significance and reform. His famous contemporary, Alexander Herzen (1812–1870), was also a Westerner. Herzen was obliged to leave Russia early in life, and he carried on from abroad, through journalism, a political war against the Russian government. Herzen had artistic talents, and although most of his writing was political and social his brilliant autobiography, *My Past and Thoughts* (1852–1855), and his didactic novel *Whose Fault?* (1847) have high literary merit.

Belinski established a tradition in literary criticism that was followed ably by Nikolai G. Chernyshevski (1828–1889), Nikolai A. Dobrolyubov (1836–1861, q.v.), and Dmitri Pisarev (1840–1868). Carrying still further Belinski's emphasis on social significance in literature, their principal criterion of value in art was its utilitarian value. Dobrolyubov's famous article, *What Is Oblomovism?* (1859), amounts to a criticism of Russian life at the time. The radical trend begun by the Westerners became more emphatic about 1870 with the rise of the Populists (*narodniki*); they stressed service to the people as the only possible atonement for the sins committed by the educated class against the serfs. Their principal leader was the critic Nikolai K. Mikhailovski (1842–1904). Few figures of notable literary ability were in the camp of the Slavophiles. The critic Apollon Grigoriev (1822–1864) was an exception, for his best work is deeply imaginative and keenly perceptive. Nikolai Strakhov (1826–1896) was an able though less profound critic, and the critical and philosophical writing of Konstantin N. Leontyev (1831–1891) showed excellent literary talent.

The Realistic Novel.—The classical Russian school of realism in fiction stems from Pushkin, not only from his prose tales, but also from his novel in verse, *Evgeni Onegin.* Pushkin's style, his realistic descriptions of life on provincial estates, and such character creations as Evgeni and Tatyana all left a deep imprint on later fiction. In some ways Gogol was a continuator of Pushkin, though he also had great originality, especially in style and characterization. His humorous types are delightful and the oppressed character of his famous tale, *The Cloak* (1836), illustrates a new "philanthropic trend" in Russian fiction. One of the earliest writers to reflect the influence of Gogol was Vladimir Sologub (1814–1882), in his book *Tarantas* (1844), a satirical account of a journey from Moscow to Kazan.

Soon appeared the great followers of Pushkin and Gogol, all of whom became known beyond Russia. One of the earliest was Ivan A. Goncharov (1812–1891). Belinski hailed his first novel, *A Common Story* (1847), as a vital contribution to the new realistic school, but his masterpiece, *Oblomov* (1858), became a national classic. The hero Oblomov is a clear descendant of Pushkin's Evgeni, and he became a symbol of sloth and ineffectiveness—faults which exist in Russian character despite generous aspiration and a high sense of values.

An older man, Sergei Aksakov (1791–1859, q.v.), found his proper medium in literature rather late in life, under the influence of Gogol. He published *A Family Chronicle* (1856), *Recollections* (1856), and *Years of Childhood of Bagrov Grandson* (1858). All are essentially reminiscences of his own life and that of his grandparents, though they undoubtedly contain a large fictional element. They are masterpieces of realistic narrative. The author's remarkable objectivity, his pure prose style, and the freshness and vividness with which he recreates scenes of nature have hardly been equalled in Russian fiction.

The crown and glory of the realistic novel were the three giants Ivan Turgenev (1818–1883), Fyodor Dostoyevsky (1821–1881), and Lev (Eng., Leo) Tolstoy (1828–1910, qq.v.). Modern criticism considers Turgenev the least able of the three; he is obviously a continuator of Pushkin. His first substantial work, *A Sportsman's Sketches* (1847–1852), was poetic in style and showed sympathetic understanding of the oppressed serfs. In his two next novels, *Rudin* (1855) and *A Nest of Gentlefolk* (1858), appear Turgenev's favorite "weak hero" and "strong heroine" types—their obvious inspiration is Pushkin's Evgeni and Tatyana. In *Rudin,* particularly, Turgenev, who was a Westerner, also showed his predilection with social problems. In *On the Eve* (1860), Turgenev tried to rid himself of the "superfluous" man type of character and create an active hero. The critics were quick to point out that the new hero, Insarov, was a Bulgarian and not a Russian. The author's final answer to the demands of the critics for an active hero was Bazarov, in his masterpiece *Fathers and Sons* (1861). Radical critics, however, condemned Bazarov as a caricature of a revolutionist. Deeply offended, Turgenev spent most of his later life abroad, and although he continued to write, his later work fell off in power. Turgenev's novels are rich in human experience and social significance; his gallery of heroines, as well as his style, are among the best in Russian fiction. His chief fault was an inability to come solidly to grips with life.

Dostoyevsky was another kind of writer, quite outside the traditional development of Russian realism. His chief debt was to Gogol, who had pioneered in philanthropic fiction; Dostoyevsky followed Gogol's lead in his preoccupation with the downtrodden and oppressed. Thus the hero of his first tale, *Poor Folk* (1846), is a miserable copying clerk, like the hero in Gogol's *The Cloak.* But unlike Gogol, who developed characters through external details, Dostoyevsky analyzes his characters from within. He is primarily interested in their souls. After publishing a series of short stories, Dostoyevsky was exiled in 1849 to Omsk, for association with a radical group; he did not return to St. Petersburg or begin writing again until ten years later. With *Crime and Punishment,* published in 1866, he won widespread fame, and the great novels that followed, *The Idiot* (1869), *The Possessed* (1871), and *The Brothers Karamazov* (1880), made him one of the most celebrated authors in Russia. His novels have been discussed endlessly in Russia and abroad; critics have found everything in them from grotesque, sensational misrepresentation of real life to the revelation of a new Christianity. His titanic characters, such as Raskolnikov, Prince Myshkin, Stavrogin, the Karamazov brothers, and the holy Zosima, undoubtedly reflect his own spiritual tragedy in the search for God. His attempts to find solutions and harmonies for his characters never seem to have the same profundity and terrible realism of their tremendous conflicts and tragedies. Yet in his novels the fusion of the philosophical and imaginative fabric is complete, and his intense inner psychological analysis of characters is unique in world fiction.

In both manner and subject matter, Leo Tolstoy reverts to the Pushkin tradition of realism, but unlike Turgenev, he was not primarily concerned, in his artistic works written before his spiritual change in 1880, with contemporary problems of social significance. Yet the original stamp of this colossal genius was placed on everything he wrote. His early works, such as *Childhood* (1854), *Boyhood* (1856), and *Youth* (1856), have the peculiar flavor of Aksakov's charming reminiscences, but they reveal a realistic grasp on the experiences of life and a potential power of character analysis far beyond the talents of the older writer. These qualities reach their height in *War and Peace* (1865–1869) and *Anna Karenina* (1875–1877). Modern realism has never equaled the achievement of *War and Peace.* Each of the more than five hundred characters has a distinct personality and speaks a distinct language. A Russian critic remarked that even the dogs in the book are individualized. Truth and simplicity, the two canons of Tolstoy's artistic faith, are scrupulously observed. And these same attributes, as well as the author's ecstatic love of life, appear throughout *Anna Karenina.* After his spiritual struggle and conversion about 1880, Tolstoy professed to turn his back on art. Nevertheless, apart from the voluminous critical, moral, and religious works that he wrote after 1880, he produced a considerable body of imaginative literature of great merit, such as *The Death of Ivan Ilyich* (1886), *The Kreutzer Sonata* (1889), *Hadji Murad* (1896–1904), and *Resurrection* (1896–1904); he also wrote several plays. Towards the end of his life he abandoned the psychological and analytical manner of his great period for a simple narrative style that would appeal to the masses. However, everything that he wrote, before and after his conversion, bore the indelible trace of his magnificent talent.

Later 19th Century Literature.—There were other 19th century realistic novelists, not in the same class with the giants, yet writers who have won a high place in Russian literature. The best novels of Aleksei F. Pisemski (1820–1881, q.v.) are *The Petersburgher* (1853) and *A Thousand Souls* (1858); the first depicts uneducated people with rugged virtues and moral strength, and the second is a satire on genteel life. Pisemski's heroes and heroines are vigorously drawn, both in his novels and in his plays. One of the great satirists in Russian literature is N. Shchedrin (real name Mikhail E. Saltykov, 1826–1889). His *Golovlev Family* (1876) is a satirical masterpiece, a social novel that portrays the sordid and crass lives of the ruble-hunting lower provincial gentry. Among many radical journalists and novelists of the 1860's the only outstanding one is Gleb Uspenski (1840–1902); his best work, *The Power of the Soil* (1882), portrays peasant life with humor and great sympathy.

A conservative rare for these times in litera-

ture, Nikolai S. Leskov (1831–1895) was the author of minor classics. His *Cathedral Folk* (1872) is an amusing chronicle of provincial life. In novels and many short stories, he paints a canvas of Russian life, its saints and sinners, always with bright colors, a strong sense of humor, and in a style rich with folk idioms. Drama too claims a high place in later 19th century literature but the same can hardly be said for poetry. The poets were torn between the necessity of writing verse that reflected the civic problems of the day and of indulging in the poet's eternal search for truth and beauty. In trying to fulfill this double mission Apolloni N. Maikov (1821–1897) and Yakov P. Polonski (1819–1898) succeeded only moderately well. Count Aleksei Tolstoy (1817–1875), perhaps the greatest Russian writer of nonsense verse, also wrote exquisite lyrics, and excellent dramas. The most celebrated realistic poet of the period, much read in Soviet Russia, was the radical writer, Nikolai A. Nekrasov (1821–1877, q.v.). His narrative poem *The Pedlars* (1863), and *Who Can Be Happy in Russia?* (1873–1876), are filled with keen, good-humored, shrewd satire and remarkable verbal power, always with undertones of poignant protest. Afanasi A. Fet (1820–1892, q.v.) was as conservative as Nekrasov was radical; his short, condensed lyrics are very beautiful.

Fiction and Poetry (1880–1900).—The towering shadow of Leo Tolstoy dominated fiction from 1880 to 1900. An early member of the new generation which he influenced was Vsevolod M. Garshin (1855–1888, q.v.), the fame of whose brief, creative life rests on his collected short stories. The most notable of these stories, particularly *The Red Flower* (1889), reveal a moral sensitivity and an infinite sympathy for the victims of man's inhumanity.

Among many minor novelists, the only one remembered is A. I. Ertel (1855–1908). His long novel, *The Gardenins* (1898) is still interesting; its picture of family life on a huge estate shows the influence of Tolstoy. Vladimir G. Korolenko (1853–1921, q.v.) was a writer of quite a different type. He was exiled to Siberia for radical activities, and he drew upon his experiences there in his tales. In stories like *Makar's Dream* (1885) he combines a delightful humor with a kind of radical idealism.

Korolenko's great rival was Anton P. Chekhov (1860–1904, q.v.), whose first collected tales met with immediate success when they were published in 1886. His mature period, however, began in 1889, with the publication of *A Dreary Story*. Here we find that mutual lack of understanding among characters and the psychological development of a mood that combine to form the "Chekhovian state of mind" so characteristic of his best-known tales, such as *The Duel, Ward 6,* and *In the Ravine*. These same qualities, along with deeper symbolic overtones, reappear in his famous plays.

Little excellent poetry was written during this decade. The most popular of the civic poets was Semyon Nadson (1862–1887). His brief creative life was dedicated to themes of reform, but he lacked imaginative power and originality of expression. His wide success must be attributed to his smooth, highly quotable, effortless verse. His rival for popular favor was A. N. Apukhtin (1841–1893), whose poetry is filled with a hedonist's regret for the lost pleasures of youth. The verse of Vladimir S. Solovyov (1853–1900, q.v.) rose above this undistinguished level. A brilliant philosophical thinker and a clever writer of nonsense verse, he was yet capable of embodying profound mystical experiences in beautiful lyrics.

Fiction After Chekhov (1900–1910).—Since radical movement of the 1880's and 1890's was driven underground by the czar's secret police, it could find no legal expression in literature. Yet a new force, Russian Marxism, had entered the struggle against autocracy, aided by a growing proletarian class. After the disastrous 1905 revolution, the Duma was established, yet the high hopes of the revolutionists were blasted. A deep disillusionment with the whole radical movement followed, reflected in literature in anti-political individualism, in the growth of aestheticism, and, in some fiction, in the growth of eroticism.

For a time the two most popular representatives of the new manner in fiction were Leonid N. Andreyev or Andreev (1871–1919, q.v.) and Mikhail P. Artsybashev (1878–1927, q.v.). Andreyev had two styles, the restrained, logical style of such celebrated short stories as *The Seven That Were Hanged* (1908), and the shrill, rhetorical style of *The Red Laugh* (1904). In general, the underlying theme of his fiction and plays was physical death and the annihilation of society, morals, and culture. Artsybashev echoed the same theme, and added that of sexual emancipation in his enormously successful and somewhat pornographical novel, *Sanin* (1907).

In striking contrast was the fiction of Maxim Gorky, (q.v., pseud. of A. M. Peshkov, 1868–1936), who raised his voice on behalf of the lost men and women of Russia's lower depths, and at the same time liberated Russian realism from its rather conservative tradition. Although Gorky began to publish long before the 1917 revolution, he lived to become the titular head of Soviet literature, which he profoundly influenced both by example and criticism. Gorky's early stories published in two volumes in 1898, reveal the cruelty and ugliness in the lives of lowly creatures he met on travels through southern Russia. The novels and plays of his second period—*Foma Gordeyev* (1899), *Mother* (1907), *Matvei Kozhemyakin* (1911)—mainly depict the vicious life of provincial Russia and the unhappy lot of oppressed workers. In his last period he devoted himself largely to superb volumes of recollections. After the Soviets came to power appeared his huge masterpiece, *The Life of Klim Samgin* (1927–1938), which presents the history of Russian life between 1880 and 1917. He draws a dark, cruel, and ugly picture, but rising above the gloom there is always a ray of hope for a better and happier country.

Around Gorky and his publishing firm Znaniye were grouped writers who reveled in outspoken realism and went as far toward revolutionary protest as the government would permit. Two of them, Vikenti Veresayev (pseud. of Vikenti V. Smidovich, 1867–) and A. S. Serafimovich (1863–1949), are popular in Soviet Russia through novels sympathetic with the ideals of the revolution. Serafimovich's *Iron Torrent* (1924) is especially popular. Some influence of Gorky appeared in the fiction of Alexander I. Kuprin (1870–1938), whose novel *The Duel* (1905) made him famous overnight. *Sulamith* (1908) and *Yama* (1910), were also quite popular, but they were less powerful. A finer artist was I. A.

Bunin (1870–), who first won notice through verse but who achieved his greatest fame as a novelist. Perhaps his best work is *Sukhodol* (1911), a story of the disintegration of a land-owning family.

The Symbolist Movement.—There was one important reaction in the 1890's and 1900's to writers such as Andreyev and Gorky, and to the dominance of social significance and nihilistic thought in literature. It took form in a definite turning away from civic morality to aestheticism, from duty to beauty. Most participators in the new movement were brilliant intellectuals like Dmitri S. Merezhkovski (1865–1941, q.v.) and his talented wife, Zinaida Hippius (1869–), N. M. Minski (1855–1937), and V. V. Rozanov (1856–1919). Merezhkovski is best known for his trilogy of historical novels (*Julian the Apostate,* 1896, *Leonardo da Vinci,* 1902, and *Peter and Alexis,* 1905), but he also played the philosopher and prophet, developing a curious antithetical approach to religion and morality. Rozanov was a critic and thinker of considerable power; his best works were *Solitary Thoughts* (1912) and *Fallen Leaves* (1913).

This emphasis on aesthetics and mysticism provided an easy transition to the remarkable symbolist movement, partly an offshoot of western European French symbolism. Valeri Bryusov (1873–1924) established the movement with a collection of poems published in *The Russian Symbolists* (1894). Though a weaver of gorgeous imagery, his verse often seems chill and premeditated. The early symbolist Konstantin D. Balmont (1867–1943, q.v.) was a more natural poet, yet there is more sound than sense in such volumes as *Under Northern Skies* (1884) and *Let Us Be as the Sun* (1903). *The Cypress Chest* (1910) by I. F. Annenski, and *Cor Ardens* (1911) by Vyacheslav I. Ivanov (1866–), were regarded in their day as fine collections of symbolist verse; the former was compressed, subtle, and precise; the latter, ornate and metaphysical. One of the most remarkable authors of the whole symbolist movement was Fyodor K. Sologub, q.v., (pseud. of Fyodor Kuznich Teternikov, 1863–1927). He was a refined poet, but is still better known for his famous novel, *The Little Demon* (1907)—its hero Peredonov has become a symbol of concentrated nastiness. Perhaps the most original, and the most difficult, of the symbolists was Andrei Bely (1880–1934), whose real name was Boris N. Bugayev. He was a brilliant critic and poet, but he too is best known for his novels, particularly *Petersburg* (1913) and *Kotik Letayev* (1920). His style in the latter suggests the works of James Joyce. An author often associated with Bely, both as symbolist and prose stylist, is Aleksei M. Remizov (1877–), whose tales (*The Story of Stratilatov,* 1909, *The Fifth Pestilence,* 1912) are of ugly provincial life, and are written in an ornamental and highly mannered prose.

In general, symbolist literature pointed in two clear directions: an aesthetic direction, emphasizing refinement of form, and a religious-mystical direction that usually involved the creation of dream worlds, often realistically described. Both tendencies fused in the work of the greatest of the symbolist poets, Alexander A. Blok (1880–1921, q.v.). His early poems (*Verses about the Beautiful Lady,* 1904) tell the history of the author's mystical "love affair" with a beautiful lady, who continued to haunt Blok's later poems as he went through a long period of black despair. After 1917, he considered the revolution as a cleansing fire that would purify the soul of Russia. This attitude found expression in his greatest poem, *The Twelve* (1918), which is a miracle of revolutionary mysticism and metrical harmony. His radical enthusiasm later gave way to disillusion and chronic despair, and he died in 1921. He was perhaps the greatest Russian poet since Lermontov.

Literature at the Beginning of the 1917 Revolution.—Blok's *The Twelve* was in a sense the swan song of symbolism. The opposition was centered in two new groups: the acmeists, led by the excellent poets, N. S. Gumilyov (1886–1921) and Anna Akhmatova (1888–), and the futurists, the chief adherents of which were Igor Severyanin (1887–1942), Velemir Khlebnikov (1885–1922), and Vladimir V. Mayakovski (1893–1930). The futurists demanded the destruction of all literary traditions in the name of a new flesh-and-blood art that would banish the pale aestheticism of the symbolists and the dry academism of classical writers. In the shadow of this blatant revolt, Soviet literature began, and it was the immensely talented futurist poet, Mayakovski, who first set his impress on the new movement.

After 1917 Mayakovski devoted all his ability and energy to the revolution; his inspiration was the "social command" that he thought every Soviet poet must obey. He wrote many short pieces and plays, but his chief fame rests on several long narrative poems (*150,000,000,* 1919, *Vladimir Ilyich Lenin,* 1924, and *Good,* 1927). He employed very remarkable sound effects and all the typographical tricks of the broken line. No Soviet poet has been more honored than Mayakovski. His only rival in popularity during those early days was Sergei A. Esenin (Yesenin, 1895–1925), who regarded himself as the "last poet of the village." He had a fine lyric gift, but was unable to adapt himself to the new order.

Out of the confusion and conflicting literary demands during the early years of revolution and civil war, certain definite tendencies began to appear. In 1917 the Proletcult was formed to direct the fight for a proletarian culture on an international scale. Two schools of thought promptly arose: (1) the moderate group, supported by prominent government officials and certain writers known as "fellow-travelers," who argued that it was impossible to create a proletarian literature by official decree, and that much of value could still be learned from bourgeois art and culture; and (2) the extremists, soon known as the "On Guard" group, who supported the idea of a government literary dictatorship and called for an uncompromising class-literature. A resolution of the Central Committee of the Communist Party in 1925 declared in favor of the moderate school, and for a time the fellow-travelers were left free to write much as they desired.

The Beginnings of Soviet Fiction.—No Soviet fiction of any consequence was written until about the time of the New Economic Policy (1922–1928). The predominant themes of this early fiction were the stirring events of the revolution and civil war, in which many of the young authors had participated. One of the first successful novels to depict revolutionary violence was *A Bare Year* (1920), by Pilnyak (1894–), whose real name was Boris A. Vogau. *The*

Armored Train (1922) and *The Partisans* (1923) by Vsevolod Ivanov (1895–), treat guerrilla warfare in Siberia. Ivanov's characters are vivid, though astoundingly primitive in their emotions and actions. The extremely popular book *Chapayev* (1923), by Dmitri Furmanov (1891–1926) is an almost documentary narrative of the famous peasant partisan, Chapayev, who commanded a division that saved Uralsk from the White forces. *Red Cavalry* (1926), by Isaak Babel (1894–), is more romantic in its treatment of violence; it is a collection of stories based on the author's experiences with Marshal Semyon M. Budyonny's Cossacks.

On the whole, this early fiction eschewed the psychological analysis of the great 19th-century Russian novelists and concentrated on straightforward realistic narrative. Soon, however, Soviet novelists began to appear who wrote on themes of revolution and civil strife, much in the manner of Leo Tolstoy, Dostoyevsky, and Chekhov. One of the first was Konstantin A. Fedin (1892–). His novel, *Cities and Years* (1922–1924), of a self-centered intellectual who eventually betrays the revolution, aroused considerable interest. The flavor of Fedin's novel suggests Chekhov, and the spiritual doubt of his hero echoes Dostoyevsky. Dostoyevsky is even more in evidence in the fiction of Leonid M. Leonov (1899–), especially in his psychological development of character (see *The Badger,* 1925, and *The Thief,* 1927).

Critics praised Leonov's fiction as a bridge between Soviet realists and classical writers of the past. In a sense the two periods are linked even more strongly in the work of Aleksei N. Tolstoy (1882?–1945), a leading literary figure of Soviet Russia. Perhaps his most distinguished novel is *The Road to Calvary* (1921–1942), which pictures Russia before, during, and after the revolution. The first novel of Alexander A. Fadeyev (1901–), *The Rout* (1926), shows the obvious influence of Leo Tolstoy in psychological insight and unrestrained realism. Fadeyev shows intimate knowledge of Siberia in *The Rout* and again more extensively in his longest and best novel, *The Last of the Udegs* (1929).

Fiction During the First Five-Year Plan. —Under the First Five-Year Plan (1928–1932) a new attempt was made to regiment literature. The Russian Association of Proletarian Writers (RAPP) fell under control of the critic L. Averbakh and a few close supporters, who dictated that the only themes suitable for Soviet writers were industrial reconstruction and agricultural collectivization under the Five-Year Plan, treated against a background of the class struggle. The results of this "planned literature" were for the most part unsatisfactory. Discontent became so great that in 1932 a government decree dissolved RAPP, and this extreme form of literary dictatorship came to an end. A general association of Soviet writers was set up to which all, Communists and non-Communists, were freely admitted.

Although most literature produced during the First Five-Year Plan hardly rose above the dull level of official propaganda or skillful reporting, a few novels had superior merit. Fyodor V. Gladkov (1883–) had in 1927 anticipated the kind of fiction encouraged under the Five-Year Plan with his enormously popular *Cement.* In 1933 he published *Power,* a story of the men and women who built Dneprostroi. In *Sot* (1930) Leonov depicts the establishment of a paper industry, and in *Skutarevski* (1933) he describes a large-scale electrification project. In both books he bores the reader with countless scientific technicalities. Yet in both he shows a typical Dostoyevskian concern for the "inner man" and his spiritual doubts. The subject of industrial reconstruction provided the theme for Pilnyak's fine novel, *The Volga Flows into the Caspian* (1931). *Time, Forward!* (1933) by Valentin Katayev (1897–), is still more lively and artistic. The theme is the competition of shock brigades in pouring cement, and the story is told with verve and excitement.

One of the greatest Soviet novelists, Mikhail A. Sholokhov (1905–), reached artistic maturity during this period. He began his long epic of Cossack life, *And Quiet Flows the Don,* in 1926, but he interrupted it to write *Soil Upturned* (1932–1933), the best novel on the theme of agricultural collectivization during the First Five-Year Plan. Sholokhov finished the *And Quiet Flows the Don* in 1940; the book covers eight years of its hero's experiences and development during the First World War, the revolution, and the civil war. It is an intensely moving story of a man's weakness and strength, and reflects the influence of Leo Tolstoy's wonderful sense of realism and simplicity of character delineation.

Meanwhile, up to this point there was no lack of criticism of Soviet life in fiction. Satire aimed against the vices, foibles, and absurdities of Soviet officials was freely tolerated, provided it did not attack the accepted principles of the new order. Among the best-known satirists in fiction are E. I. Zamyatin (1884–1937), Ilya Ehrenburg (1891–), and Mikhail A. Bulgakov (1891–1940). Katayev's *The Embezzlers* (1928) is a delightful satire on two naively peculating Soviet officials. A number of humorous, popular satires were written by that devoted pair of collaborators, Ilya Ilf (d. 1940) and Evgeni Petrov, whose real name was Evgeni P. Katayev (1903–1942). The most widely read Soviet humorist, however, is Mikhail Zoshchenko (1895–), who has published about ten volumes of short stories and novels. Beneath his humor there is always a deft criticism of the abuses of Soviet life.

Nor were ethical problems—the conflict of the new communist conscience and ideals with traditional views of sex, love, marriage, and the family—neglected in fiction produced during the First Five-Year Plan and even earlier. Two older writers who wrote on such problems were S. N. Sergeyev-Tsenski (1876–), and Panteleimon Romanov (1884–1936). Yuri Libedinski (1898–), in his later works, concerns himself with ethical and social problems, especially in his finest novel, *The Birth of a Hero* (1930); and so does Yuri Olesha (1899–) in his much discussed novel, *Envy* (1927).

Soviet Poetry.—Mayakovski's insistence in the years after 1917 on the socialist function of verse deeply influenced later Soviet poetry. Young authors followed his advice to write poetry that grew out of their participation in social creation and life. Poets, however, like the novelists, were soon split into factions by the conflicting demands made by their communist conscience and by "social commands." Demyan Bedny (1883–1945), an older writer regarded as a kind of poet laureate in the early days of the revolution, was

untroubled by these conflicts; much of his ephemeral verse was satirical and humorous commentaries on Soviet daily life.

Many of the young proletarian poets under Mayakovski's influence, however, often lost themselves in the factional strife. They professed contempt for Russian bourgeois literature of the past; their devotion was to the Communist Party and its aims. One of the first of them, and for a time the most popular, was A. I. Bezymenski (1898–). He wore his party card, he declared, not on his sleeve, but in himself; he asserted in one of his best-known volumes of verse, *That is How Life Smells* (1924), his only real concern was for proletarian realities. After the dissolution of RAPP in 1932, Bezymenski and his strident leftism lost favor. Others among this group of young proletarian poets were Alexander Zharov (1904–), Nikolai Ushakov (1899–1949), Mikhail Golodny (1903–1949), Ivan Doronin (1900–), and Mikhail Svetlov (1903–). Vasily Kazin (1898–), was more talented and wrote in a more genuine proletarian vein. The chief follower of Mayakovski is Nikolai Aseyev (1889–). He honored his master's memory in a long poem, *Mayakovski Begins* (1940), which strengthened Aseyev's position as one of the foremost poets of Soviet Russia.

Constructivism, a somewhat vague movement that developed out of futurism, has for its principal poetic adherent Ilya Selvinski (1899–). Somewhat influenced also by this movement was Eduard Bagritski (1899–1934), a highly talented poet with a fine lyric gift. The "poet's poet" of Soviet Russia, and certainly one of the most distinguished figures in literature, is Boris L. Pasternak (1890–), who began his career under the influence of the Futurists. His long narrative poems, such as *Spektorski* (1926) and *The Year 1905* (1927), seem uncongenial to his special lyric genius, which is more in evidence in his shorter pieces. He is very much of an individualist, and although his language is often obscure and unorthodox in its syntactical structure, it is brilliantly successful in rhythmical effects. An entirely different poet, though sometimes thought of as Pasternak's chief rival, is Nikolai Tikhonov (1896–). From the time of his earliest verse tales (*The Horde,* 1922, *Mead,* 1923) to his later ballads on civil-war themes and his recent poems, Tikhonov has developed his art in an independent fashion, largely as a medium for treating romantic subjects realistically.

In general, Soviet poets have lagged behind fiction writers; they seemed unable to adapt themselves as easily to the new demands made upon literature by the state. The discipline of verse is more severe, and it takes a longer time for forms to crystallize and for faith to take root in the poetic consciousness. The Second World War brought to fuller realization the earlier promise of poetry. Something of a renaissance took place in Soviet war poetry; the older poets are being paced by newcomers such as Konstantin Simonov and Alexander Tvardovski—the latter gained fame even before the war by his brilliant long poem *Muravia Land.* There has been a definite transition from the often difficult, futuristic language of prewar poetry to a simple, uninvolved poetical style, especially in many of the lyrics and ballads on war themes.

Soviet Literary Criticism.—After the 1917 revolution, the old schools of historical-comparative and religious-philosophical literary criticism gave way to sociological and Marxist criticism, which examined literature from the point of view of social and economic evolution. Even earlier a less purely Marxian approach had been formulated by such critics as Georgi V. Plekhanov (1857–1918), V. M. Friche, P. S. Kogan, V. L. Lvov-Rogachevski, and A. A. Bogdanov. Bogdanov became the principal theorist of the Proletcult and was the author of *Art and the Working People* (1918).

This early Marxian literary criticism split into a Right wing (Leon Trotsky, q.v.), Vyacheslav P. Polonski, A. Voronski, I. Lezhnev, and A. V. Lunacharski), and a Left wing (G. Lelevich, G. Gorbachev, and L. Avervakh). Both wings accepted the doctrine of historical materialism, and the critical method of both groups was to interpret literary works through an analysis of the economic and social structure of society. Their differences largely lay in the relative importance of these factors. V. Pereverzev and his followers proposed a variation in the Marxian approach: they maintained that literature became essentially a manifestation of the economic productive process in which every aspect of an author's creative art inevitably will reflect the economic laws of the period in which a writer lives. This approach was quickly condemned as a vulgarized kind of Marxism.

The most serious opponents of the Marxists in literary criticism were the formalists. Most of them are men of brilliant scholarly attainments, and their published works are confined largely to investigations of poetic speech and problems of style (consult B. V. Tomashevski, *The Theory of Literature,* 1925; I. Vinogradov, *The Struggle for Style,* 1937; P. Medvedev, *Formalism and Formalists,* 1934). Their general thesis is that a work of art is the sum of the devices in it, and that "form creates its content."

Since 1932, the universal touchstone of Soviet literary criticism has been "socialist realism." The interpretation and application of the term vary. In its primary sense, socialist realism means a realism that is socialistic, reflecting socialist realities and a socialist mentality. Some later Soviet critics insist, however, that socialist realism must rest on socialist humanism. (See explanation of socialist humanism in USSR-*Philosophy.*) This concept is intended to broaden and ennoble the aims of art. Thus Soviet literature inspired by socialist realism is essentially optimistic: it defines existence as activity, it strives to integrate literature and life, and it directs the changing present towards a more creative future.

Recent Trends in Soviet Literature.—Since 1932 there has been less emphasis in Soviet literature upon themes dictated by "social commands," and greater emphasis upon permanent values and universal constants of human behavior. Although in the fine novels of, let us say, Nikolai Ostrovski (1904–1936), such as *Those Born by the Storm* (1936) and *How the Steel Was Tempered* (1937), a communist conscience is still omnipresent, the works of many other novels give way to more commonplace emotions and human values.

Enthusiasm has increased for historical fiction in which a Marxian approach is employed to reinterpret the past to conform with the present. Historical documentation is usually very careful

and scholarly, and some of the novels are very interesting. In the brilliant historical novel *Peter I* (1929–1934), A. N. Tolstoy, treats the period of the famous czar as one of transition, symbolically parallel to the period of tremendous upheaval in Soviet Russia. Other noteworthy examples of this genre are *Stenka Razin* (1927) by Aleksei Chapygin (1870–), *Tsusima* (1934) by A. Novikov-Priboi (1877–), and *The Brusilov Breakthrough* (1941) by Sergeyev-Tsenski. The historical novels of Yuri Tynyanov (1894–) are quite different. They attempt to re-create literary figures of the past and the age in which they lived (*Kukhlya,* 1925, *The Death of Vasir Mukhtar,* 1929, *Pushkin,* 1934). In most historical novels the patriotic motive is strong, with emphasis on the heroism of the past as an example for the Soviet present. During the Second World War this trend developed into the most violent patriotism. Two themes predominated in numerous war stories, poems, and plays that appeared after June 1941: love for the native soil and bitter hatred for the enemy. Like war literature in other countries, an emotion of fatalism was also apparent.

Since the war, the Central Committee of the USSR Communist Party has severely condemned several prominent Soviet writers for alleged bourgeois tendencies, and has ordered current literary efforts to be more communistic.

3. DRAMA. Early Drama.—Although the Russian theater has earned a high reputation in western Europe and America, Russia has never produced a body of dramatic literature comparable to Elizabethan drama or the great age of Corneille, Racine and Molière in France. Nor is Russian drama as a whole comparable to the notable body of Russian realistic fiction. Yet some Russian plays merit a place beside the outstanding dramas of world literature, and a number of others are nearly as great.

The earliest Russian drama was imported from the West. Latin school dramas on religious themes were introduced into west Russian schools before 1600, and reached Moscow shortly after. Most of these school dramas were influenced by the medieval miracle and mystery plays. When not performed in the original Latin, they were translated from Latin or from Polish. The only originality in the Russian adaptations is in the comic interludes, where Ukrainian types—the Cossack, the clerk, and the braggart Pole—were introduced. Prelates and clerics brought this school drama from Kiev to Moscow, and before long strolling bands of student actors took it out of the schools and began performing in many parts of Great Russia. The school drama, however, never became widely popular. For one reason, it soon met the rivalry of a second importation from the West—secular plays of German origin. These had a great influence on the history of Russian drama.

A German Lutheran pastor, Johann Gottfried Gregori, living in the German suburb of Moscow, gave the first impetus to this new dramatic development during the reign of Czar Aleksei (1645–1676). In 1672 Gregori organized a troupe of actors to perform before the czar. For repertoire he drew upon printed collections of the plays of German strolling companies which he had known in his youth. These plays in turn had been largely borrowed from the repertoire of companies of English actors performing in Germany. Among the plays selected by Gregori for translation and performance were *The Comedy of Queen Esther and the Haughty Aman* (acted in 1672), which was very likely based on an English interlude, and *Temir Aksakovo* (acted in 1674), which unquestionably had as its ultimate source Christopher Marlowe's (q.v.) *Tamburlaine the Great.*

Under this new impetus, Simeon of Polotsk

wrote a play in rhymed syllabic verse, *Action of the Prodigal Son,* and in the last years of the 17th century the rhymed school drama became predominant. But under Peter the Great secular prose plays translated from the German again came into vogue, supplemented by translations of a few of Molière's dramas. Public theaters were opened, and the old school plays were now played only in the seminaries and academies.

There is little literary worth in any of the early prose dramas, but some literary merit and originality can be claimed for the verse drama. The verse plays of St. Demetrius Tuptalo of Rostov and of Feofan Prokopovich (1681–1736) were real contributions to Russian drama. For example, in the *Nativity Play* of St. Demetrius the dialogue of the shepherds before the apparition of the angels is most attractive for its quality of quaint humor in dealing with things solemn and holy. *Saint Vladimir* (1705) by Prokopovich, a tragi-comedy on the theme of the introduction of Christianity into Russia, is almost classical in conception, and the verse represents the highest poetic level achieved at this time.

Eighteenth Century Drama.—The continuous history of both the Russian theater and drama really begins with Alexander P. Sumarokov (1718–1777) during the reign of Elizabeth (1741–1761). Sumarokov's tragedy, *Khorev,* though influenced by outside sources, was the first Russian play. It was acted before the empress in 1747. To encourage this dramatic development, Elizabeth established the first permanent Russian theater (1756) at St. Petersburg, with Sumarokov as director. Its leading actor was Fyodor G. Volkov (1729–1763), a Yaroslavl merchant who had earlier organized a local troupe of players. Volkov began the great tradition of Russian acting; he was soon ably supported by the famous tragic actor, Dmitrevski (1734–1821), who is said to have studied under Garrick. Excellent acting rendered the poor plays of Sumarokov acceptable, as was so often to be the good fortune of later Russian dramatists. Sumarokov wrote several comedies and tragedies, but they are for the most part slavish imitations or mere adaptations of French neoclassical pieces. Critics called him the "Russian Racine," a sobriquet which perhaps bears less of compliment than implication of plagiarism. He even adapted *Hamlet,* but proudly denied strict adherence to his famous model, declaring: "My *Hamlet,* except for the monologue at the end of the third act and the praying of Claudius, hardly resembles the tragedy of Shakespeare." Yet Sumarokov's efforts have won him the title of "father of Russian drama." He did much to popularize in Russia the best plays of Pierre Corneille, Jean B. Racine, Molière, and Voltaire (qq.v.).

The new interest in drama and theater was furthered by Catherine the Great (1762–1796), who dabbled in playwriting herself. She wrote several satirical comedies, something that passes for a translation of *The Merry Wives of Windsor,* two historical plays that are classified as "imitations of Shakespeare," and still another play that was inspired by *Timon of Athens.*

Little good tragedy was written during Catherine's reign, except for *Vadim* (1789) by Yakov Knyazhnin (1742–1793), which breathes a revolutionary spirit of political freethinking. Comedy, still largely influenced by the French neoclassical manner, but now with a firmer grasp on the realities of Russian life, predominated. Knyazhnin, an imitator of Voltaire, was a prolific writer of comedies, which on the whole are superior to his tragedies. They usually make excellent theater, but are not first-rate in character drawing and dialogue. Perhaps his best comedies are *The Queer Fellows,* a satire on Russian Gallomania, and *An Accident with a Carriage,* a bold satire on serfdom. Even better as dramatic satire is the famous comedy *Chicane* (1798) by Vasili Y. Kapnist (1757–1823). This play is a vicious attack on officers of the law, who are painted as thieves and extortioners. Worthy of mention also are the comedies and comic operas, particularly *The Miller Wizard, Quack and Matchmaker* (1799), of Alexander A. Ablesimov (1742–1783).

The greatest dramatist of the 18th century was Denis Fonvizin (1744–1792). His reputation rests upon two comedies, *The Brigadier-General* (1766) and *The Minor* (1782), which have won him a place among the foremost Russian playwrights. Both are in prose and reflect the influence of neoclassical French comedy, although Fonvizin's immediate model was the Danish dramatist Ludwig Holberg (q.v.), whom he had read in German. *The Brigadier-General* is a social satire directed against the fashionable French semieducation so prevalent in Russia at the time. It is well constructed and full of carefree amusement. Fonvizin's masterpiece, *The Minor,* is more serious, though less well constructed. This too is a social satire, and in the typical neoclassical fashion contains a conventional and uninteresting subplot. Attention is centered on the main plot and the vicious members of the Prostakov family: the domineering bully of a mother, her sheepish husband Prostakov (Mr. Simpleton), her furious brother Skotinin (Mr. Brute), and her son Mitrofan, who typifies brutal selfishness. The satire of the comedy is directed against the crude, barbaric natures of uneducated country gentry. Both character drawing and dialogue are superior, and strike a realistic note that was to be heard again in the best comedy of the 19th century.

Drama During the First Half of the 19th Century.—At the turn of the century there was little progress in the development of drama. French neoclassicism gave way to a taste for sentimental plays, but no original work of value was written in this vein. Ivan A. Krylov (1768–1844, q.v.), wrote two rather successful satiric comedies, but the two most popular plays on the Russian stage were translations from the German melodramatist, A. F. F. von Kotzebue (q.v.). The outstanding native dramatist of the early 19th century was Vladislav Ozerov (1770–1816). His sentimental verse tragedies, such as *Fingal* (1805) and *Dmitri of the Don* (1807), owed their tremendous success to superb acting by Catherine Semenova, one of Russia's greatest tragic actresses.

During the first half of the 19th century four famous authors wrote plays; two of them wrote plays of supreme merit. Two of these authors, Alexander S. Pushkin (1799–1837), and Mikhail Y. Lermontov (1814–1841), were primarily poets. The third, Nikolai V. Gogol (1809–1852), was essentially a novelist, and only the fourth, Alexander S. Griboyedov (1795–1829, qq.v.), was solely a dramatist. Pushkin's first and longest play, *Boris Godunov* (1825), was an experiment —an attempt to write a Russian Shakespearean

tragedy as a departure from the prevalent French neoclassical form. It is an historical play on the theme of Czar Boris Godunov, written in blank verse. Despite scenes of real dramatic beauty, and occasional passages of stirring poetry, the play was not one of Pushkin's most mature performances. It has never won a secure place on the Russian stage. Pushkin's so-called "little tragedies" *Mozart and Salieri* (1830), *The Feast During the Plague* (1830), *The Covetous Knight* (1836), and *The Stone Guest* (1836), are more interesting and on a much higher level of perfection. They were not intended for acting, but were rather essays in the understanding of character and of dramatic situations: as such they leave little to be desired, either as poetry or drama. Mikhail Y. Lermontov (1814–1841, q.v.) had less merit than Pushkin as a dramatist. As a mere youth he wrote three prose plays that deal with high-strung passions and melodramatic situations. His verse play, *The Masquerade* (1835), has more worth, but it is too melodramatic and the characters barely come alive. The play was revived with some success in Soviet Russia.

There are critics who insist that Nikolai V. Gogol's (1809–1852, q.v.) *Revizor* or *The Inspector-General* (1836) is the greatest play in the Russian language. Certainly it is one of the greatest. The general theme, supplied to Gogol by Pushkin, of the hero who is mistaken by the people of a town for a government inspector, is developed with unerring art from beginning to end. As a piece of theater, it is perfectly constructed. Gogol's originality, against the background of contemporary drama, is shown by the complete absence of the traditional love element and of any sympathetic characters. The play is a moral satire directed against corrupt and despotic officials. The characters are superbly drawn, and the dialogue with its comic intensity is the most effective, with perhaps one exception, in the whole range of Russian drama. The lasting popularity of this play rests in part on an underlying symbolism which makes the speech and actions of its characters timeless despite their local application. Less known but almost as great is Gogol's comedy *Marriage* (1842), which has more exuberance and pure fun in it than the *Revizor*.

The reputation of Alexander Griboyedov as one of the greatest Russian dramatists rests on one play, *Woe from Wit*, which he wrote in Tiflis in 1822–1823. The play belongs to the French neoclassical school of comedy and recalls at once the manner of Molière. Like Fonvizin, who wrote in the same vein, Griboyedov stresses characters and dialogue at the expense of plot, which is loosely constructed. But in characterization and dialogue in comedy, only Fonvizin and Gogol can be compared to him. The dialogue is unique in Russian drama. It is in rhymed iambic verse of variable length, but the author never allows a rebellious metrical form to spoil the effect of everyday conversation. The dialogue is full of brilliant wit, epigrams, and repartees, and it has provided more clever quotable lines than any other single work in Russian literature. Its characters, such as Famusov, Molchalin, Repetilov, and the famous hero Chatski, have become household words for the universal human traits that they represent.

Drama During the Second Half of the 19th Century.—The remarkable realistic development in fiction during the second half of the 19th century was accompanied by a similar realistic movement in acting and in playwriting. The famous actor Mikhail Shchepkin (1787–1863) had already established the great tradition of Russian realistic acting, which was eventually developed into a theory of theatrical art by the celebrated actor and producer K. S. Stanislavski (1863–1938), in his great Moscow Art Theater, founded in 1898. In its later development Russian scenic realism concentrated on social realism, on truth to the particular, on the least universal and most individual aspects of a given social milieu. All this found its first complete expression in original drama in the plays of Alexander N. Ostrovski (1823–1886, q.v.), the greatest professional Russian dramatist.

Between 1847 and 1886 Ostrovski wrote about forty plays in prose and eight in blank verse. Although of unequal merit, this collection is the most remarkable body of dramatic work in Russian. Dramatists like Griboyedov and Gogol may surpass him in literary genius, but Ostrovski created a school of Russian drama. With few exceptions, his plays are neither tragedies nor comedies; they are best described as "tragicomedies." Though not a master of language, his dialogue is always adequate. Nor is he much of a psychologist, yet his characters have the individuality and uniqueness that we recognize in our fellow creatures. Where he is supreme is in the breadth, the grasp, and variety of his vision of Russian life and in his ability to recreate this life on the stage.

The subject matter of his early and most characteristic plays is the life of Moscow and provincial merchants, and the lower strata of the official world. Ostrovski's first play, *The Bankrupt* (1849), was a sensational success, and it revealed at once his peculiar and rather original technique. He presented only unsympathetic characters, and he boldly discarded the ancient tradition of comedy—the poetic justice that punishes vice. His realism avoids both caricature and farce; it is based on solid first-hand knowledge of the life described. He resorted to no theatrical tricks in order to achieve effects. All these traits were strengthened in the successful plays that soon follow: *The Poor Bride* (1852), *Poverty Is No Crime* (1854), and *The Profitable Post* (1857). The play generally considered his masterpiece is *The Storm* (1860). It is the most poetic piece he ever wrote, a great poem of love and death, of freedom and thraldom. The inevitable tragedy of the heroine grows out of the dark, oppressive forces of Russian provincial life at that time. Notable later plays are *Enough Simplicity in Every Wise Man* (1868), *The Forest* (1871), and *Wolves and Sheep* (1877).

The only two contemporary dramatists who approach Ostrovski's art are Alexander V. Sukhovo-Kobylin (1817–1903) and Aleksei F. Pisemski (1820–1881, q.v.). The best of the former's three plays is *Krechinsky's Wedding* (1855), a pure comedy of picaresque intrigue, in which the rogue triumphs over the stupidity of the virtuous character. The two chief rogues, Krechinsky and Rasplyuyev, are among the most memorable in Russian dramatic literature, and the play has a secure place in Russian repertoire. The two other comedies, *The Affair* (1869) and *The Death of Tarelkin* (1869), are brutally cynical satires. Pisemski, essentially a

novelist, began his dramatic career with comedies. But his most memorable work is one of the great tragedies in Russian dramatic literature, *A Hard Lot* (1860). The subject concerns the seduction by a squire of the wife of one of his serfs; the husband murders his wife and gives himself up to the law. The human conflict between the squire, who is legal master of the husband, and the husband, who is legal master of his wife, is worked out powerfully with a tragic inevitability that is classical in quality.

The great realistic novelist, Ivan S. Turgenev (1818–1883), ranks perhaps next to Pisemski as a playwright, though some critics give this position to Leo Tolstoy for his dramatic works. Early in his career, Turgenev thought he might devote himself entirely to drama. His plays belong to the years 1843–1852. They are largely experimental gropings after an adequate form of expression. The most actable is *The Provincial Lady* (1851), a light comedy with delicate characterizations. *A Month in the Country,* a more interesting play, is a psychological study on the old theme of rivalry in love between a mature woman and a young girl. In its undramatic nature it is a forerunner of Anton P. Chekhov's plays.

In the extensive literary production of Leo (Lev) Tolstoy (1828–1910, q.v.), drama was merely incidental. Yet he wrote several plays, one or two of which have an enduring place in the great dramatic literature of Russia. He succeeded though he possessed few of the essential qualities that make a dramatist. On the lighter side are *The Contaminated Family* (1863), a delightful satire on the young generation and a little masterpiece of character drawing and dialogue; the *First Distiller* (1886), a humorous antiliquor morality play; and *The Fruits of Culture* (1889), an amusing social comedy which satirizes the vogue of spiritualism. But the best known and greatest of his plays is *The Power of Darkness* (1887), a realistic tragedy of peasant life. The play embodies a favorite conviction of Tolstoy, the evil-begetting power of every evil action. Although superfluous details clutter up the action, there are great moments in the play, particularly the impressive third act where we see Nikita enjoying the first joyless fruits of his initial crime. Two more plays of Tolstoy are worthy of comment: *The Light That Shines in Darkness* (begun early in the 1880's and continued in 1900–1902 but never finished), and *The Living Corpse* (1900). The first draws on Tolstoy's life, for it concerns a Tolstoyan moralist surrounded by an unsympathetic family. *The Living Corpse,* in point of view, is rather unique for Tolstoy; it reflects the mellow attitude of a kindly old man, free from Tolstoy's customary dogmatic moralizing, and full of sympathy for the abandoned drunkard in the play and even for the proud society mother. The dialogue in both these plays is remarkably true to the society speech of the time.

The second half of the 19th century saw a revival of metrical historical plays, largely under the belated influence of Pushkin's *Boris Godunov.* In general all these plays are characterized by mediocre blank verse and by failure, despite often careful research, to catch the flavor of old Russia, from which most of the themes were drawn. The movement was begun by the poet Leo A. Mei (1822–1862) in his *Maid of Pskov* (1860), a conventionally pretty drama of the time of Ivan the Terrible. Between 1862 and 1868 Ostrovski also tried his hand at a series of chronicle plays; these often dramatize history interestingly, but the verse is flat and the characters are wooden. The best of these historical dramatists is Aleksei K. Tolstoy (1817–1875) whose famous trilogy, *The Death of Ivan the Terrible* (1866), *Czar Fyodor* (1868), and *Czar Boris* (1870), deserves its high reputation. The historical material is skillfully handled, the character drawing is adequate and sometimes brilliant, and the blank verse is superior to that in other contemporary historical plays.

Drama and Theater on the Eve of the Revolution.—The founding of the Moscow Art Theatre in 1898 by Stanislavski and Vladimir Nemirovich-Danchenko ushered in a new development in Russian theater and drama. One of the first productions of the new theater in 1898 was Chekhov's *The Seagull.* Anton Pavlovich Chekhov (1860–1904, q.v.) had written his first play, *Ivanov,* in 1887 and had followed up its success with several one-act comedies. In 1895 he wrote *The Seagull,* which was acted the next year in St. Petersburg. The performance was an utter failure, for neither director nor actors understood the play, and Chekhov vowed to abandon drama. Stanislavski's performance, however, in 1898, was a triumphant success, and Chekhov turned with new energy to writing plays. There soon followed *Uncle Vanya* (1900), *The Three Sisters* (1901), and *The Cherry Orchard* (1904), all of them striking successes. These four plays constitute Chekhov's theater and represent quite a new direction in drama, although their undramatic nature had been partly anticipated by Ostrovski and Turgenev. There is no subject matter in Chekhov's plays, no plot, no action. In certain essentials the plays resemble his short stories. In a sense there is no hero or heroine; all the characters are equal. And the dialogue Chekhov employs is admirably suited to the expression of one of the favorite ideas of his tales—the mutual unintelligibility and strangeness of human beings who make no effort to understand each other. Further, his plays are steeped in emotional symbolism, and the dominant note is one of gloom, depression, and hopelessness. Stanislavski's style of directing suited perfectly the peculiar nature of Chekhov's plays, and undoubtedly accounted for a good deal of their initial success on the stage. The Moscow Art Theatre specialized in naturalistic realism, dispensed with all theatricality, abandoned the "star" system of acting, and concentrated on bringing out the inner biography of each character.

Chekhov's highly original drama quickly inspired imitators, but almost all imitations of Chekhov are bad. One of the first was Leonid Andreyev (1871–1919, q.v.), who wrote about a dozen plays, several of which are still played. His Chekhovian realistic plays of Russian life, such as *Towards the Stars* (1906), *Days of Our Life* (1908), *Anfisa* (1910), and *Gaudeamus* (1911), are very poor Chekhov. He showed more originality, however, in another group of plays, which are symbolical dramas in a conventional setting, such as *The Life of Man* (1907), *King Hunger* (1908), *Black Masks* (1909), *Anathema* (1910), and *He Who Gets Slapped* (1914). *The Life of Man* and *He Who Gets Slapped* won considerable success both in Russia and abroad. There is a curious avoidance of

real life in his plays, and the rhetorical prose and gaudy colors weary both the ear and eye. But their melodramatic effects often make for good theater, and for a time their philosophy of vanity, death, and the falseness of everything human had vogue. There is something of the Chekhovian atmospheric details in the plays of Mikhail P. Artsybashev (1878–1927, q.v.), although he was additionally influenced by Strindberg. His psychological problem dramas, including *Jealousy* and *War,* are rather crude but they act well.

Maxim Gorky (Maksim Gorki) (1868–1936, q.v.), whose dramatic efforts continued well into the period after the 1917 revolution, began as a patent follower of Chekhov. He wrote fifteen plays, but only two or three won outstanding success on the stage. His first play, *The Petty Bourgeois* (1901), was a bitter picture of a middle-class family and a revolutionary engine driver. It was eclipsed by *The Lower Depths* (1902), which won sensational fame in Russia and abroad. This play is a penetrating study of different types of human derelicts in an underground night's lodging. Gorky's dramatic system resembles Chekhov's. The four acts, undivided into scenes, the absence of action, and the exaggerated development of conversations on the meaning of life—all these suggest Chekhov. The conversations particularly, but also the extraordinary realism of the settings and the unique characters, won unbounded applause for *The Lower Depths,* especially abroad. Succeeding plays: *Suburbans,* (1904), *Children of the Sun,* (1905), *The Barbarians,* (1906), *Enemies,* (1907), *Vassa Zheleznova,* (1911) won no great success. However, *Yegor Bulychev and Others* (1932) was extremely well received in Soviet Russia. Its theme is the death of a capitalist on the eve of the revolution.

Soviet Russian Drama and Theater.—Theatrical development in Soviet Russia has continued and even surpassed the finest traditions of the prerevolutionary period; the Russian theater today is perhaps the most vital in the world. Recognizing the educational and cultural value of the theater, the Soviet government gave every encouragement to the theater arts, and millions of people who had never witnessed a play before became constant theatergoers. There has been a great expansion and development of theatrical schools, theories of acting and staging, and other phases of the theater. The Moscow Art Theatre took a new lease on life after 1917, and other now famous theaters developed individual theories of dramatic art—the Meyerhold Theatre, the Vakhtangov Theatre, the Kamerny Theatre, and the Realistic Theatre.

Playwriting has hardly kept pace with the art of the theater, yet the Soviet plays written since 1917 are not markedly inferior in quantity or quality to those of any other nation in western Europe or America during the same period. Soviet drama, like fiction or poetry, has mirrored the swift political, social, and economic changes in the Union of Soviet Socialist Republics. Most of the dramatists first on the scene, such as Aleksei N. Tolstoy (1882?–1945), K. A. Trenev (1878–), Anatol V. Lunacharski (1875–1933), B. S. Romashev (1895–), and Sergei M. Tretyakov (1892–), belonged to the intelligentsia, and some had written plays before the revolution. Several novelists who also wrote plays belong to this group and some have gained a permanent place in the Soviet theater. Varied tendencies, futuristic, romantic and realistic, feature the plays of the early Soviet period.

A second group of dramatists, some of proletarian origin, wrote plays mainly on civil war themes. These were frequently poorly executed propaganda plays. Among them are *The Echo* (1924) and *The Storm* (1926) by V. N. Bill-Belotserkovski, (1884–), and *The Band* (1924) by F. V. Gladkov.

Playwrights with postrevolutionary training make up the third group; a few of them have written plays of enduring worth. Of particular significance are Alexander N. Afinogenov (1904–1941), Vladimir M. Kirshon (1902–), Nikolai F. Pogodin (1900–), and V. V. Vishnevski. Some of their outstanding plays are Afinogenov's *Fear* (1931) and *The Town of Dalekoye* (1935); Kirshon's *Bread* (1931); Pogodin's *Tempo* (1930) and *Aristocrats* (1935); and Vishnevski's *First Cavalry Army* (1930).

The tendency in Soviet drama, as in fiction, has been more and more toward realism, and attempts were made to treat the problems and conflicts that grew out of the changing Soviet life. Straight propaganda plays, such as V. V. Mayakovski's *Mystery-Bouffe* (1921) and *The Bedbug* (1929), and Sergei M. Tretyakov's *Roar China!* (1926)—the last a crude drama of foreign imperialism—soon wearied the audiences. A few of the civil war plays, especially the *Armored Train* (1927) of V. V. Ivanov (1895–), Mikhail Bulgakov's (1891–1940) *Days of the Turbins* (1926), and Trenev's *Lyubov Yarovaya* (1926), were well constructed and well acted.

A portion of the great body of literature written during the First Five-Year Plan, was drama. The plays of this period suffered from the monotonous and didactic propaganda patterns enforced by the dictatorial heads of RAPP (Russian Association of Proletarian Writers), who required writers in all literary forms to contribute their skill to the tremendous drive for industrial reconstruction and agricultural collectivization. A few of these forthright propaganda dramas, however, were good plays; for example, Afinogenov's *Fear,* which attempts to solve in terms of individual and not mass psychology the moral problem of revolutionary terror. N. F. Pogodin's *Tempo* (1930) and V. M. Kirshon's *Bread* (1931) were also superior to the average Five-Year Plan dramas, despite shortcomings in construction and dialogue.

In more recent Soviet drama the realistic trend has continued. Effective anti-Nazi plays appeared both before and after the Nazis came in to power. Many of the later Soviet plays show deeper understanding of the individual's problems in a collectivist society. The didactic element has not been eliminated, but dramatists are growing more concerned with the causes and effects of universal human behavior. Contemporary dramatic concern with the past of the Russian people is reflected in historical plays, often dramatizations of famous novels, such as Leo Tolstoy's *War and Peace* and Aleksei N. Tolstoy's *Peter I.* This trend continued after the German invasion of 1941; other plays treated immediate war themes with stark realism. Among these were Konstantin Simonov's *The Russian People,* Leonid Leonov's *Invasion,* and

Alexander Korneichuk's *The Front* and *Guerrillas of the Ukrainian Steppes.*

4. MUSIC. Folk Music.—Russian music is at least one thousand years old. The first folk melodies of European Russia date from the 10th century; Asiatic Russia did not come into the national cultural complex until centuries later. The most ancient Russian folk songs are entirely *sui generis;* for the first great alien influence, from Byzantium, was a factor affecting Russian religious music only. Russian folk song collectors have gathered and published so much authentic musical material during the last century and a half that the record of traditional Russian folk songs is now remarkably complete.

Peter Sokalski (1832–1887), in his book *Russian Folk Music in its Melodic and Rhythmic Structure* (Kharkov 1888) summarizes the essential characteristics of ancient Russian folk songs in these four points: (1) the melodic motion of Russian folk songs is predominantly descending; (2) the range of folk modes varies from as narrow as a fourth to as wide as an octave and a fourth; the older the song, the narrower the range; (3) the intervals of the fourth and fifth determine the modulation to the new keys; (4) in ancient Russian folk music, only three tones are used, a whole tone, and a tone and a half, adding up to the interval of the fourth.

The rhythm of Russian folk songs is determined by characteristic groupings of two short notes followed by a long note—the most familiar example is the *Song of the Volga Boatmen.* As for metrical arrangement of musical phrases, Russian folk songs have a large incidence of uneven metrical units (such as 5, 7, or 11) to a musical phrase. Great Russian composers have used such typical time-signatures as 5/4 (Glinka), 7/4 (Borodin), and 11/4 (Rimski-Korsakov).

The first collection of Russian folk songs, *Collection of Simple Russian Songs With Notes,* was compiled and published (1782) by Vasili Trutovski, a singer at the court of Catherine the Great. A more important collection was made by the Russianized Czech Ivan Prach, of 150 songs noted down for him by Nikolai Lvov, a musical amateur. Its publication in 1790 found immediate response, and a second edition appeared in 1806. The famous Italian composer Giovanni Paisiello (q.v.) expressed amazement at the beauty of these songs created by simple peasants, and Ludwig van Beethoven (q.v.) incorporated themes from them in his String Quartet, Opus 59, which he dedicated to Count Andreas Razumovski, the Russian ambassador to Vienna. More songs were collected and classified during the 19th century. The most significant collection was by N. Palchikov (Moscow 1888); he published 125 melodies with texts, all gathered in the village Nikolayevka, in Ufa Province. Palchikov gives as many as eight versions of each song, enough to permit general deductions as to the chief characteristics of Russian folk music. Harmonizations of Russian folk songs published by Balakirev (1886), Rimski-Korsakov (1877), Tschaikovsky [Chaikovski] (1868); Lyadov (1894) and others, further increased the interest in the subject.

The beginning of scientific musical ethnography was made by Evgenie Lineva, who was first to use the phonograph in recording Russian folk songs. She published, in 1905 and 1912, two volumes of transcriptions of Russian folk songs under the general title *Peasant Songs of Great Russia in Folk Harmonizations Transcribed from Phonograms.* Each song begins with a solo, and is followed by a chorus in which the basic melody is freely embellished. The choruses usually have two or three individual parts, but Lineva found some four-part singing. She believed that Russian folk music is essentially polyphonic, but there is no proof that the ancient songs were anything more than single musical phrases, without secondary parts. The later polyphony of peasant choruses may have been the influence of part singing in the church choirs.

Musical ethnography continued to advance after the 1917 revolution. Numerous collections of regional songs have been published under the auspices of the Academy of Sciences, in the folklore series of the institute of anthropology, ethnography, and archeology. For example, two substantial volumes of songs from the relatively small region of the Pinega River basin were published in 1937. Revolutionary songs of czarist times are included in the collection *Russ-*

kaya Narodnaya Pesnya (*Russian Folk Song*), published in Moscow in 1936.

Instruments.—Folk music is deeply rooted in Russian folklore. In *The Tale of the Campaign of Igor* dated about 1200, the legendary figure Bayan, is a musician: "Bayan, as he recited the strife of bygone times, sent out ten falcons after a flight of swans, and the one that was first overtaken began her song. But in truth, brethren, not ten falcons did Bayan loose on the swans, but his wise fingers did he lay on living strings, and they by themselves sang the glory of the princes." The stringed instrument that Bayan played was the ancient *gusli,* a sort of zither or horizontal harp, with ten or more strings and a wooden sound chest. The *gusli* is no longer in practical use. Rimski-Korsakov introduced a part for *gusli* in his opera *Sadko,* to evoke the atmosphere of old Russia, but the part is usually performed on the harp. Other ancient stringed instruments are the *domra* (similar to the guitar, and played with a plectrum), and the *gudok* (a three-stringed instrument with a pear-shaped body, and played with a string bow). The *domras* were revived in Soviet Russia, and are often included in modern orchestral compositions.

In the Ukraine, the *domra* is known under the name *kobza* or *bandura* (from the Polish *pandura*). The popular balalaika is in all probability a development of the *domra.* In the 18th century, the balalaika assumed its familiar triangular shape. It usually has three strings and is plucked like a guitar, without a plectrum. An ensemble of balalaikas, organized by V. Andreyev early in this century, gave many successful concerts in Russia and abroad.

Among Russian wind instruments, the following are typical: the *rog* (diminutive, *rozhok*), a hunting horn; the *dudka,* a vertical flute; the *zhaleika,* a double reed with a single mouthpiece—the two pipes are connected at an angle; and the *svirel,* a panpipe composed of several reeds of different lengths, bound together. The nomenclature of these instruments varies according to locality and period. Finally, there is the Russian bagpipe or *volynka,* probably so named because of its supposed origin in the district of Volynia. It consists of a goatskin bag and two pipes. The *volynka* is referred to in the proverbial phrase, *zatyanut volynku,* "to strike up the bagpipe," meaning to begin a tedious tale.

A most remarkable development of Russian primitive instruments was an orchestra of hunting horns (*rog*), initiated by Simeon Narishkin in 1751. Forty-nine hunting horns of different sizes were manufactured, ranging from three inches to the enormous length of 24 feet. The largest horn produced the note of low A under the bass clef staff. Each member of the ensemble could play only one note, and patient rehearsing was required to perform even a simple polyphonic composition. A German resident of St. Petersburg, Jacob von Stählin (1709–1785), described hearing a successful performance in his interesting memoire, *Nachrichten von der Musik in Russland* (1770); his account was republished, in Russian translation in *Musikalnoye Nasledstvo* (*Musical Heritage,* Moscow 1935).

Ancient Russian percussion instruments were drums, metal bars, and bells. The most interesting instrument is the *buben* (tambourine). A huge *buben,* called *nabat,* was so large that it took four horses to carry it and eight men to operate it.

Skomorokhi.—The first musical entertainers mentioned in Russian history were the *Skomorokhi,* or minstrels, who are spoken of as early as 1068, in Nestor's chronicle. Nestor (1056–1114), Russian monk and chronicler, complained that entertainments by the *Skomorokhi* drew the people away from God; that churches stood empty while the populace amused themselves by playing on the *gusli* and blowing trumpets. According to 13th century sources, the *Skomorokhi* played panpipes (*svirel*), string instruments (*gudok*), and the tambourine (*buben*). In the 15th century, they introduced a new type of entertainment, the puppet theater, which ultimately developed into the popular carnival play *Petrushka.*

The *Skomorokhi* were so popular in medieval Russia that numerous villages in Central Russia were named Skomorokhovo. As this popularity spread, the opposition of church and lay authorities grew stronger. Czar Aleksei (1645–1676) took drastic measures against the *Skomorokhi.* In his decree of 1649, he ordered ruthless persecution of the "godless *Skomorokhi* with their *domras* and *gusli,*" and instructed police to destroy all musical instruments found among their possessions.

Very little is left of the musical compositions sung by the *Skomorokhi;* Nikolai F. Findeisen, in his valuable two-volume work, *Sketches of Music History in Russia from the Most Ancient Times to the End of the Eighteenth Century* (Moscow 1928), cites a few songs and verses preserved in oral tradition.

Church Music.—Parallel to the development of folk music, the church established the foundations of formal musical learning. The pioneers were Greek and Bulgarian clerics who introduced Byzantine chant into Kiev after the Christianization of Russia. As early as the 11th century, texts with musical notation, derived from the Byzantine system of neumes, were in use in the Kiev churches and monasteries. In the 13th century, the Russian system of notation, known as *znamenny* (from *znamya,* sign) or *kryuki* ("hooks," from the angular shape of the notes), emerged as a native version of the Greek system. In 1551, Ivan the Terrible (1530–1584, q.v.) established schools for teaching musical notation for use of church choirs. He had some knowledge of music and wrote several religious chants himself. Later still, the eight modes of the Russian *znamenny* chant were organized according to typical melodic figures, called *popiyevki* (singing patterns). About 1700, the five-line notation, current in Europe, was universally adopted in Russian churches.

The first beginnings of polyphonic choral music date from the early 18th century. In 1713, Peter the Great (1672–1725, q.v.) formed a choir of sixty singers, and Russian noblemen organized private choruses. These so-called *capellas* (from the Italian word *cappella,* meaning chapel or choir) developed into the Russian choirs which became famous for their fine qualities and virtuosity. The *capella* founded by Peter the Great is still flourishing in Leningrad.

The father of Russian religious music in the polyphonic style was Dmitri Bortnyanski (1751–1825), who studied in Italy, where he acquired the technique of part writing. Maxim Berezovski (1745–1777) wrote during his short life (he

committed suicide at the age of 31) many sacred works of high quality. Aleksei Lvov (1799–1870), author of the czarist national anthem, also composed sacred music, and wrote a treatise on the structure of Russian religious songs. Later both Peter Tschaikovsky (Chaikovski) and Alexander Grechaninov, (qq.v.) contributed to Russian music, writing in a free contrapuntal style.

Secular Music.—The initial impetus to secular music was given by the Italian musicians who were invited to Russia in the 18th century by the empresses Anna Ivanovna, Elizabeth Petrovna, and Catherine the Great (qq.v.). They included several world renowned names: Francesco Araja, Vincenzo Manfredini, Giuseppe Sarti, Baldassare Galuppi (q.v.), Tommaso Traetta, Giovanni Paisiello (q.v.), Domenico Cimarosa (q.v.), and others. These Italians were largely responsible for the flourishing state of opera and ballet in St. Petersburg during the second half of the 18th century. They acted as choir masters, teachers, concert players, and composers. The first opera with a Russian text, *Cephalus and Procris,* was composed by Francesco Araja (c.1700–c.1770) on a libretto by Alexander Sumarokov (1718–1777), and produced in St. Petersburg in 1755. Its serious defect is inaccurate conformity with the prosody of the libretto; Araja had poor knowledge of the Russian language.

Under the influence of Italian music, several Russian-born composers wrote operas during the reign of Catherine the Great. Among them were Evstigney Fomin (1761–1800), the author of the opera *Amerikantsy* (in the sense of Indians), depicting a romantic story in Mexico; and Vasili Pashkevich, composer of the opera *Fevey,* of which Catherine the Great wrote the libretto. The *Kalmuck Chorus* from the opera *Fevey* is the earliest example of orientalism in Russian music.

The National School.—By the beginning of the 19th century, Russian music had evolved to a point where it was feasible to establish a national style of composition. The Russian art song, in the folklore manner, was cultivated by Alexander Alyabyev (1787–1851), Nikolai Titov (1800–1875), and Alexander Varlamov (1801–1848). Aleksei Verstovsky (1799–1862) wrote an opera on a Russian subject, (*Askold's Tomb,* 1835), which in spite of its Italianate idiom has some Russian traits.

The acknowledged founder of the Russian national school of composition was Mikhail I. Glinka (1804–1857, q.v.), who is to Russian music what Alexander Pushkin (q.v.) is to Russian literature. Glinka integrated the elements of Russian musical folklore into a musical language that can be called genuinely national. His first opera was produced in 1836, under the title *A Life for the Czar;* he had originally named it *Ivan Sussanin.* The subject was taken from Russian history, and Glinka developed it in a purely national manner, especially in the songs and choral passages. His second opera *Ruslan and Lyudmila* (1842), from Pushkin's poem, is remarkable for its brilliant color. Glinka's symphonic dance, *Kamarinskaya,* was the earliest example of orchestral treatment of Russian dance rhythms. In his songs and ballads, the vocal line of Russian songs received its perfect expression.

The music of Alexander S. Dargomyzhski (1813–1869) differs greatly from Glinka's. Less brilliant in color, it is rich in musical characterization. Dargomyzhski's opera *Russalka* (*The Mermaid,* 1855) retains the traditional division into arias, but is written in a distinctly Russian folklore style. In his posthumous opera *Kamennyi Gost* (*The Stone Guest,* 1868), Dargomyzhski appears as an innovator: he abandons Italian models in favor of operatic realism, and replaces conventional recitative with vocal declamation.

The Mighty Five.—Both Glinka and Dargomyzhski remained little known outside Russia, but with the great symphonic and operatic works of Tschaikovsky, Rimski-Korsakov, and Musorgski Russia became a powerful factor in the general course of music history. The spirit of nationalism in Russian music was accentuated when five Russian composers known as the *Moguchaya Kuchka* (literally, "a mighty heap") formulated a set of musical aims. These composers were Balakirev, Borodin, Cui, Musorgski, and Rimski-Korsakov, and the epithet was bestowed on them by the Russian critic Vladimir Stasov (1824–1906). The individual talents and the contributions to Russian national music by these five composers were far from equal. César A. Cui (1835–1918), a military engineer who wrote several operas in a conventional romantic style, could not be included among the "Mighty Five" except by accident. Mili A. Balakirev (1837–1910) played the role of spiritual head of the group and did much to inspire his companions with the ideals of Russian national art. But he wrote little, and only his Oriental fantasia, *Islamey,* survives the test of time. It is more appropriate, therefore, to speak of the "Mighty Three" of Russian music: Borodin, Rimski-Korsakov, and Musorgski. It is interesting that not one of them was a professional in the narrow sense of the word. Borodin was a professor of chemistry, Rimski-Korsakov was a naval officer, and Musorgski was a government employee.

Of the three, Nikolai Rimski-Korsakov (1844–1908) was the most prolific. In his many operas, he re-created the spirit of Russian folklore and history. Russian legends and folk tales are reflected in *Snegurochka* (*Snow Maiden,* 1882) and *Sadko* (1894); and Russian history in *Tsarskaya Nevesta* (*Czar's Bride,* 1893). He wrote operas to two fairy tales by Pushkin, *Czar Saltan* (1899–1900) and *Zolotoi Petushok* (*Le Coq d'or,* or *The Golden Cockerel,* 1906). Rimski-Korsakov's religious opera *Skazanye o Nevidimom Grade Kitezhe* (*Tale of the Invisible City of Kitezh,* 1907) shows the influence of Wagner's *Parsifal.* In the symphonic field, *Scheherazade* (1881) was epoch-making in its colorful treatment of musical material.

Alexander P. Borodin (1833–1887) was partly an Orientalist. His symphonic sketch *In the Steppes of Central Asia* (1880) utilized elements of Russian orientalism, which appears also in the famous *Polovtzian Dances* from the opera *Prince Igor,* completed posthumously by Rimski-Korsakov and Glazunov. In a purely Russian style, Borodin created an epical work in his Second Symphony (1870), which without an explicit program, paints a panorama of Russian *byliny* (epical chronicles).

Modest Musorgski (Moussorgsky, Mussorgsky, 1839–1881 q.v.) was regarded by contemporaries as an erratic genius with inadequate technical equipment for the tasks he undertook.

In historical perspective, however, he seems the greatest of the "Mighty Five" in boldness of musical invention, and in profound understanding of the essence of Russian national folklore. Many of his harmonic procedures anticipate developments of modern music. Musorgski's greatest work is the opera *Boris Godunov* (1869). It is usually performed in the version prepared by Rimski-Korsakov, in which certain crudities of orchestration and unconventional harmonic progressions are smoothed out. Recently Musorgski's original score was restored, and the opera has been performed as composed, in Russia and abroad. Dmitri Shostakovich also undertook reorchestration of *Boris Godunov* in 1941. Musorgski's opera *Khovanshchina* (on a historic subject) was begun in 1873, and completed by Rimski-Korsakov. In his short opera *Marriage* (1868, after Gogol's play), Musorgski applies the modern treatment of operatic dialogue. His piano suite, *Pictures at an Exhibition* (1874) is remarkable for variety of characterization, from light humor to grandiose tonal painting. The suite has become extremely popular in the orchestration by the French composer, Maurice Ravel.

The cause of nationalism in Russian operatic music was ably served by Alexander Serov (1820–1871), author of *Vrazhya Sila* (*Enemy Power*), produced posthumously in 1871 and still in the Russian theatrical repertoire. Serov's music, however, lacks the revolutionary originality of Musorgski and the effectiveness of Rimski-Korsakov's operatic panoramas. Similarly lacking in force are the numerous operas of Anton Rubinstein (1829–1894), who left a mark on Russian musical culture as the first great Russian pianist and as founder of the St. Petersburg Conservatory (1862). His opera *The Demon* (1875, after Mikhail Y. Lermontov, q.v.) and his effective piano pieces enjoy great popularity. Anton's brother, Nikolai Rubinstein (1835–1881) was also a celebrated pianist and founded the Moscow Conservatory in 1866.

Russian Romanticism.—The unique and solitary figure of Peter Ilich Tschaikovsky, or Chaikovski (1840–1893, q.v.) dominates Russian symphonic music of the second half of the 19th century. Tschaikovsky stood aloof from his musical contemporaries and developed a style intensely individual, subjective, and often morbidly introspective. Although his music is unmistakably Russian, Tschaikovsky rarely resorts to literal quotations of Russian folk songs (as in the finale of the Fourth Symphony). His nationalism lies in his extraordinary power to create a peculiarly Russian mood by expressing his own inner sentiments. From Tchaikovsky's pessimism, his predilection for minor keys, and his choice of titles (*Chanson Triste, Sérénade mélancolique*, etc.) some interpreters of Russian music have concluded that the "Slavic soul" is inexpressibly sad. This conclusion appears unwarranted. Much of Tschaikovsky's own music is joyful, though the programmatic designs of his symphonies are invariably dark and somber. The Fourth and the Fifth symphonies express the inexorability of fate and the futility of struggle. The spirit of the Sixth Symphony (*Pathétique*, 1893) which Tschaikovsky conducted in St. Petersburg a few days before his death from cholera, is one of dejection. The musical quotation from the service for the dead, in the first movement of the *Pathétique* is characteristic of the composer. Tschaikovsky's symphonic poems (*Romeo and Juliet*, 1869; *Francesca da Rimini*, 1876) are romantically somber, but the music itself has great vitality. Tschaikovsky's operas, *Eugene Onegin* (1878) and *La Pique-Dame* (*The Queen of Spades*, 1890), both after Pushkin, are extremely popular in Russia, as are his ballets, *Lac des Cygnes* (*Swan Lake*, 1876), *La Belle au bois dormant* (*The Sleeping Beauty*, 1889), and *Casse-Noisette* (*The Nutcracker*, 1892).

St. Petersburg and Moscow Schools.—Tschaikovsky and the "Mighty Five" greatly influenced the development of Russian music during the late 19th and early 20th centuries. Tschaikovsky's followers cultivated the romantic type of symphonic, operatic, and vocal music. The center for musical nationalists of the modern school was St. Petersburg, where the "Mighty Five" had flourished, while the stronghold of the romantic school was Moscow, where Tschaikovsky had taught at the conservatory.

The heir of the nationalist School of St. Petersburg was Alexander Glazunov (1865–1936); he wrote eight symphonies, violin and piano concertos, and chamber music, but no operas. As director of the St. Petersburg Conservatory (1906–1927), Glazunov played an important role in the education of the new generation of Russian composers. Anatole Liadov, or Lyadov (1855–1914), not a prolific composer, distinguished himself principally by short symphonic poems (*Baba-Yaga, Kikimora*) in the Russian folklore manner. Nikolai Tcherepnin, or Cherepnin (1873–1945) is known chiefly for his songs in Russian style.

The greatest representative of the Moscow school was Sergei Rachmaninov (1873–1943, q.v.); his most enduring works are his piano compositions, which greatly elevated Russian pianistic style. His Piano Concerto in C Minor, No. 2 (1901) is a classic of piano literature. His songs, poetic and lyrical, are in the Tschaikovsky tradition. Rachmaninov spent the last 25 years of his life abroad, chiefly in the United States, and his work of this period is less significant than his earlier music. Anton Arenski (1861–1906, q.v.), wrote effective piano and chamber music in a style resembling Rachmaninov's, and Vasili S. Kalinnikov (1866–1901) is remembered for his romantic First Symphony.

Sergei I. Taneyev (1856–1915), Nikolai Medtner (1880–), Alexander Grechaninov (1864–), Mikhail M. Ippolitov-Ivanov (1859–1935), Reinhold Glière (1875–), and Sergei Vassilenko (1872–) in general follow the Moscow school, with some stylistic departures toward the nationalists. Taneyev was a great master of counterpoint and wrote a monumental treatise on contrapuntal technique. Few of his compositions (a symphony, chamber music, songs) achieved popularity. Medtner wrote almost exclusively for piano, and his style is a modern adaptation of Chopin and Brahms. After the revolution, Medtner left Russia in 1921 and settled in London in 1936. Grechaninov composed several operas, which follow the nationalist school in using subject matter from Russian epical legends. His songs and choral works reflect Russian romanticism. Grechaninov left Russia in 1925 and settled in the United States in 1939, where he continued to compose. Glière combines features of the nationalist school with romantic elements. Vassilenko adheres stylisti-

cally to the Moscow school, with some kinship to the nationalists in his operas.

Vladimir I. Rebikov (1866–1920) merits a place in the history of Russian music. At first a follower of Tschaikovsky, he was later attracted to modernism. He was the first Russian composer to use the whole-tone scale, not as an incidental device, but as a basic thematic structure.

Russian Modern Music.—The first true modernist of Russia was Alexander Scriabin or Scriabine (1872–1915, q.v.). His early piano works were strongly influenced by Chopin and his orchestral music owed much to Wagner. But Scriabin outgrew these influences to develop his own highly individual technique of composition. He moved from the harmonies of Liszt and Wagner to a style of composition in which tonality almost ceases to exist and dissonances supplant concords. As a new harmonic basis Scriabin made use of a six-note chord, which he called the "mystic chord." Religion and philosophy were important in Scriabin's aesthetics, and his major works bear such indicative titles as *Le Divin Poème* (*The Divine Poem,* 1903); *Le Poème de l'Extase* (*The Poem of Ecstasy,* 1907–1908); and *Le Poème du Feu* (*The Poem of Fire,* 1909–1910). In *Poem of Fire* (also known as *Prometheus*), Scriabin included a part for a *clavier à lumières,* an instrument designed to produce sequences of colored lights. This color keyboard proved impractical, however. Shortly before his death, Scriabin made sketches for a pantheistic work called *Mystery,* in which he intended to unite all arts. Scriabin's music stands outside Russian national culture as a purely musical development of modern times, yet his technical innovations and his explorations in the field of new sonorities have deeply influenced the new generation of Russian composers.

The modern period of Russian national music is associated with the name of Igor Stravinski (1882– , q.v.). Stravinski's early works continued the tradition established by Rimski-Korsakov, with whom Stravinski had studied. The use of color in instrumental treatment and the programmatic depiction of Russian fairy tales, characteristic of Rimski-Korsakov's last period, are the mainstays also of Stravinski's early compositions. His *L'Oiseau de Feu* (*The Firebird,* 1910) is a colorful symphonic panorama of Russian folklore. His *Petrushka* (1911) portrays the scenes of the Russian carnival. Both scores were written for Sergei Diaghilev's Ballet Russe in Paris. After their production, Stravinski went abroad; he became a French citizen in 1934, and lived in France until 1939, when he went to the United States. Paradoxically, Stravinski became the acknowledged leader of Western modernism through works which are intensely Russian. His most revolutionary score is *Le Sacre du Printemps* (*The Rites of Spring,* 1913), which is a modernistic representation of the rituals of pagan Russia. In this composition, Stravinski broke away from tradition and introduced polytonal and polyrhythmic innovations of unprecedented boldness. After 1924, Stravinski's style changed toward neoclassicism. His works of this period are based on pseudo-classical formulas (the ballet, *Apollo Musagètes,* 1927; the opera-oratorio, *Oedipus Rex,* to a Latin text, 1928; *Symphonie des Psaumes,* 1930), or are pasticcios of music by other composers (*Le Baiser de la Fée,* [*The Kiss of the Fairy,* 1928], a ballet based on Tschaikovsky's themes).

Several Russian composers living abroad were commissioned to write ballets for Diaghilev's Ballet Russe. The most prominent is Sergei S. Prokofiev (1891–). He returned to Russia in 1933, after an absence of 16 years, and identified himself with Soviet music. Of the younger men, Vladimir Dukelski (1903–), Nikolai Nabokov (1903–) and Igor Markevich (1912–) wrote effective ballets in the neoclassical manner, which were produced by Diaghilev.

Soviet Music.—The period after 1917 provides the musical historian with many contrasts. The political revolution did not signalize developments of extreme leftism in music. Ultramodernists attempted to discard the musical heritage of the past and to inaugurate a new revolutionary type of music, but such attempts were doomed to failure from popular distaste. Adherents of proletarian music were equally unsuccessful in attempting to emphasize mass appeal and revolutionary subject matter. A compromise was effected in the formula of socialist realism, which postulates an art "socialist in content and national in form." Changing trends in Soviet musical aesthetics ran parallel with changes in the political and social structure of the Soviet Union. The development of Soviet music may be subdivided into three phases: (1) the initial period, from 1917 to 1921, marked by the spirit of absolute innovation; (2) the period of conflicting trends, from 1921 to 1932, signalized by the rise and fall of proletarian music; (3) the period of socialist realism in music, after 1932.

The atmosphere of famine and civil war during the early years of the Soviet regime did not encourage creative composition. Yet concert life continued, and the new audiences of soldiers and workers eagerly patronized the opera, ballet, and symphony. Revolutionary ideology had little effect on the repertoire, although there were attempts to inject a social note into familiar operas. Giacomo Puccini's *Tosca* was rewritten as a story of the Paris Commune and Giacomo Meyerbeer's *The Huguenots* was changed to *The Decembrists;* but after a few performances, the old libretti were restored.

The first operas on Soviet subjects were *Za Krasni Petrograd* (*For Red Petrograd,* 1926) by Arseni Gladkovski (1893–) and Vladimir Prussak, and *Ice and Steel* by Vladimir Deshevov (1889–). The libretto of the first treated the Petrograd campaign of 1919, and the second opera was about the Kronstadt rebellion of 1921. Neither was successful. More interesting was *Severny Veter* (*The North Wind,* 1930) by Leo Knipper, an opera on the subject of the civil war and intervention. The first really successful Soviet operatic composer was Ivan Dzerzhinski (1909–). The subject of his first opera was Mikhail Sholokhov's famous novel *Tikhi Don* (*And Quiet Flows the Don*). It was produced in Leningrad on October 22, 1933, and had instantaneous success. His second opera, *Podnyataya Tselina* (*Soil Uprooted*), also after Sholokhov, was staged in Moscow on October 23, 1937, and proved equally successful. Other Soviet operatic composers of significance are Oles Tchishko (1895–), author of the opera *Battleship Potemkin* (1937) and Tikhon Khrennikov (1913–) who wrote the opera *Brothers* (1936) based on an episode from the civil war.

The Ukrainian composer Boris Lyatoshinski (1895–) composed an opera *Shchors,* on the life of a Ukrainian civil war hero of that name.

Though the early years of the revolution saw few radical departures in composition itself, there were many daring innovations in musical science and in performance. In Moscow, a conductorless orchestra, called *Persimfans,* for Pervi Simfonicheski Ansamble (First Symphonic Ensemble), was organized in 1922 as a protest against autocratic conductors. For five years it presented numerous classical and modern works. In 1922, the Soviet engineer Leon Theremin (1896–) demonstrated in Moscow the first electronic instrument, the *thereminovox,* capable of unlimited variation of pitch and tone-color. A later development in electronic instruments was the *emiriton,* or electric piano, built in 1943 by a grandson of Rimski-Korsakov.

With the re-establishment of communications with western Europe, Russian musicians became acquainted with the new music of Germany and France. The Association of Contemporary Music in Leningrad, formed in 1927, was active for several seasons in presenting works by European modernists. Machine music, as exemplified by Arthur Honegger's (1892–) symphonic poem, *Pacific 231,* had its adepts in Russia. Vladimir Deshevov wrote *The Rails,* which imitated the noise of a railroad train in motion; Alexander Mosolov (1900–) composed the industrial ballet *Zavod (Factory),* which for realistic effect included a metal sheet in the orchestration. On the theme of Soviet industrial development, Prokofiev wrote a ballet called *Le Pas d'Acier (The Age of Steel,* 1925), which was produced in Paris by the Ballet Russe.

In opposition to the modernists, a powerful movement arose in favor of a special type of proletarian music. The Russian Association of Proletarian Musicians (RAPM) issued a manifesto in 1924, proclaiming the principles of proletarian music. It opposed all "progressive" trends in modern music, and all types of Western urban art, including jazz, in favor of revolutionary themes, in the tradition of Beethoven's Third Symphony (*Eroica*). After several years of propaganda and controversy, which threatened to end creative activity in Russian music, the RAPM was dissolved by governmental decree on April 23, 1932. This date was a landmark in the evolution of Soviet ideology in music.

Proletarian music was discredited and now Stalin's formula of socialist realism ("socialist in content, national in form") was applied to music, within the framework of national art. A new crisis came in January 1936, when the Moscow newspaper *Pravda* in two articles severely criticized the composer Dmitri Shostakovich, first for "leftist deviation" and "naturalism" in his opera *Lady Macbeth of the District of Mtsensk* (1930–1932), and second for "oversimplification" in treatment of a Soviet theme in the ballet *Svetly Ruchey (The Limpid Stream,* 1934). The articles posed the problem of defining socialist realism and of drawing a clear line of demarcation so as to prevent the fallacy of "naturalism" or "oversimplification." The Shostakovich case became a *cause célèbre* in the annals of Soviet music, because of the stature of the composer and his place in Soviet art.

Dmitri Shostakovich was born in Leningrad in 1906, and grew up almost entirely under Soviet life; his talent developed with the evolution of Soviet ideology in general aesthetics. His early works were satirical in character. His opera, *The Nose* (1927–1928), based on a tale by Nikolai Gogol (q.v.), featured such effects as drunken hiccoughs, imitated by harp and violins, and the sound of a razor on the face. The part of the principal character, the Nose, was to be sung by a performer with his nostrils stuffed with cotton wads. There was an octet of eight janitors singing eight different advertisements. The opera was produced as an experimental spectacle in Leningrad, on January 13, 1930.

The ballets of Shostakovich have the same satirical vein. In *The Golden Age* (1929–1930) there is a discordant polka which satirizes the Geneva disarmament conference. There is similar satiric strain in his symphonies. His First Symphony in F Minor, written at the age of nineteen, has become a standard piece of orchestral repertoire in Russia and abroad. The Second in F Minor, called *October Symphony,* written at 21, and Third, *May First,* were less popular. After the rebuke administered by *Pravda,* Shostakovich abandoned programmatic music and returned to pure symphonic composition. His Fourth Symphony remained in manuscript, but his Fifth, played in November 1937, at the festival celebrating the twentieth anniversary of the Soviet Revolution, received tremendous acclaim and Shostakovich regained his place as a foremost Soviet composer. The Sixth Symphony (1939) was less successful, but the Seventh (1941), written during the siege of Leningrad, became world-famous. This work depicts the struggle of the Soviet citizen against the invader, and its triumphant finale foretells the inevitable victory. In 1943 Shostakovich wrote his Eighth Symphony, and in 1945 the Ninth Symphony. The Soviet government twice awarded Shostakovich the Stalin Prize of 100,000 rubles, first for his Piano Quintet (1940) and again for the Seventh Symphony.

In recent years the national element has grown very strong in the works of Soviet composers. Prokofiev, since his return to Russia in 1933, has written many compositions in this vein. Among them are the cantata *Alexander Nevsky* (based on the score of a film of the same name, which glorifies the repulse of the Teutonic Knights by the Russian Prince Alexander in the year 1242) and the opera *War and Peace* (after Tolstoy's novel, 1941–1942), completed during the Second World War. He wrote a symphonic suite entitled *1941,* and the *Ballad of an Unknown Boy* (1943), a cantata about a young guerrilla fighter who died for his country. Yuri Shaporin (1890–) has written two patriotic cantatas: *Na Pole Kulikovom (On the Kulikov Field),* commemorating the Russian victory over the Tatars in the 14th century, and *Skazanye o Bitve za Russkuyu Zemlyu (Chronicle of a Battle for Russian Land),* composed in 1944, on the subject of the war against the Nazis.

Older Soviet composers have successfully adapted themselves to the new themes. The most important of them are Reinhold Glière (1875–), Sergei Vassilenko (1872–), Maximilian Steinberg (1883–), and Mikhail Gnessin (1883–). Glière excels in monumental symphonic and operatic subjects; Vassilenko writes romantic music; Steinberg, a disciple and son-in-law of Rimski-Korsakov, continues the tradition of the

Russian national school; Gnessin writes music based on Hebraic motives.

Nikolai Myaskovski (1881–), the greatest symphonist of modern Russia, occupies a unique position. He has composed 24 symphonies, most of them during the Soviet period. Despite his predilection for somber and individualistic moods, Myaskovski's symphonies are highly regarded by Soviet musicians, and he is the acknowledged dean of Soviet composers.

Aram Khachaturian (1903–), an Armenian composer, wrote symphonies, concertos, and chamber music, notable for sincerity of emotional expression. His wife, Nina Makarova (1908–), became known as one of the most talented women composers in the Soviet Union. Other important names in Soviet music are Boris Asafyev (1884–1949), author of numerous operas and ballets, who wrote music criticism under the name Igor Glebov; Leo Knipper (1898–), author of nine symphonies; Alexander Krein (1883–1951), composer of effective stage music; his brother Gregory Krein (1880–), and Gregory's son, Julian Krein (1913–), who wrote instrumental music in a romantic vein; Vissarion Shebalin (1902–), an able symphonist; Alexander Veprik (1899–), who wrote music inspired by Jewish folklore; Dmitri Kabalevski (1904–), composer of several operas, symphonies, and concertos; Mikhail Starokadomski (1901–), who wrote in a neoclassical manner; Valeri Zhelobinski (1912–), who wrote effective piano music; and Vano Muradelli (1908–), Caucasian-born composer who attracted attention by his strongly individual symphonic writing.

Popular music is encouraged in the Soviet Union. Modern folk ballads, marches, and even the syncopated music classified as "Soviet jazz," are widely sung and played. The most successful composer of light music in the period immediately succeeding the Second World War was Isaak Dunayevski (1900–), who received a Stalin Prize in recognition of his achievement. Soviet "mass songs" have a strong flavor of Russian folk music. Some of them have in fact become folk songs, for example: *Polyushko Pole* (*Meadowland*) by Knipper; *Katyusha* (*Katherine*) by Blanter; and *Provozhanye* (*Farewell*) by Zakharov. A marching song by the band leader A. V. Alexandrov, *Gimn Partii Bolshevikov* (*Hymn of the Bolshevik Party*), was proclaimed by government decree (March 15, 1944) the national anthem of the Soviet Union, in place of the *Internationale.* New words for it were written, stressing the national and patriotic character of the country's credo.

Bibliography.—No comprehensive history of Russian music exists in the English language. *A History of Russian Music* by M. Montague-Nathan (London; New York 1914) is sketchy. Gerald Abraham's book *On Russian Music* (New York 1939) is limited to the discussion of 19th century Russian composers. His book *Eight Soviet Composers* (London; New York; Toronto, 1943), deserves mention. Further, there are biographies, in English, of individual Russian composers, notably Tschaikovsky, Musorgski, Rubinstein, Scriabin, Rachmaninov, and Shostakovich. Rimski-Korsakov's book of memoirs, *My Musical Life,* is available in English. Some information on later composers is found in Sabaneyev's book *Modern Russian Composers* (New York 1927). There are scattered magazine articles on various aspects of Russian music, and accounts of Russian church music and notation are available in recent editions of music dictionaries. Literature on Russian music in the French and German languages is very scant, and the available publications in those languages are mostly out of date. In Russian, the basic work on the history of music is *Otcherki po Istorii Muzyki v Rossii* (*Studies in the History of Russian Music*) by Nikolai F. Findeisen, published in two volumes (Moscow 1929). It gives exhaustive information on old Russian music, ancient instruments, church music, and notation, up to 1800. Nineteenth-century Russian music, the period of the great Russian composers from Glinka to Tschaikovsky, has been covered with great completeness in recent publications. Detailed biographies and musical analyses of the works of Tschaikovsky, Musorgski, Borodin, Rimski-Korsakov, and others have been published, and their correspondence, notebooks, and minutiae of life, have been brought to light in numerous authoritative editions by Soviet musicologists. No history of the Soviet period of Russian music has as yet been attempted, but there are concise dictionaries of Soviet composers, and ample information is found in music periodicals, notably *Sovietskaya Muzyka* (Moscow). Thousands of orchestral scores, operas, chamber music works, piano compositions, and songs by Soviet composers have been published by the State Music Press; they provide rich material for the student of Soviet music. Special publications deal with the progress of music in republics of the Caucasus, Central Asia, and Siberia. G. Orlov's compilation, *Muzikalnaya Literature* (Leningrad 1935) contains a detailed bibliography of Russian music up to 1935. See also Slonimsky, N., "Soviet Music and Musicians" in the *Slavonic Review,* December 1944.

Nicolas Slonimsky,
Author of "Music Since 1900"; Composer and Conductor.

5. ART. Old Russian Art.—A few ancient Russian monuments date from the pre-Christian period, but the information about them is scant and their artistic value is too slight to discuss, outside the field of archaeology. The history of Russian art, therefore, begins with the introduction of Christianity in the 10th century. The Christianization of Russia took a century, just as the process of westernization covered a later century. Byzantine art (q.v.), like the art of western Europe, later, was only gradually accepted and assimilated, and it was modified by various influences, including the historically varying national determinant. It is the latter quality that gives unity and continuity to ten centuries of Russian art.

With Christianity came Byzantine literature, art, philosophy, and social institutions. Kiev soon became one of the most prosperous states in Europe and a leading cultural center. With the missionaries and preachers from Byzantium came Greek artists, who produced numerous mosaics, frescoes, and icons for Kiev, Vladimir, and Novgorod, and who taught their skills to the Russians. The Russians were apt pupils, but almost from the first they added touches of their own to the lessons learned. Ancient Russia carried on a lively intercourse with many other states and regions besides Byzantium; and while the Byzantine heritage in art remained para-

mount until the 18th century, it was modified at various times by the art of the Caucasus, Italy, Persia, India, and western Europe, and by the folk art of Russia itself. The ancient empire began falling apart even before the Mongol invasion early in the 13th century, and many separate cities, including Vladimir, Tver, and Pskov had developed clearly marked styles. The most important style centers, however, were Kiev (11th–13th centuries), Novgorod (14th–15th centuries) and Moscow (16th–17th centuries).

The early Kiev period lasted from the baptism of the Emperor Vladimir I (956?–1015, q.v.) to the Mongol invasion; it left mosaics, a few striking frescoes, and icons in the Cathedral of St. Sophia in Kiev, the Cathedral of Chernigov, the Church of Nereditsa of Novgorod and the Dmitriev Cathedral of Vladimir. Most monuments from this period were destroyed by the Germans in their Second World War invasion. Artistic work of the Kiev period very closely resembled its Byzantine prototypes. Most of it was, in fact, produced by Byzantine masters. The compositions contain few figures simply drawn, and convey an air of solemnity. Favorite subjects were Jesus, the Virgin, the church fathers, the apostles and, by way of rare exception, chariot races and other games at the hippodrome of Constantinople, pictured in St. Sophia at Kiev. Figures are conventionalized, as in all Byzantine art, but some have a strong illusionistic quality. The colors are subdued, almost monochrome. When the Mongol invasion in the 13th century isolated Kiev from Byzantium and destroyed many of its monuments, the artistic hegemony passed to Novgorod, the only center not engulfed by the invasion.

Between the fall of Kiev and the rise of Moscow, Novgorod was the most important community in old Russia. Its artists continued to work in the Byzantine tradition which received an added impetus from the second renaissance of Constantinople. Their greatest achievement, however, lay in the building on the Byzantine foundation of a national art as expressed in the frequent use of national saints, in folk ornamentation, in bits of national genre, and architecture, in greatly enriched colorfulness with the generous employment of red, yellow and green so characteristic of Russian folk art, and by functional innovations connected with the iconostas, a partition between the church altar and the worshippers. The iconostas grew in size, in the course of several centuries, from a low screen to an enormously high wall covered with row upon row of icons. These were arranged in strict order and represented local saints, the Trinity, the apostles, the prophets, and others; since the iconostas were viewed upward and from a distance, both colors and composition had to be varied. The outline was emphasized, the design was made broad and simple, figures were elongated; colors were flat.

Ancient Russian art reached its apogee in the 14th and 15th centuries. Politically these centuries saw the struggle against the Tatar yoke and Teuton aggression, and the beginnings of a unified greater Russia under Moscow. Andrei Rublev (c.1370–1430) is the greatest name of the period. One of his very few remaining authentic icons is the *Old Testament Trinity* (early 15th century). It is the most famous single work of art between the 10th and 18th centuries, vying perhaps only with the icon, *Our Lady of Vladimir,* which is said to have been brought from Constantinople to Kiev in the 11th century. The *Trinity* is an outstanding example of compositional subtlety, rhythm, and brilliant harmony of complementary and contrasting colors.

The next great name is Dionysios (early 16th century), who is known especially for his frescoes at Ferapont monastery. His figures are elongated, their gestures mannered; the tonality is a mixture of colors and tints. He was the forerunner of a trend.

With the consolidation of Moscow under Ivan III and Ivan IV and the conquest of Novgorod, Moscow became the center for all schools and styles. In this interpenetration of schools, each lost its identity. Rublev and Dionysios are as much of Novgorod as of Moscow. The trends started by Dionysios grew. The former anonymity of the iconographer began to disappear, and individual names became prominent. Painting became more complex; narrative elements and scenes from daily life found their way into pictures. Even didactic semipolitical ideas made their appearance, as in *Church Militant,* an allegory of Ivan IV's triumphant return to Moscow from the conquest of Kazan. Attention to detail grew at the expense of the picture as a whole. The trend found the clearest expression in the Stroganov school, named after a fabulously wealthy family of merchant princes, colonizers, and art patrons.

Unlike the earlier icons, the painting of the Stroganov masters is no longer a *Biblia pauperum* (Bible of the poor). It lacks the folk quality of Rublev. It is an art which expresses the taste of its wealthy patrons, an art of endless refinements. Although the artists try to stay within the Byzantine tradition, influences from Iran and India are evident. The tiny pictures have an enamel-like surface glittering with delicate tints and silver, which go well with the jewel-encrusted gold frames.

The middle of the 17th century witnessed a great expansion of international trade, the introduction of foreign methods in manufacture, and the importation of foreign artists. In a special section of the czar's state armory about 60 foreign artists were employed—Dutch, German, Polish, and others, including an Arab and a Persian. Their task was to design coins and emblems, to make architectural drawings, to decorate palaces, and to paint *parsunas* (persons, i.e., portraits). They taught their trade to Russian artists and their far-reaching influence led to violent conflicts which were resolved in favor of *friaz* (western European methods).

Simon Ushakov (1626–1686) was the leading master of *friaz* painting. Varying a famous phrase by Shakespeare, Ushakov wrote that art must emulate the unique quality of the mirror to reflect nature faithfully. In his own practice, however, he did not go quite so far. His paintings combined abstract Byzantine conventions with western European realism of detail. Correctly drawn and correctly lighted parts of a picture are often combined in a manner utterly unrealistic. Ushakov's followers carried this tendency to fantastic lengths: buildings have no beginning or end; figures are related to each other by subject but lack a correct spatial relation to background. Detail crowds upon detail in a combination of great virtuosity. The colors have neither the monochrome quality of Kiev nor the brightness and purity of Novgorod; they are rather a blending

of intermediate tints and shades. The *Annunciation,* which Ushakov painted jointly with Yakov Kondratiev and Gavrila Kazanets, typifies an entire trend of the time as well as these individual artists.

Under Peter the Great (1672–1725, q.v.) secular art rose to pre-eminence, but Byzantine painting did not disappear. It continued in a subordinate role throughout the 18th and 19th centuries. In the villages of Palekh, Mstera and Kholui, where iconography had been practiced for centuries, the ancient technique continued up to the postrevolutionary period, when it was used with success in the portrayal of Soviet themes.

Art in the 18th Century.—Peter the Great completed with one drastic blow the disintegrating process in art and society that had begun half a century earlier. He continued to use the artists of the state armory; one of these was A. F. Zubov, a follower of Ushakov, who was the first to record the rise of the city of St. Petersburg in numerous views. Peter imported more artists from other countries and began to send Russian artists abroad to study. During Peter's reign and for years afterward, portraits retained the flatness and rigidity of the 17th century *parsunas,* even when painted by artists like I. Adolski, I. P. Argunov (1727–1802), I. Y. Vyshnyakov (1699–1762), and A. P. Antropov (1716–1795). All these had received European training but divided their time and allegiance between the new secular subjects and the old iconography.

Peter, Elizabeth (1709–1762), and Catherine the Great (1729–1796), qq.v., wanted to create in St. Petersburg a rival of other great European capitals. They built in rapid succession palaces, churches, forts, mansions, monasteries, where painters and sculptors were employed, under the supervision of the architects, to decorate walls, panels, and ceilings with allegories drawn from classical antiquity. For a time portraiture was relatively neglected, but it soon regained a status equal in importance with decoration. Where decoration was intended to surround court and nobility with pomp and splendor, portraiture emphasized the importance of the active commanding individual. The first stilted efforts of Vyshnyakov and Argunov were succeeded by the accomplished classical portraiture of F. S. Rokotov (c.1730–1810), Dmitri G. Levitski (1735–1822) and V. L. Borovikovski (1757–1825).

The great period of Russian classicism received its most powerful inspiration from French revolutionary classicism as exemplified by Jacques L. David (1748–1825, q.v.). The revolutionary perturbations that shook Europe were accompanied by peasant uprisings in Russia, which threw the monarchy and court into extreme terror. Yet some among the nobility and the intellectuals saw in those very events the need for popular reform. The Academy of Arts (organized in 1758 and officially established in 1764) was the creation of the court and a pillar of conservatism. Yet it was the carrier of the progessive classical ideal. A. P. Losenko (1737–1773), G. I. Ugryumov (1764–1823), and V. K. Shebuyev (1777–1855) chose themes from both classical antiquity and ancient Russia, which they interpreted to convey the ideas of civic duty, self-restraint, and sacrifice for the good of the nation. Popular heroes like Minin and Pozharski became favorite subjects. The most radical among all the artists was undoubtedly I. Yermenev. His peasants are drawn with a downright honesty and a vigor unique for the period, and Yermenev himself participated fittingly enough in storming the French Bastille. In portraiture the trend toward realism was particularly developed in paintings of untitled persons, as in Levitski's *Diderot* (in contrast to the idealized image of Catherine) and Borovikovski's *Madame de Staël.* This tendency was equally powerful in sculpture, in works by M. I. Kozlovski (1753–1802) and I. P. Prokofyev (1758–1828), and especially in the splendid portraits by F. I. Shubin (1740–1805) (*Lomonosov*) and the statuary of I. P. Martos (1752–1835) (*Minin and Pozharski*).

Art in the 19th Century.—In the first quarter of the 19th century, with reaction in the saddle both at home and abroad, classicism degenerated into mere formalism. The enormous pictures of K. P. Brulov (1799–1852) (*The Last Days of Pompeii*) and F. A. Bruni (1799–1875) (*The Brass Serpent*) adhered with great competence to all the academic canons of classical composition, but were cold and rhetorical in content. Hope of progress now lay in the field of realism. Alexander Ivanov (1806–1858), a forlorn figure, wandered between classicism and realism, between piety and enlightenment, and achieved an incompleted masterpiece in *Christ Appears to the People.*

In the meantime I. M. Tankov's 18th century Italianate Russian peasants began to put on a more authentic Russian dress in A. G. Venetsianov (1780–1847) (*Reapers*) and V. A. Tropinin (1776–1857) (*Lace Makers*). It was Venetsianov who enunciated the admirable principle that an artist must paint not "à la Rembrandt" or "à la Rubens" but "à la nature." Though he did not quite live up to his own principle, some who followed him did. P. A. Fedotov (1815–1852), the satirist of middle-class society and impoverished nobility, was the link between Venetsianov and the next important school, called The Travellers, which was aggressively Russian, vigorously realistic, and frankly propagandistic.

The Travellers: V. V. Pukirev (1832–1890), V. G. Perov (1833–1882), V. E. Makovski (1846–1920), V. M. Vasnetzov (1848–1927), Ilya Repin (1844–1930), Vasili V. Vereshchagin (1842–1904), G. G. Myasoyedov (1835–1911), K. A. Savitzki (1845–1905) strove for "contents worthy of a thinking mind." In content, their work dealt with every social injustice they observed in the surrounding world. They flayed religious superstition, marriage for money, the butchery of war; they pictured downtrodden suffering peasants, gluttonous priests, penurious students, corrupt *chinovniks* (bureaucrats), starving artists. They brought realism into historic painting (V. G. Shvartz, 1838–1869; Vasili I. Surikov, 1848–1916), into religious painting (N. N. Ge, 1831–1894; I. N. Kramskoi, 1837–1887), into landscape (I. I. Shishkin, 1831–1898; A. K. Savrasov, 1830–1898; I. I. Levitan, 1860–1900). Sculpture lost the pre-eminence it had held in the 18th century. Academic classicists like F. P. Tolstoy (1783–1873) and G. R. Zaleman (1859–1911), romanticists like Boris I. Orlovski (1787–1839), naturalists and psychological realists like N. S. Pimenov (1812–1864), Mark M. Antokolski (1843–1902), V. A. Beklemishev (1861–1920), impressionists like P. P. Trubetskoi (1867–1938), and A. S. Golubkina (1864–1927), archaists like S. T. Konnenkov (1874–) and D. S. Stelletzki

(1875–) typify and summarize every school of the 19th century.

The political and social movements of the 1860's and 1870's were followed by the reaction and hopelessness of the 1880's and 1890's. The young labor movement born of the country's industrial expansion found but a pale echo in art (N. A. Kasatkin, 1859–1930; A. Y. Arkhipov, 1862–1930). The Travellers were rebels of an earlier day, but in clinging to a peasant orientation they were now outdated, both for those who demanded a bolder social approach to art and for those who wanted no social message in art at all. The latter were in the majority. It was a period of mysticism, retrospectivism, individualism in every form. The social theme was in decline. In the ascendant were Levitan's landscapes of mood, M. V. Nesterov's (1862–1942) and Vasnetzov's revivals of religious and nationalist motifs, M. A. Vrubel's (1856–1910) imaginative symbolism, A. V. Riabushkin's (1861–1904) idealizations of Moscow's past, V. E. Borisov-Musatov's (1870–1905) elegiac nostalgia for the cherry orchards of his childhood.

All these soul searchings were brought into focus at the turn of the century by the World of Art, a group of artists who issued a publication of the same name. They were outspoken individualists, disillusioned with the people and with social idealism. They sneered at the sermonizing of The Travellers; they held that a preoccupation with moral, social or other problems serves only to debase art, and that aesthetic pleasure is the beginning and end of creative activity. In preference to The Travellers' tragic themes done in gray and somber colors, they painted gay and frivolous themes in bright colors. They painted exotic subjects from the colorful East, from ancient Russia, from mythology, and fairy tales, and themes from the high life of 18th century France and Russia. They liked to picture with soft irony the perfumed robes and refined manners of the aristocratic idlers who passed their days gaily in rococo palaces or pursued amatory adventures in shady bowers, near spouting fountains. They excelled in theatrical decoration, especially in sets in which color is dominant, creating the mood of the play. The leading figures in this group were Vrubel, A. N. Benois (1870–), K. A. Korovin (1861–1939), A. Y. Golovin (1853–1930), L. S. Bakst (1866–1924), C. A. Somov (1869–), Nicholas K. Roerikh (1874–), V. A. Serov (1865–1911), Y. Y. Lancerai (1875–), M. V. Dobuzhinski (1875–); and later, S. Y. Sudeykin (1884–), B. D. Grigoryev (1886–1939), A. V. Yakovlev (1887–1938), B. M. Kustodyev (1878–1917), K. S. Petrov-Vodkin (1878–).

The artists P. P. Konchalovski (1876–), A. V. Letulov (1882–), V. V. Rozhdestvenski (1884–), I. I. Mashkov (1881–), and R.R. Falk (1886–) organized a group called The Jack of Diamonds (1909–1910) and translated the art of Cézanne into a more colorful Russian version. The futurists, led by David D. Burlyuk (1882–), gave an initial "slap in the face of public opinion," but their full development did not come until the October Revolution.

Art Since 1917.—During the revolution the Soviet government was busy fighting famine, intervention, and counterrevolution; the field of art awaited a resolute group to assume control and guidance. Which group or tendency could aspire to the role? The World of Art was patently antidemocratic and was tainted by the association with such enemies of the revolution as Hippius, Filosofov, Rozanov. Furthermore, two members of the group, C. A. Somov (1869–) and A. N. Benois (1870–), during the most critical years of the revolution issued their two graphic series *Le Livre de la Marquise* and *Versailles*. Anything more foreign to the spirit of the revolution would be hard to imagine. The Travellers had lost all their former fire of revolt. The futurists stepped into the breach and with the consent of the government took immediate direction of the art institutions and art policies of the country.

At first they went about their task with will and intelligence. It was obviously a period of change and transformation. The old was to be thoroughly uprooted and the new installed in its place. The futurists set out to bring all this about. They abolished the hated Imperial Academy, founded the Free Workshops in its place and reformed the entire art education of the country. They helped to reorganize the old museums and to open many new ones. They helped in transferring private art collections to the state and opening them to the public. They issued new publications, arranged lectures, and established art-study circles and clubs in the army, navy and factories. They helped organize artists into a union, planned competitions for monuments to revolutionary heroes, established state commissions to purchase the work of artists. They staged revolutionary artistic festivals on a gigantic scale. They even performed one service that would appear alien to their profession. Several of the group, led by Vladimir V. Mayakovski (1894–1930), V. V. Lebedev (1891–) and A. M. Lavinski (1893–), despite their abstractionist theory turned out many hundreds of propaganda pictures for the Russian telegraph agency (*Rosta*). Simple, crude, but often strikingly effective, these pictures proved enormously helpful to the government in agitating against foreign intervention and domestic sabotage, in building discipline in the army and in accomplishing industrial rehabilitation.

The futurists did not present a solid front. Among them were expressionists like V. Kandinski (1866–1944), P. N. Filonov (1883–), D. D. Burlyuk, and Marc Chagall (1887–); cubists like A. A. Morgunov (1884–), N. A. Udaltzova (1886–), L. S. Popova (1889–), and A. Pevsner (1886–); and suprematists like K. S. Malevich (1878–1935), A. M. Rodchenko (1891–), E. Lissitzki (1891–); and representatives of other trends akin to the modernism of western Europe. An active core, however, rechristened itself into comfuturism (communism-futurism) to denote their revolutionary orientation. These comfurturists saw in the collapse of the old social system the collapse also of the art which it had engendered, namely, realism in every form, whether literal or distorted. They sought a closer equivalent of the creative forces of the revolution. They found this in Lenin's constant demand for the development of industry and the training of specialists to run it. They called the new art constructivism. "Constructions" were neither paintings nor sculpture but both. They were made of materials which form the daily environment of workers in industry, and which are the true product of modern science: steel, concrete, glass, paper, coal. The

constructionists hoped to combine those materials in such a scientific manner that the worker's collective effort would be reflected in them, that the "constructions" would transmit to the spectator the constructive spirit of the age and make him thereby a convert to it.

Two examples of "construction" will be described: N. A. Altman's (1889–) *Russia* is a rectangular board near the lower narrow base of which the Russian *trud* (labor) is skilfully inlaid in such a way that the letter R, standing for both Russia and revolution, rises diagonally to the top. The spaces between the unevenly sized letters are filled by abstract patterns of metal, coal, ebony, and paper finished in a variety of surface textures. This piece of meticulous craftsmanship was supposed to symbolize the powerful reality of the revolution and its glorification of labor.

V. A. Tatlin's (1885–) monument to the Third International was to be built in the form of a huge, iron spiral (*Symbol of Liberated Humanity*) 400 meters high, and leaning at an angle of 45°. Within this leaning tower of Moscow were stories to be encased in the form of a cylinder on top of a pyramid on top of a cube. These were to revolve, each on its axis at the velocity respectively of a day, a month, a year. This monument was designed to meet the formal demands of aesthetics and the concrete demands of utility. There were many other projects and constructions of similar design.

The futurists were uncompromising in their theoretical attacks on the older forms of art. One of their number, Arvatov, believed that easel painting was a product of capitalist market relations and said, "The problem of the Revolution in art is the problem of liquidating easel painting." Their exuberance, however, was restrained by government authority. Gradually, they and other modernist movements began to lose ground. The country was slowly settling down to a stable existence. The masses returned to normal occupations; youth sought education, soldiers returned from the front. People who sought in art a clear picture of the seething events, who wanted encouragement and guidance, found little in the futurist work to satisfy them. And these people, represented by their various organizations, clubs, and unions, were now the consumers of art. At the same time, the academicians, orientalists, impressionists, began to air their views publicly and loudly. They had never stopped working and exhibiting, though they had remained in the background while the futurists were busy with their reforms. They now came forward more boldly, and new organizations began to spring up, each with a special declaration of principles.

The most important organization in number of members, the ambition of its plans, and the public acclaim it received, was AKHRR (Association of Artists of Revolutionary Russia). It was formed during a discussion meeting at the 47th annual exhibition of The Travellers. The young organization thus paid a tribute to the old but carried forward its heritage with this important difference: The Travellers had always taken a negative stand toward the society in which they were born; the stand of the AKHRR was one of affirmation. The declaration of principles proclaims:

"Our civic duty to mankind is to fix in artistic and documentary fashion the greatest moments of history in all their revolutionary upsurge.

"We shall depict our own day: the life of the Red Army, the life of the workers, the peasants, the revolutionaries, the heroes of labor.

"We consider content the sign of genuineness in a work of art."

To illustrate these principles a series of large exhibitions was circulated throughout the Soviet Union under such titles as "Life and Labor of the Red Army," and "Life and Customs of the Minor Nationalities." The membership of AKHRR, notably A. D. Drevin (1889–), Konchalovski, Kustodyev, K. F. Yuon (1875–), Kasatkin, I. I. Brodski (1884–1939), included many schools ranging from cubism to naturalism. As the organization grew, its program broadened to include landscapes and still lifes as subject matter, along with "Life and Labor." The painting that caused perhaps the most heated debate in a decade was Brodski's *Second Congress of the Comintern* (1924). In an attempt at collective portraiture, the presidium, committees, orators on the platform, Lenin, Stalin, Molotov, and international delegates from all corners of the earth, about three hundred individual persons in all (including the artist in one corner, painting the picture), were portrayed with the most scrupulous fidelity. The painting was widely exhibited and reproduced, and was attacked and defended with equal vehemence.

Other artists' societies existed alongside AKHRR. The most notable were the Four Arts, a group of famous mature artists: Petrov-Vodkin, P. V. Kuznetsov (1878–), M. S. Saryan (1880–), A. V. Shevchenko (1886–), V. A. Favorski (1886–), and The Society of Easel Painters including some of the most gifted young artists trained after the revolution: A. A. Deyneka (1899–), A. A. Labas (1900–), Y. I. Pimenov (1903–), P. V. Williams (1902–), A. G. Tyshler (1898–), D. P. Shterenberg (1881–).

During the decade of AKHRR's existence, when one artists' circle after another declared its allegiance and offered its co-operation to the Soviet government, a small militant group, more political than aesthetic, the RAPKH (Russian Association of Proletarian Artists) raised a clamor under the slogan "Ally versus Enemy" —"Enemy" including by implication some of the best Russian artists. As earlier in the case of comfuturism, the authorities quickly stopped the deliberate creation of a cleavage among Soviet artists. After the famous decision of 1932, all Soviet artists regardless of aesthetic persuasion were organized into one Federation of Soviet Artists.

After that the range of themes grew wider. Artists cultivated whatever genre seemed most suited to their particular aptitude. The younger artists more readily turned to social themes, while others preferred landscape or portrait. Soviet art had come to embrace not only the heroic Soviet theme of "Labor and Defense," but also Soviet fields and forests and the products of Soviet soil. Government recognition and rewards, including prizes and titles, were extended equally to Nesterov, famous as a painter of religious subjects; to Saryan, a Fauve; to Konchalovski and Tyshler; the Kukryniksi, from the names: M. N. *Ku*priyanov (1903–), P. N. *Kry*lov (1902–), *Nik*olai A. *So*kolov (1903–), a trio of satirists; and even to the Palekh artists,

direct spiritual descendants of the ancient Russian iconographers.

Soviet art was fast becoming multinational; the Uzbeks, Turkomen, Ukrainians, Bashkir, and others made substantial contributions to the body of Soviet art. Amateur art grew phenominally in factory, farm, army and navy. Sculpture followed parallel paths, though on a greatly reduced scale. Among the well-known sculptors were I. M. Chaikov (1888–), M. N. Manizer (1891–), S. D. Merkurov (1881–) (statues of Lenin and Stalin), Domogatski, N. A. Andreyev (1873–1932) (portraits of Lenin), V. A. Andreyev (1890–) (statue at top of Soviet Pavilion, World's Fair, New York), P. V. Sabsai (1893–), I. S. Yefimov (1878–) (animals), A. T. Matveyev (1878–), G. I. Motovilov (1892–), I. G. Frikh-Khar (1893–), B. D. Korolev (1885–), S. Tavasyev (1894–), and the women sculptors N. V. Krandiyevskaya (1892–), V. I. Mukhina (1891–1953), (*Soviet Youth* at Paris International Exposition), and S. D. Lebedeva (1906–). The list omits many names but suggests the most characteristic trends. The artist's economic security has been guaranteed by the constitution, and his audience was counted in millions.

Such was the state of Soviet art on the eve of the Second World War. The respect in which art was held and the artist's complete integration with the life and culture of the country, inevitably led artists to throw their efforts wholeheartedly into their nation's gigantic struggle for its very existence. The first war posters began to appear on the day after hostilities opened, and they continued in a never ending stream throughout the war; many artists went to the front as correspondents. Most artists, however, were not thus directly involved in the war, and they continued to work as formerly, though the war theme touched most of them. As the war continued many artists turned for subject matter to great historic events in Russia's past.

A brief mention of characteristic pictures and exhibitions will illustrate the state of Soviet art during the war. About a year after the war began, an all national exhibition was held under the title "The Great Patriotic War." Typical exhibits were: *Driven into Slavery* by G. G. Ryazhski (1895–), *The Peoples' Avengers* by G. K. Savitski (1887–), *Blood Donors* by Konchalovski, *Artillery Attack* by Deyneka. Some historic themes were: *Alexander Nevsky* by Lancerai, *Stepan Razin* by V. S. Svarog (1883–), and *Ivan the Terrible* by P. P. Sokolov-Skalya (1899–). Many landscapes and sketches from the front were also shown. An exhibition held on the twenty-fifth anniversary of the Red Army was called "Red Army in the Fight Against the Fascist Aggressor." Very dramatic was the work done by Leningrad artists during the blockade of 1941–1942. Though every one, including the artists themselves, was half-starved and half-frozen, the artists bolstered public morale by posters, streamers, postal cards, wall decorations, easel pictures, drawings, and sculpture which showed how the city was fighting the enemy, defending its children, preserving its cultural treasures.

On the twenty-fifth anniversary of the October Revolution, A. M. Gerasimov (1889–) was awarded the Stalin Prize for his painting *The Hymn to October,* which is significantly both like and unlike Brodski's *The Second Congress of the Comintern,* painted two decades earlier. *The Hymn to October* represents the plenary session of the Supreme Soviet held at the Bolshoy Theater to celebrate twenty-five years of Soviet power. Stalin, the commissar of defense, is speaking, and in the presidium along with Molotov and Kaganovich are the marshals of the Soviet Union in full regalia. The many nationalities of the sixteen republics are in the hall. In the loges can be recognized Moskvin, Mikhoels, Shostakovich, Mukhina, Grabar, and about two hundred other representatives of Soviet art and science.

Almost every nationality held its own wartime exhibition dipicting its part in the war. The Tadzhik Republic, on the very border of India, held an exhibition, "The Tadzhik People in the Patriotic War." Some of the titles were: *Evacuated Children in Tadzhikistan, Presents for the Red Army,* and *Muhamed Ibrahim, Hero of the Soviet Union, Son of the Tadzik People.* There were also various special exhibitions. "In the Rear of the Enemy" showed work done by partisans behind enemy lines. "Exhibition in a Forest" showed pictures by Red Army men; the works were both created and exhibited near the fighting lines. Many exhibitions had no direct reference to war; said *Literature and Art,* March 1943: "Excellent . . . painters of landscape and genre, in their eagerness to serve the country turn to themes of war . . . this is a wrong conception of art's social significance . . . It is not necessary to violate the nature of one's own gifts." "Veterans of Russian Art" gave full-sided retrospective showing of some of the oldest living artists: V. K. Byalynitski-Birulya (1872–), I. E. Grabar (1871–), B. N. Baksheyev (1862–), I. N. Pavlov (1872–), Lancerai, and Yuon. The exhibition was warmly received and all the artists were awarded the Order of the Red Banner.

As defeat of the hated enemy drew near, Russian artists were planning for the peace. For example, the Soviet press reported that immediately after the liberation of Kiev, Ukrainian artists and art students returned from temporary quarters in Tashkent, Alma-Ata, Ufa, and Samarkand. They held a four-day conference with the participation of artists from Armenia and the RSFSR. Reports described the extent of the destruction of cultural monuments and plans were made for their restoration wherever possible. Among activities planned for the future were: the revival of Ukrainian folk art, the commemoration in painting and sculpture of heroic Ukrainian struggles against the Germans and the reorganization of art schools and museums. According to the official Communist viewpoint, art also is a political weapon influencing the minds of people. Capitalist art is considered to have been realistic and progressive until the formation of the industrial proletariat, after which it allegedly declined along with capitalism. In contrast, Soviet art is claimed to be excellent, because it reflects Communism. The USSR condemns the principle of "art for art's sake," and asks its artists to be political. This policy was intensified since World War II, with repeated warnings that Soviet artists must avoid Western influence.

6. ARCHITECTURE. European Russia, from the Gulf of Finland to the Caucasus, and from the Polish marshes to the Urals, is flat. This geographical fact has had a profound influence on Russia's history and on its architecture. Great plains and navigable rivers make natural trade routes. But where nature aids commerce it also encourages invasion.

Warriors from Scandinavia founded the Russian state in the 9th century and wood architecture of strong national character developed in northern cities and in the southwestern Ukraine. This type of building was similar to the log cabins of America. From the south came other influences when the young empire was converted to Christianity. Byzantine culture brought with it the art of building in stone.

In the 13th century, these influences were for a time submerged under the conquering Mongol khans from the East. Evidences of Mongol culture still survive in the Volga region. In the Crimea, the Tatars left the imprint of their 300 years' rule. During these occupations, the wood architecture of Russia was largely destroyed and the art of building virtually died. Mainly in the far north, in the Novgorod and Archangel districts, did any important wooden structures escape the torch and sword of the invaders. Many stone churches, monasteries and other religious buildings in various regions survived and served occasionally as substantial fortresses.

By the 15th century the Tatars had been driven from the great plains, and Moscow became the political and religious center of Russia. An intensive period of court and ecclesiastical construction began in the reign of Ivan the Terrible in a style peculiarly Russian though it embraced the original Byzantine motifs and newer influences from Italy. This trend continued until the 18th century when Peter the Great (1689–1725) built his new capital, St. Petersburg. Peter was determined to westernize his country including its architecture. He employed many foreign architects and engineers, most of them French and Italian. The classical style which they brought took strong root in Russia and is still highly regarded by Soviet architects.

First Period (10th–18th Century).—Russia, like the United States, is a country of vast forests. Even recently wood was the dominant building material. Except for the most important churches, entire cities were built of wood. But since wood is perishable (who will forget Tolstoy's description of burning Moscow in *War and Peace*), the recorded history of Russian architecture begins with the oldest stone churches.

The earliest important church is the Cathedral of St. Sophia in Kiev (1020), where Vladimir the Great established the first seat of a metropolitan of the Greek faith. This cathedral with its Syrian and Persian features stemmed almost directly from Byzantine prototypes. But, as the new faith swept northward, the Russian genius for adaptation made many stylistic modifications in architecture. In the Pokrov Church near Vladimir (1163) we see a lessening of Byzantine influence along with a happy blending of Romanesque details. With its wonderful setting on the Nerl River, its simplicity of form, its white stone and gay decorations and its single golden, bulb-like dome, this church is perhaps the loveliest historical monument in all Russia.

Another 11th century cathedral is St. Sophia in Novgorod. Here the great, austere walls show hardly a trace of the rich decorations of Byzantium. But crowning the Romanesque starkness of the exterior are six gilded domes, five of them forming the cluster which became typical of Russian churches.

In this first historical period, religion dominated Russian architecture. But since each church was a center for village life, a vigorous secular architecture of wood developed around the ecclesiastical buildings. During the Tatar invasion, these wood structures strongly influenced even the churches in northern cities. Some were built square, with great log walls. At some distance from the ground, the square was transformed into an octagonal tower by means of unique little arches called *kokoshniki.* The tower itself was topped by a steeply pitched, pointed roof. The Kolomenskoye Church near Moscow (1532), almost literally translating such wood architecture into stone, is a striking example of the power of native tradition.

Architectural historians of the past were wont to call old Russian architecture "semibarbaric" or "Asiatic." The 19th century French architect, Viollet-le-Duc (q.v.), though he never visited Russia, did much to acquaint western Europeans with Russian architecture. He discerned various Oriental influences: Russian churches reminded him chiefly of Chinese pagodas, Hindu temples, Arabian mausoleums, and Byzantine cathedrals. Without overlooking the influence of the East, modern scholars, particularly Russians, have found truer analogies in western European architecture.

In the far-away corners of Europe, particularly in the Russian north, a patriarchal pattern of life and an agricultural economy continued longer than elsewhere. The Romanesque foundation of folk art and building survived later here than in the West, and the influence of wood architecture and ornamentation on stone churches is in evidence everywhere. It is through considering the interplay of foreign culture with vigorous folk art and stubborn native traditions, rather than in observing a few externals, that

we see the true Romanesque nature of old Russian architecture.

Moscow was the center of the later part of this first period of Russian architecture. In the 14th and 15th centuries, master builders from Novgorod and Pskov built palaces and churches of incredible splendor to express the political and religious power of the czars. To rebuild the Moscow Kremlin, Ivan the Terrible imported Italian architects who brought the styles and construction techniques of Europe. For several centuries, this foreign influence was combined with the inevitable Russian flavoring to create many noteworthy structures, the most important of which is the Kremlin itself. The centers (kremlins) of most large Russian cities were enclosed by strong, battlemented walls, which protected the palace and government buildings, and the principal cathedrals, churches and houses. The Kremlin wall in Moscow, built by Antonio Solario in 1490, is of great architectural interest. Although reminiscent in some details of Asiatic fortress walls, it has a native character of its own. Towers of many different styles and form are incorporated in the great wall, the most important of these is probably the Spasskaya Gate in Italian Renaissance style. Interesting old plans have been found in the archives showing the Kremlin redesigned along classic lines. Happily the plans were never realized.

Inside the Kremlin is an extraordinary grouping of secular and religious buildings designed by Russian as well as foreign architects. The Ivan Veliki (great) tower, finished in 1600 by Boris Godunov, is outstanding because of its dome-topped height and splendid design. Surrounding it are many churches with characteristic bulblike domes, convents, and secular buildings, including the Granovitaya or "lesser palace" designed by Italians. The fondness for grouping buildings, especially churches, is typically Russian. Similar free and almost spontaneous compositions are found in every corner of the land, and the same tendency is reflected in the multidomed churches found everywhere. A famous example is the cathedral of St. Basil, built in Moscow's Red Square in 1554 by Ivan the Terrible, with its numerous lanternlike domes and spires. It should be mentioned that the name Red Square did not originate, as many believe, with the revolution. In Russian, the words "red" and "beautiful" are synonymous. Red Square got its name centuries ago when it was Moscow's principal trading center or bazaar. This square had still other uses, however. Ivan the Terrible had his political enemies, the boyars, executed there, and Peter settled accounts in Red Square with the Streltsi (Imperial Guard) who rose against him.

In summary, we may say that medieval Russian architecture does not compare in some ways with the great architectures of the world. Many influences retarded its development. Geography encouraged destructive invasions of Russia. The long-lived feudal economy and the cleavage between the Greek and Roman church were constant barriers to the assimilation of Western civilization. The religious hierarchy restricted architectural innovations and even tried to establish a standard, five-domed church. The Russians relied too frequently on foreign talent, and yet their architecture was vigorous and individual.

Second Period (18th Century to 1917).—Peter the Great was a purposeful man. When he decided to change the backward empire into a modern Western nation he broke literally with the past. He moved the capital to the marshy banks of the Neva where it joins the Gulf of Finland because here was the best "window on Europe" he could find. Both to symbolize and to help execute his purpose he began to import outstanding architects; among them were Leblond from France, hired to make the city plan of St. Petersburg; Carlo B. Rastrelli, Quarenghi, and Rossi from Italy; Cameron from England. He also assembled the noted Russian architects of his day and forcibly gathered up the best masons, carpenters and craftsmen in his realm. To create St. Petersburg as his paradise without rival, he issued a decree that henceforth no stone building could be constructed anywhere else in Russia.

Peter's methods brought results. The classic and baroque designs of the architects were soon translated into stone on a vast scale. After Peter's death in 1725, the momentum of his plan continued under Catherine the Great (1762–1796), aided by foreign court architects and the growing group of Russian masters. By the 19th century, the northern capital was one of the finest cities in Europe. Its systems of great boulevards and monumental open squares, frequently designed by a single architect, served as a worldwide example of city planning and established a deep tradition that is continued today by Russian architects.

According to contemporary accounts, Catherine was greatly interested in architecture; she took personal supervisory charge of many projects, examined buildings and plans, and offered original suggestions. Peter's stone decree was forgotten and the new architecture spread to Moscow and other cities.

As a result of Peter's ideas about commerce and industry many secular buildings were completed during his reign and in the decades following his death. Important examples are the Admiralty (1806) by Sakharov, in the Mining Institute (1806) by Voronikhin, the famous Winter Palace (1732) by the great architect, Rastrelli, the Tauride Palace (1783) by Starov, and the National Museum and Alexander Theater by Rossi (1819–1832). Many of these were built in a sort of Russianized version of Italian baroque. With the reaction in Europe against the excesses of baroque, Russian architecture also became more austere. The Corinthian order gave way to the Doric; the Roman style to early Hellenic. The Hermitage, reconstructed as a museum in 1839 by Leo von Klenze, was in a restrained neo-Greek style. The most striking of St. Petersburg's religious buildings are the Kazan Cathedral (1801) by Voronikhin and the huge Cathedral of St. Isaac (1819) by de Montferrand, both in classic style.

Although St. Petersburg was the new capital, 18th century Moscow continued to grow as a trading center. Architecturally, it tended to cling to the older Russian style, particularly in its churches. But since Moscow was the favorite abode of the nobility, many splendid town houses were built which aped the capital's neoclassic style. Examples are the residence of Prince V. N. Gagarin (1817) and the extraordinary façade of the stable on the estate of Prince Golytsin (1823); the latter might well have served as the entrance to a railroad terminal or museum. Out-

side of Moscow and in other parts of the country, numerous elaborate mansions with pillared porticoes and classic details were built by the landed aristocracy who had an inexhaustible supply of serf labor. Many scenes of Leo Tolstoy's novels and Anton Chekhov's plays were laid in these grand houses so reminiscent of the mansions of our own Old South. All this architectural splendor was only a thin veneer on the poverty and illiteracy of the great mass of Russian peasants.

Under Nicholas I (1825–1855) the buildings in St. Petersburg and Moscow were of banks, hotels, post offices, and railroad stations. The architecture of these buildings was not very interesting and in general followed the neoclassical style of Andrea Palladio (q.v.).

The two main features of this second period in Russian architectural history were the vigorous adoption of classicism and the extraordinary development of the architecture of great public squares, avenues and river embankments. Both features, but especially the latter, continue in contemporary Soviet designs.

Third Period (Post–1917).—The revolution changed many things. In architecture, it reduced for a time the role of the czarist architects. Those who replaced them had less practical experience with actual building, but they had a close relationship with the European extremists in art: the Dadaists, the surrealists, and the constructivists, whose roots went back to prerevolutionary days. To many young Soviet architects and artists, these radical schools symbolized a protest against the old order. In their work these architects broke completely with the accepted traditions.

The new designs were not only unprecedented but often incredibly naïve in their efforts at literal expression. The plans of the Monument to the Communist International by Tatlin (1918) included an ascending spiral form (never actually built), which was supposed to represent the aspirations of the socialist state. A workers' club by Golosov had a roof in the form of a cogwheel, gears and all. Ladovski attempted to interpret current theories of psychoanalysis through architecture. Yet, some buildings of the time had architectural significance. Melnikov, for example, did outstanding work. In his Tram Workers' Club and in other buildings in Moscow, Melnikov strove to express the new social content with bold forms and with startling technical tricks, such as huge glass windows and great concrete cantilevers.

On the whole, these early architectural experiments failed. The excellent material and the precise construction techniques which would have been necessary to execute the designs were simply not available in Russia in those years. Thus, the effects intended failed to materialize, and when a building was completed the concrete edges chipped and the stucco deteriorated within a year or two. In those turbulent days there was no landscaping to set off the buildings, which did not help matters. Moreover, large glass areas were stressed in the designs, with the result that occupants froze in winter from inadequate heating and suffered in summer from the heat and glare of the sun.

Closely related to the extremist group were the architects of the so-called "international" school. This style grew out of the worldwide technical advances in the science of building. Stimulated by the poverty-economy of postwar Europe, the new architects rejected all nonessentials, and regarded themselves as functionalists. When the vast program of the First Five-Year Plan was set into motion, foreign architects were once more invited to Russia. Many of these—May, Meyer, Schmidt, Lurçat and others—were adherents of the "international" school.

Since most of the Soviet planning and engineering officers were in Moscow, the architectural currents of the whole country flowed from there in those early years. Therefore, many important early examples of the new style are in the capital: a block of urban apartment houses by Ginsburg (1932), the Community Center in the Proletarian or auto works' district of Moscow by the Vesnin brothers (1934), the building for the Commissariat of Light Industry by Le Corbusier (1935), and the impressive home of the newspaper *Pravda* by Golosuv (1936). Other examples are the dam and settlement at Zaporozhe (Dneprostroi) and some clubs at Baku.

These "international" style buildings were characterized by simple façades devoid of ornament and by continuous, horizontal windows and balconies expressive of the structural frame. They resemble buildings of the "international" school in the rest of Europe and of the world, though faulty materials and workmanship still plagued the early Russian experiments. The Russian worker, now that the driving tempo and the uncertainties of the First Five-Year Plan were over, finally had time to look about him. He was not impressed by the new architecture. It was not only often shabby, but to his taste seemed stark and unfamiliar.

History is continuous. Movements which seem to represent a sudden break or cleavage with the past usually prove, on examination, to have been developing for some time. While the International style was flourishing, from about 1925–1935, a third school was growing in influence. Most of its adherents were young Russian men and women who had grown up under Soviet institutions and who had had little direct contact with the outside world. They formed what may be called the neoclassic school; their designs are strongly linked to the classic tradition of the 18th and 19th century Russian cities, particularly Leningrad. During this same period, a number of academic architects of prerevolutionary days, for example, Zholtovski and Shusev, also continued to receive important commissions.

To the Russian people the splendid old buildings and the heroic squares and monuments of their large cities symbolized architecturally the good things of life. Now that the success of the industrialization and agricultural programs was assured, it became at last possible to think of better housing, schools, recreational facilities and hospitals, not only for the few but for everyone. The popular interest in architecture grew more powerful and decisive daily. Public preference for the classical was expressed in the press, on the radio and through popular participation in choosing the winners of numerous architectural competitions. Moreover, neoclassicism linked directly with a tradition which was in evidence everywhere, and which had the advantage of being native rather than foreign. Noteworthy examples of this new classical trend are the stately, restful sanatorium at Sochi (Black Sea) by Kuznetsov, the Moscow Hotel by Shusev (1936), and, perhaps most outstanding, the star-

shaped, porticoed Theater of the Red Army in Moscow by Karo Alabian (1938).

Parallel developments were occurring in many republics of the Soviet Union. Stalin encouraged the national minorities throughout the USSR to express their cultures in architecture as well as in the other arts. In Armenia and Georgia, the sheltering greatness of the Caucasus and the skill of the early Christian stone builders have helped preserve many architectural monuments. The church in Talin, Armenia, dates from the 7th century; ancient monuments like this still deeply influence the architecture of Transcaucasia. In 1942, A. Tamanyan was awarded a Stalin Prize for his Government House in Erivan. It is built of local, rose-colored tufa, in a style reminiscent of the old stone architecture. Curiously enough, Tamanyan, who was schooled in the classical traditions of the St. Petersburg Academy of Arts, returned with Soviet encouragement to carry on the proud native traditions of Armenia.

In the Central Asian republics there is an equally intense interest in the historical monuments of their again-great cities. Ancient Samarkand, with its magnificently colored tomb of Timur (14th century) and the exquisite 15th century street of tombs, Shah-i-Zind, is a model for comtemporary Uzbek art. Many critics considered the Uzbek national pavilion the most beautiful building at the 1939 Agricultural Fair in Moscow.

The shift from the functional style was much criticized in certain foreign architectural circles. Some critics felt that the new architectural accent, with its emphasis on national forms, in the Russian and other republics, meant an abandonment of the international ideals of socialism. Others, identifying the classic styles of their own countries with conservatism in government and finance, felt that only the most advanced architectural forms could express the Soviet experiment. Similar controversies sprang up around parallel developments in Russian music, art, and literature.

Since most critics had no direct contact with the situation, they were unaware of the popular dissatisfaction in the Soviet Union with extremist, nondecorative styles. They were equally ignorant of the history of Russian art and architecture and of the intense poular pride in native traditions. They were also naïve in attributing political significance to so-called International or revolutionary art forms. A basic characteristic of Soviet architecture is variety in activities and trends. Its history shows it has been in a constant, vigorous state of flux, in which fixed rules never for long impeded natural creative forces. It cannot be adequately judged by isolated examples which reach the observer.

The state of Soviet architecture is well described in a quotation from a speech made in New York in 1939 by Karo Alabian, president of the Society of Soviet Architects and co-designer of the Soviet Pavilion at the New York World's Fair: "In our country, architects of *all* tendencies—classicists and constructivists—meet in creative competition. . . In the reconstruction of Moscow and other cities, architects, representing widely divergent trends, such as Vesnin, Boris Iofan, Zholtovski, Ginsburg, Golosov, Melnikov and Mordvinov—all have had a part."

Still another architectural school has appeared on the Soviet scene; it is a sort of modernized version of the classic styles. It has met great popular approval and during the postwar period it will probably develop more broadly than the more frankly classical school. The new trend is identified largely with one man, Boris Iofan, who achieved international renown by winning competitions for designs of the Palace of Soviets (1932), and of the pavilions at the Paris Fair (1937) and the New York Fair (1939). Iofan's works are characterized by simple, strong masses which, because of his early training in Rome, are never too far removed from the popular, classic tradition. Prominent sculptors, decorators and mural painters have collaborated with him in his best buildings. The great stainless-steel figures surmounting the Paris and New York pavilions suggest significant future architectural development.

Two factors above all others are influencing Soviet architecture after the Second World War. First there is a need to commemorate the patriotism and heroism of the great struggle. Architects attempt to do this not only in pure monuments but in the architecture of everyday life: in houses, schools, hospitals, public squares, and even in whole blocks and neighborhoods. In all this, national traditions play a large part, but the most significant aspect of Russian tradition relates to the architectural composition of buildings, to the harmonious arrangements of structures, avenues, and squares. Developments in this field reflect the essence of the Russian architectural heritage.

Second, the industrialization of all building trades is being undertaken after the war, and this movement will greatly influence architecture. Before the war, the Soviets wisely devoted their best efforts and resources to branches of their economy which were related to national defense. The field of building lagged behind the more vital industries. In the period of peace, the Soviets emphasize civil construction. Factory-produced building materials and mechanized construction will influence architecture profoundly. Architects of the functional schools continue to play an important role together with their colleagues of the classical and related native traditions.

Housing and City Planning.—The young Soviet Union inherited very bad housing. Peasants and the urban workers were never adequately housed in czarist Russia. Conditions in the old rural villages were inferior enough, but most city workers did not even have privacy. Only in Petrograd (Leningrad) did some workers live in tenements and even here an average of 3½ workers lived in each room. Many buildings were destroyed during the First World War and in the years following, and there was no new construction. Under the Soviets the urban population had doubled by 1939. Moscow and Leningrad grew rapidly. The first step taken by the Soviet government was to redistribute the existing housing more equitably. In Moscow alone over 500,000 additional families were housed in the dwellings of the former middle and upper classes. By 1937 another million were provided with new housing in Moscow. But despite tremendous effort, conditions still remained unsatisfactory. The great postwar task was to double the nation's housing. Even under the stress of war the authorities were preparing to meet this problem;

the establishment of the newest people's commissariat in the USSR, the Commissariat of Municipal and Housing Construction, was announced in May 1944.

Before 1939, much housing was built in new industrial cities such as Magnitogorsk, Komsomolsk, Kirovsk and Stalinogorsk. A number of foreign architects were used on these projects. Many radical experiments were tried and many mistakes were made in this early period. Then followed tendencies in both rural and urban housing toward individual homes and private apartments much in the English and American tradition. The new commissariat proposes that 75 per cent of the Russians made homeless by the war shall be rehoused in one-family dwellings and that "these should be cozy." Such a program needs years of peace.

Because of the extraordinary increase in new urban centers and because of the public ownership of land, the Russians had a great opportunity for city planning, of which they took full advantage. Between 1918 and 1939, the urban population doubled and the number of cities of 100,000 people or more increased from 14 to 74. In the older cities, the need was for reconstruction and expansion. Prominent foreign and native architects submitted planning proposals for Moscow and other cities. Some proposals suggested the wholesale demolition of Moscow; others suggested abandoning the old city and building a new Moscow elsewhere. Obviously, such proposals were rejected; but there development of great cities was begun according to an over-all master plan. The traditional principle accepted for work in this field was that buildings cannot be treated individually but only in relation to each other and to the neighborhood. In general, Moscow was divided for planning or redesign into sections, each of which was placed under the supervision of one architectural group. By 1937, comprehensive plans for the next 10 to 20 years had been prepared for industrial, residential and other areas of most large Russian cities. Both Moscow and Leningrad will have wider streets, better rapid transit, and green belts of parks and forests in accord with Lenin's desire to eliminate too much difference between town and country.

It was possible to plan many new cities from the ground up. In these, industrial and residential planning was based on surveys of local natural resources, topography, and climate. Plans were constantly readjusted in the light of experience. About 1940 the Russians considered 50,000 persons a minimum urban nucleus, and half of all cities, existing and projected, fell in the population group of 50,000 to 1,000,000. The basic planning unit was a super-block of about 20 acres, housing 2,000 to 4,000 people. The typical super-block contained a 22-classroom school and social and shopping facilities.

No historical account of Russian architecture would be complete without mentioning the havoc of the Second World War. The Germans followed a policy of systematic destruction of Russian art. No other nation suffered physical damage of such ferocity and extent. Many ancient cities like Pskov, Novgorod, and Kiev were almost completely destroyed; and many of Leningrad's monuments badly damaged. Yet even during the heaviest fighting Soviet architects and other citizens were working on plans for the restoration of their beloved monuments, and many reconstructions were under way before the end of the war.

Postwar city planning continued during the war. As towns were liberated from Nazi occupation, teams of architects, engineers, and builders moved in with these plans for reconstruction, so that even temporary and emergency building would fit into the master plan.

SIMON BREINES,
Architect.

RUSSIAN SOVIET FEDERATED SOCIALIST REPUBLIC (RSFSR), largest of the 16 Union republics, occupies the entire northern and central parts of the Soviet Union, from approximately 28° west longitude to the Pacific Ocean. In the RSFSR are included the whole of the tundra and most of the forest zones of the USSR, part of the steppe and forest-steppe zones, while in the south (Black Sea coast) one enters the humid subtropical zone. (See USSR—*Geography.*) About one fifth of the population is non-Russian and forms several autonomous bodies within the RSFSR. The areas with predominantly Russian population are divided into regions or provinces (*oblasts*) and territories (*krais*). The capital of the RSFSR is Moscow.

The development of the people of the RSFSR, and particularly of its economy, is an integral part of the history of Russia before 1917 and, under the Soviet regime, of that of the entire Soviet Union. The RSFSR originated from the Soviet Revolution of 1917, although its formal establishment took place several months later.

In December 1922 the 10th All-Russian Congress of Soviets approved the joining of the RSFSR with three other Soviet socialist republics into one Union. On Jan. 31, 1924, the first constitution of the Union of Soviet Socialist Republics was adopted by the 2d All-Union Congress of Soviets. Following this the constitution of the RSFSR was redrafted, and in May 1925 a new constitution of the RSFSR (the second) was adopted by the 12th All-Russian Congress of Soviets.

When the 8th All-Union Congress of Soviets (meeting in special session) adopted on Nov. 25, 1936, a new constitution for the USSR (the second), the RSFSR redrew its constitution. On Jan. 21, 1937, the 17th All-Russian Congress of Soviets adopted this new constitution (the third) of the RSFSR. Under this constitution all authority is vested in the Supreme Soviet of the RSFSR, elected for a term of four years by universal, direct, equal, and secret ballot, with one deputy from every 150,000 inhabitants.

The RSFSR is a federated state. In it are included 15 autonomous Soviet socialist republics, 6 autonomous regions, and 10 national districts. The Autonomous Soviet Socialist Republics (ASSR), with the dates of their formation, are as follows: Bashkir (March 23, 1919); Buriat-Mongolian (May 30, 1923); Chechen-Ingush (Dec. 5, 1936); Chuvash (April 21, 1925); Crimean (Oct. 18, 1921); Daghestan (Jan. 20, 1921); Kabardo-Balkarian (Dec. 5, 1936); Kalmyk (Oct. 22, 1935); Komi (Dec. 5, 1936); Mari (Dec. 5, 1936); Mordovian (Dec. 20, 1934); North Ossetian (Dec. 5, 1936); Tatar (May 27, 1920); Udmurt (Dec. 28, 1934); Yakut (April 27, 1922). The autonomous regions, with the dates of their formation, are as follows: Adygei (July 27, 1922); Cherkess (April 30, 1928); Jewish (May 7, 1934); Karachai (April 26, 1926); Khakass (Oct. 20, 1930); Oirot (June 1, 1922); Tuva (October 1945). The national districts are: Aginsk Buryat Mongol, Chukot, Evenki, Komi-Permiatsk, Koriak, Nenets, Ostiak-Vogul, Taimyr, Ust Ordin Buriat, Yamalo-Nenets.

All of Central Asia used to be included in the RSFSR, but now forms five Union republics within the USSR, which, together with the years of their separation from the RSFSR, are: Turkmen (1924), Uzbek (1924), Tadzhik (1929), Kazakh (1936), Kirghiz (1936). The Karelo-Finnish SSR (March 31, 1940) and the Moldavian SSR (Aug. 2, 1940) include territories which, prior to the formation of these two Union republics, were part of the RSFSR. The German-Volga ASSR, established within the RSFSR on Dec. 19, 1923, was dissolved on Aug. 28, 1941.

Areas predominantly Russian in population form either large administrative units (*krai*, territory), which may contain autonomous bodies of other nationalities, or smaller administrative units (*oblast*, province or region). As a rule, both *krais* and *oblasts* bear the name of the city where the administrative center is located.

The administrative centers of the six territories (*krais*) are as follows: Barnaul (Altai territory), Krasnodarsk, Krasnoyarsk, Vladivostok (maritime territory), Stavropol, Khabarovsk. The following cities are centers of regions or provinces (*oblasts*): Archangel, Astrakhan, Bryansk, Velikiye Luki, Vladimir, Vologda, Voronezh, Gorky, Grozny, Ivanovo, Irkutsk, Kalinin, Kaluga, Kemerovo, Kirov, Kostroma, Kuibyshev, Kurgan, Kursk, Leningrad, Molotov, Moscow, Murmansk, Novgorod, Novosibirsk, Omsk, Oryol (Orel), Penza, Pskov, Rostov (on the Don), Ryazan, Saratov, Sverdlovsk, Smolensk, Stalingrad, Tambov, Tomsk, Tula, Tyumen, Chelyabinsk, Chita, Chkalov, Ulyanovsk, Yaroslavl.

The population of the RSFSR elects to the Supreme Soviet of the USSR (in accordance with the 1936 Constitution of the USSR) one deputy for every 300,000 inhabitants to the Soviet of the Union, and elects to the Soviet of Nationalities (the second chamber of the Supreme Soviet) 230 deputies—25 as a Union republic, 11 from each autonomous republic, 5 from each autonomous region, and 1 from each national district. (See USSR—*Government.*)

With reference to natural and economic features, the RSFSR may be divided into the following 12 areas: (1) the old industrial center, located around Moscow, in the middle of the European part of the republic, between the Oka and Volga rivers, with the cities of Moscow, Ivanovo, Yaroslavl, Gorky, Tula, Ryazan; (2) the black soil area adjoining the first area from the south and partially bordering on the Ukraine, with the cities Oryol (Orel), Kursk, Tambov, Voronezh, Penza; (3) the western part, located between the Moscow area and Belorussia, with the cities of Kalinin and Smolensk; (4) the northwest of the European part, bordering on the Estonian, Latvian, and Karelo-Finnish SSR's, stretching from the Baltic to the Arctic Ocean, including Leningrad and Murmansk; (5) the northeast of the European part of the RSFSR, between the Moscow area, the Arctic, and the north Urals, including Vologda, Archangel, Kirov; (6) the Volga area, the middle and lower Volga, reaching the Caspian Sea, including Kazan, Saratov, Stalingrad, and Astrakhan; (7) the lower Don and the North Caucasus, bordering in the south on the Caspian, with Rostov-on-the-Don, Novorossisk, Grozny; (8) the Crimea, a peninsula extending into the Black Sea, with Sevastopol and Kerch; (9) the Urals, the area of the mountain range that separates Europe from Asia, with Sverdlovsk, Chelyabinsk, Magnitogorsk; (10) Western Siberia, from the Urals to the Yenisei (Enisei) River, and from the Arctic to the Altai Mountains, with Omsk, Tomsk, Novosibirsk; (11) Eastern Siberia, from the Yenisei to the watershed ranges lying along the Pacific, with Irkutsk, Yakutsk, Chita; (12) the Soviet Far East, the Pacific coast area, from the borders of Korea to the Bering Straits that separate Siberia from Alaska, including Vladivostok, Khabarovsk, Komsomolsk, Petropavlovsk (Kamchatka). (See USSR—*Natural Resources.*)

The population of the RSFSR numbered (according to the census of Jan. 17, 1939) 109,000,000, of which 37,000,000 lived in cities. Since the previous census (Dec. 17, 1926) the population had increased 17 per cent, the urban population increasing 118.4 per cent and the rural declining 5.3 per cent. In the Asiatic part of the RSFSR, including the Urals, the population increased between the two census dates by 33 per cent. In 1926 cities with a population over 100,000 numbered 22; in 1939 they had risen to 55. Whereas in 1926 there were three cities with a population over 250,000, in 1939 there were 19 such cities.

Before the Second World War the RSFSR accounted for approximately 70 per cent of the industrial production of the USSR. In the 1930's industrialization progressed rapidly, particularly in the previously backward areas. From 1917 to 1937 the industrial output of the RSFSR increased 8.4 times, while in many of the autonomous republics there took place a 10 to 15 fold growth. The RSFSR has approximately 90 per cent of all the coal resources of the USSR. A very large share of all machine-building, the chemical industry, lumber and paper industry, production of cement and of the fisheries of the Soviet Union is within the RSFSR. In 1938 the RSFSR had 173,000 collective farms, 2,592 Soviet farms, and 4,324 machine and tractor stations. In its Asiatic part the RSFSR contains the large river systems of the Amur, Lena, Yenisei and Angara, Ob and Irtysh; in Europe the Volga with its tributaries and canal connections.

In World War II the RSFSR was invaded in the north and south. Its second

largest city, Leningrad, was besieged, the Crimea, the rich industrial Donets Basin, and the agricultural Kuban plains were overrun, and the enemy reached as far as Stalingrad on the Volga. But Moscow and a large part of the surrounding industrial area, the lands east of the Volga, the Urals and Siberia, continued production. The vast natural, industrial and manpower resources of the RSFSR, the core of the Soviet Union, made immense contributions toward expelling the enemy from Soviet territory and inflicting a final defeat on Hitlerite Germany.

RUSSO-JAPANESE WAR. See JAPAN; UNION OF SOVIET SOCIALIST REPUBLICS—*History.*

RUSSO-TURKISH WARS. The many wars fought between Russia and Turkey over a period of several centuries varied widely in their motivation and usually were but parts of much broader international conflicts. The latter was particularly true of the Russo-Turkish conflicts from the last half of the 18th century up to and including the First World War.

The final destruction of the Byzantine Empire by the Turks came with the capture of Constantinople (1453), but this did not have any immediate effect on the foreign policy of the Moscow state. Cultural and commercial ties with the Byzantine Empire had already been interrupted during the "Latin empire" (1204–1261) established by the Crusaders in Constantinople, and the conquest of Russia by the Tatars (first half of the 13th century) contributed to Russia's isolation. Although the Turkish invasion of the Crimea (1475) made its Tatars vassals of Turkey, Crimean designs against the Lithuanian state in the west and other Tatar states on the Volga in the east were even strengthened. Since the latter were also enemies of the young Moscow state, it was to Moscow's interest to establish good relations with the Crimea and the Turkish Empire.

Ivan III (r.1462–1505) sent an embassy to Constantinople (1497) and both he and his son, Vasili III (r.1505–1533) steadily resisted advances made by Western powers and the Vatican to join in an anti-Turkish coalition. Moscow's old enemies, the Tatars of the Golden Horde on the lower Volga were destroyed (1502) by the Crimean Tatars. Thus Moscow succeeded in "destroying one Tatar by means of another." But in the 16th century hostilities with the Crimea developed, and from 1507 on Russia was subjected to repeated Tatar raids from the south. Thus the Russo-Turkish conflict began indirectly through Moscow's clash with the vassals of the sultan.

Under Ivan IV (r.1533–1584) Russia conquered the Kazan Tatars on the upper Volga (1552) and the Astrakhan Tatars on the lower Volga (1556), and penetrated into the Caucasus. Russia's expansion toward the Caspian Sea was regarded by Turkey as a threat to her empire. The Russians were soon forced to withdraw from the approaches to the Caucasus (1571); meanwhile the activities of the Crimean Tatars were hampering Russia's efforts in the Livonian War (1558–1583), fought unsuccessfully by Ivan IV to obtain access to the Baltic Sea.

The long struggle with the Polish-Lithuanian state absorbed much of Moscow's strength; against the Crimea the emphasis was on defensive measures. In 1637 the Don Cossacks captured Azov from the Turks, but Moscow could not support the venture, and the city was abandoned (1642). The Russo-Polish struggle developed also in the Ukraine, which came under Moscow's protectorate in 1654. Here the clash with Crimean and Turkish interests became direct. Moscow now attempted to form a coalition of powers against Turkey, sending missions to England, France and Spain (1667 and 1672) and also trying to interest Vienna, Venice and the Vatican. But Europe was too busy with the wars of Louis XIV of France (q.v.). Russia's war against the Crimea and Turkey (1676–1681) was ended, without gains to Russia, by a 20-year armistice at Bakhchisarai (January 1681). The conclusion of the "eternal peace" with Poland (1686) both freed Russian forces and carried with it a stipulation for joint action with Austria and Poland against the Turks. Although the defeat inflicted on the Turks at Vienna (1683) had relieved the immediate Turkish threat to the west, Russia undertook two military expeditions against the Crimea (1687 and 1689), which ended in complete failure.

Peter the Great's (r.1682–1725) quest for an exit to the sea began with an expedition against Azov (1695), but having no navy the Russians could not take the city. After building a navy in Voronezh, Peter sailed down the Don and took Azov (1696). In 1700 a 30-year armistice was signed with Turkey. Russia kept the city of Azov, but the exit from the Sea of Azov into the Black Sea remained in the hands of the Turks. When, after the defeat at Poltava (1709), Charles XII of Sweden (q.v.) fled to Turkey, there followed a campaign by Peter against the Turks. On the river Prut the Russians were surrounded by superior forces, and Peter sued for peace. The Russians surrendered Azov, and Peter had to abandon the effort to establish Russia as a Black Sea power.

Under Empress Anna (r.1730–1740) Russia again fought Turkey, in alliance with Austria. Russian troops penetrated the Crimea and reached the mouth of the Dnieper (Dnepr). This war (1736–1739) proved expensive in men and money, but was on the whole unsuccessful. Peace was concluded in Belgrade (1739). Russia obtained territories on both banks of the Dnieper, but no access to the Black Sea.

The surge in the direction of the Black Sea continued under Catherine II (r.1762–1796). Catherine's first war against Turkey (1768–1774), who was supported by France, resulted in several victories on land won by Peter Alexandrovich Rumiantsev (1725–1796) and Alexander Vasilyevich Suvorov (1729–1800). The Russian Navy sailed around Europe from the Baltic into the Mediterranean and inflicted a defeat on the Turkish Fleet in the Aegean Sea (1770). By the Peace of Kuchuk-Kainardzhi (Kainardji) (July 1774) Russia received the right to fortify Azov, an exit to the Black Sea through the Kerch Straits was obtained, and all Tatars north of the Black Sea were to be "independent" of Turkey. Russia's border now stretched from the Bug to the Don.

Although Russia had reached the Black Sea, Catherine envisaged further conquests. The so-called "Greek project" of Grigori Alexandrovich Potyomkin (Potëmkin) (1739–1791) captured the imagination of the court, which began to think of expelling the Turks from Europe altogether and of re-establishing the old Byzantine Empire. Catherine's second grandson (b. 1779) was named Constantine, reputedly to be the prospective emperor. In 1783 Russia annexed the Crimea, an act that Turkey could not leave unchallenged. There ensued Catherine's second war against Turkey, the latter receiving England's support. This war (1787–1791) was successful largely because of several brilliant victories by Suvorov. By the Peace of Jassy (1791) Turkey accepted Russia's annexation of the Crimea. Russia began to settle the Black Sea coast, founding Sevastopol (1784) and Odessa (1794).

For a time the struggle against revolutionary France united Russia and Turkey within a coalition of several powers. Russia's Black Sea navy together with the Turkish Fleet operated in the Mediterranean under F. F. Ushakov (1745–1817), who captured the island of Corfu (1798) and collaborated with the Greek independence movement of the day. However, this coalition against France soon broke up. Russia's inclusion of Georgia in the empire (1801) and continued penetration beyond the Caucasus brought about a war with Persia (1805–1813) and Turkey (1806–1812). In this conflict Persia and Turkey had the support of both England and Napoleon (q.v.). On the eve of Napoleon's invasion of Russia, peace was signed in Bucharest (May 1812), with most of Russia's acquisitions in the Transcaucasus acknowledged, and Bessarabia ceded by Turkey to the Russian Empire.

Emperor Nicholas I (r.1825–1855) regarded Turkey as the "sick man of Europe" and favored the partition of that country. Russia was now firmly entrenched on the Black Sea, but the czar's further plans gave rise to the so-called "eastern question," involving most of the European powers. Russia's ambitions in the Near East led Nicholas I, otherwise a staunch opponent of people's movements, to take a favorable interest in the Greek war for liberation (1821–1832). Austria supported the sultan, but England insisted on joint action of the powers on the Greek question. Turkey was forced to recognize (1826) Russia's right to support autonomous principalities in the Balkans, and in 1827 a joint Anglo-French-Russian fleet annihilated the Turko-Egyptian Navy in the Battle of Navarino in the Mediterranean. A new Russo-Turkish war ensued (1828–1829). After initial reverses on the Danube, the Russians took Adrianople and also achieved big successes in the Caucasus. Now Austria began to arm, and pressure was brought on Russia by England and France. The Peace of Adrianople (1829) gave Russia a strong influence in Turkish affairs. Nicholas I continued his penetration into Near Eastern matters, taking advantage of a struggle between Turkey and Egypt, and in 1833 obtained practically a decisive influence in the internal affairs of Turkey. This led to a sharpening of relations with England. In 1840 Turkey was placed under joint protection of European powers. Nicholas' suggestion to England (1844) that Turkey be partitioned was rejected. Although the czar had to retreat, international conflict over the "eastern question" continued. In 1850 there arose a dispute over the rights of the Roman Catholic and Greek Orthodox churches in Jerusalem. This controversy was utilized by the czar, as "protector" of Greek Orthodox interests, for new claims against Turkey. In November 1853 the Russian Black Sea navy under P. S. Nakhimov (1803–1855) destroyed a Turkish squadron in the Bay of Sinope, and France and England joined Turkey in a war against Russia.

The war of 1853–1856, known as the Crimean War, was fought in several theaters. On the Danube, Russian operations against the Turks were not successful, while in the Caucasus the Russians scored considerable gains. A joint Anglo-French-Turkish army landed in the Crimea in September 1854. Russia's Black Sea navy was sunk to block the entrance to the harbor of Sevastopol. In a siege lasting 349 days the grounded Russian sailors and the army stubbornly defended the city, but Sevastopol had to be abandoned by the Russians in September 1855. Although England wanted to continue the war, peace was concluded in Paris early in 1856. Russia's successes in the Caucasus helped soften the peace terms. The Crimea was retained by Russia, but she had to give up territorial gains in the Transcaucasus, lost the right to have a navy in the Black Sea, Turkey's independence was guaranteed by the powers, and access to the Black Sea was made free to all powers.

In 1870 the Franco-Prussian War enabled Russia to abrogate most of the provisions of the Peace of Paris (1856) and to establish herself again as a military power on the Black Sea, with the control of the Straits reverting to Turkey. When a few years later a war of liberation of the Balkan Slavs against Turkey broke out, Russia extended support to the Slavs. The czar encouraged the expressions of public opinion in Russia favoring the "Slav brothers." Again the powers tried to intervene, but in April 1877 Emperor Alexander II (r.1855–1881) declared war on Turkey. The war proceeded both in the Balkans and in Transcaucasia. Turkey received equipment from Europe, and the campaigns proved more difficult than the Russians at first expected. However, by 1878 the Russians were victorious in both theaters and threatened Constantinople. In view of England's war preparations, a preliminary peace was signed in San Stefano (March 1878) on terms favorable to Russia. Under pressure from England and Austria, Russia consented to a revision of this settlement, for which purpose an international congress was called in Berlin (summer of 1878). At Berlin, Russia found herself opposed by all the powers. By the Peace of Berlin, although the Balkan Slavs obtained varying degrees of independence, Russia was stripped of many of her gains and did not obtain control of the Straits, which were left in Turkish hands.

With the rise of imperial Germany, her allies, Austria and Italy, began to play a larger role in Balkan affairs, and Germany's influence grew in Turkey. In World War I Turkey fought against Russia, England and France. The Russian campaign proceeded in the Transcaucasus, with the Russians eventually joining forces with the English advancing from Mesopotamia. The Russian Empire was determined this time to realize its long cherished ambition and again raise the cross on St. Sophia in Constantinople, turned into a mosque by the Turks in the 15th

* Pp. 37–63 omitted. Subject matter under Union of Soviet Socialist Republics.

century. However, czarist Russia came to an end in the revolution of 1917. By the terms of the Treaty of Brest-Litovsk (March 1918) Germany and Turkey penetrated the Caucasus. But their military collapse soon followed, and then came the revolution in Turkey and the establishment of a republic. Peace between Soviet Russia and the Republic of Turkey was concluded in 1921, and with it came one of the earliest Soviet treaties of friendship with another power. Both countries had completely changed internally, and a new set of relationships began to develop.

For bibliography, see UNION OF SOVIET SOCIALIST REPUBLICS—*History*.

RUST, in botany, any of numerous minute parasitic fungi (order of Uredinales) causing spots of discoloration of the tissues in higher plants. They are primitive basidiomycetes, often heteroecious, passing through their life stages on different hosts. The wheat rust *Puccinia graminis* is a well-known example of a rust destructive to grain crops.

RUST, ferric oxide, formed by the gradual oxidation of iron when exposed to the air. Carbon dioxide is, if not a necessary factor, a powerful accelerant of the action. To remove rust the usual mode is to rub the object with a piece of oiled rag or emery paper. More rapid and more satisfactory results are secured by using very pure petroleum, and wiping with a hempen or woolen rag. To prevent rust, dip iron or steel articles in a mixture of equal parts of carbolic acid and olive-oil, rubbing the surface with a rag. Others rub the metal with a mercurial ointment, leaving a thin layer of mercury over the entire surface. If iron be dipped in a solution of carbonate, chromate or bichromate of potash or soda in water the surface will be protected by a tenacious film of oxide against rust for a long time, and objects can be protected for any period by burying in quicklime. Rubbing the surface with plumbago has a similar effect.

RUSTCHUK, roos'chook, Bulgaria, a town on the right bank of the Danube, at the confluence of the Lom, opposite Giurgevo, 42 miles southwest of Bucharest. It has some woolen, silk and other manufactures and considerable trade. It was of strategic importance owing to its position on the old Turkish frontier, and was almost destroyed by the Russian bombardment in the War of 1877–78.

RUSTON, La., city and Lincoln Parish seat; altitude 311 feet; 30 miles west of Monroe, on the Chicago, Rock Island and Pacific; and the Yazoo and Mississippi Valley railroads. There are cotton and dairying interests. The discovery of natural gas near by in 1935 gave impetus to industry. The Louisiana Polytechnic Institute is located here. Ruston was settled in 1884. Pop. (1950) 10,372.

RUTABAGA. See TURNIP.

RUTACEAE, rōō-tā'sē-ē, a widely dispersed family of polypetalous plants with about 950 species, most frequent in warm regions, and especially so in South Africa and Australia. They are generally shrubs or trees, bearing leaves in various forms, without stipules, dotted with glands and often heavy-scented. The four- or five-parted flowers are often in axillary cymes and the fruits are various, being most conspicuous in the genus *Citrus,* which produces the orange and lemon. Two American genera are *Ptelea* (hop-tree), and *Zanthoxylum,* or prickly ash. The latter is represented by small trees, prickly, with a powerfully stimulative and tonic bark. The common rue is a member of the typical genus *Ruta.*

RUTGERS, Henry, American philanthropist: b. New York, Oct. 7, 1745; d. there, Feb. 17, 1830. He was graduated from Columbia in 1766; served as captain in the Revolutionary War and later as colonel of New York militia, and entered the legislature in 1784 to which he was frequently re-elected. He was a member of the board of regents of the New York University from 1802 to 1826. His gifts to public purposes were many, the chief being $5,000 to Queen's College of New Jersey, which thereupon took the name of Rutgers.

RUTGERS SCIENTIFIC SCHOOL, a department of Rutgers University, New Brunswick, N. J., designated by law as the New Jersey State College of Agriculture and Mechanic Arts. See RUTGERS UNIVERSITY.

RUTGERS UNIVERSITY, New Brunswick, N. J., founded as Queen's College Nov. 10, 1766, under a charter granted by George III, was the eighth college to be established in the American colonies. In the charter, which was slightly altered in 1770, the purpose of the college was set forth as "the education of youth in the learned languages, liberal and useful arts and sciences." The college was opened at New Brunswick in 1771, but when the British occupied the city during the Revolution, classes were held temporarily at Millstone and at North Branch. The present site of the college was acquired in 1808. Here the following year was erected Queen's building, a fine example of Georgian Colonial architecture, designed by John McComb. In 1825 the name was changed to Rutgers College in honor of Col. Henry Rutgers, (q.v.) whose benefactions aided the struggling young college. In 1864 the Rutgers Scientific School was designated by the State Legislature as the New Jersey College for the benefit of Agriculture and the Mechanic Arts, to be maintained by the Board of Trustees under contract with the State. The pioneering work in agricultural science that soon followed at the college farm, resulted in the founding in 1880 of the New Jersey Agricultural Experiment Station, the third American experiment station to be established by State legislation. With the gradual expansion of State services in technical education and research, the Legislature in 1917 designated the college as the State University of New Jersey. The New Brunswick Theological Seminary, of the Reformed Church of America, originally was affiliated with the college, but in 1856 it became a separate institution. The name Rutgers University was adopted in 1924. The university now comprises the following divisions: College of Arts and Sciences (1766), College of Engineering (1864), College of Agriculture (1864), Department of Ceramics

(1902), New Jersey College for Women (1918), School of Education (1923), University Extension Division (1925), New Jersey College of Pharmacy, at Newark (1927), School of Chemistry (1930), University College (1934). Undergraduate and graduate curricula lead to the following degrees: Bachelor of Arts, Bachelor of Letters, Bachelor of Science, Bachelor of Business Administration, Civil Engineer, Electrical Engineer, Mechanical Engineer, Master of Arts, Master of Science, Master of Education, Master of Library Science, Doctor of Education, and Doctor of Philosophy. Rutgers is the only land-grant college that has a colonial charter. There is a staff of 880 full-time faculty members. Undergraduate students number 5,401, graduate students 374, and the total enrollment is 16,319, including part-time and summer students. Rutgers is a coeducational university. Among the noteworthy collections to be found in the university's library are sets of scientific works, and materials relating to the government and history of New Jersey.

CARL R. WOODWARD,
Secretary.

RUTH, George Herman (Babe), American baseball player: b. Baltimore, Md., Feb. 6, 1895; d. New York City, Aug. 16, 1948. He learned to play baseball at St. Mary's Industrial School, a Catholic institution in Baltimore to which his parents sent him when he was 7 years of age. He began his professional career in 1914 as a left-handed pitcher on the Baltimore Baseball Club, and before the close of the season was sold to the Boston American League team, with which he developed into one of the best left-handed pitchers of all time. However, he demonstrated such remarkable hitting ability that he frequently was played at first base or in the outfield. In 1919 he hit 29 home runs, regarded then as a remarkable feat. On Jan. 3, 1920, he was sold to the New York American League team (the Yankees) for $100,000, plus a personal loan to the owner of the Boston team of $370,000.

During his 15 years with the Yankees, Ruth developed into the greatest attraction the game of baseball has ever known, and by long odds the highest salaried player of his day. He was the idol of the fans, and the hero of the younger generation—a popularity that never deserted him. He remained with the Yankees until the end of the 1934 season, then signed with the Boston National League team for 1935, but did not play out the season.

In 22 years of major league play, he set or tied 76 records. He hit a total of 714 home runs (60 in one year, 1927), drew 2,056 bases on balls, and struck out 1,330 times. His pay for playing in 1930 and 1931 was $80,000 for each year. He was so much of an attraction that the $2,000,000 Yankee Stadium is still called the House That Ruth Built. He played in 10 World Series, and set a number of records for series play. These include hitting three home runs in one game, which he did twice, 1926 and 1928; highest series batting average, .625, 1928; most total runs, 37 in 10 series, 41 games; and pitching 29⅔ consecutive scoreless innings: Oct. 9, 1916, Boston American League, 13⅓ innings; Sept. 5, 1918, 9 innings; Sept. 9, 1918, 7⅓ innings.

He was a born showman. Everything he did was done with gusto. He was as impressive when he struck out as he was when he hit a home run. After his death his body lay in state in the Yankee Stadium before burial so that his thousands of admirers might have an opportunity to pay him a last tribute, and 77,000 persons filed past him there, many of them in tears.

A few years before his death he established the Babe Ruth Foundation for underprivileged children, and bequeathed to it a considerable part of his estate.

RUTH. A Moabitess, whose story is given in the 8th book of the Old Testament; daughter-in-law of Naomi, and wife, first of Mahlon, and then of Boaz. She is especially remembered for the disinterested love which displayed itself in her resolute refusal to forsake her mother-in-law in the latter's distress. The words (Ruth 1:16-17) "Entreat me not to leave thee, . . ." are among the most beautiful in all literature.

RUTH, Book of. Old Testament book so named after the chief character in the narrative. A famine compelled Elimelech, and Ephrathite of Bethlehem-Judah, to take his wife Naomi and their two sons to the country of Moab, where one of the sons married Ruth, a Moabitess. When Naomi, after losing her husband and her two sons, returned to her own land, Ruth, her daughter-in-law insisted on going with her. Here a Hebrew named Boaz, accepting the duty of the next-of-kin, married her, and she became the great grandmother of David. The action is placed in the period of the Judges, and most of the narrative is written in a pure and early style of Hebrew, but the Book seems at least to have been edited at a later date (note the late words in 1:13 and 4:7, 18:22. The purpose of the story may have been either to emphasize the duty of the next-of-kin to marry a childless widow, or to justify the legitimacy of intermarriage with foreigners.

RUTHENES, RUTHENIANS, RUSSNIAKS, or **LITTLE RUSSIANS,** are Slavonic tribes inhabiting, prior to World War II, countries bordering Soviet Russia. They are part of the "Little Russians" who dwell in the Ukraine. The number of Austrian Ruthenes amounted to about 3,500,000; according to some authorities there were over 4,000,000, of whom 500,000 were settled in the northeast provinces of Hungary, 300,000 in the northwest of Bukowina, and the remainder in Galicia. The name "Ruthene" is merely the German and Austro-Hungarian title for "Ukrainian"; by whatever name they are called, they are one people, and form a racially compact mass of some 30,000,000 souls, extending from the Dnieper to the Carpathians into Hungary. Russia regards the Little Russians as an integral part of the Great Russian family and their language as a Russian dialect. Austria, on the other hand, encouraged the Ruthenes to regard themselves as a separate Slav race and their language as a distinct Slav idiom. As Rambaud has pointed out, some writers have been anxious to establish the existence of a profound difference between the Great Russians and their two neighbors, the White and the Little Russians. The dialectical differences between the idioms of these three families are easily traceable to historical and literary influences. The Little Russian dialect is spoken by over 26 per cent of Russian-speaking races.

The Carpathian Ruthenes are divided into Boiki, Lemki, Gutsuli and Ugorski Ruthenes. Of these the Boiki inhabit the central portion of the northeastern slope of the Carpathians. They wear long hair and are sometimes clean-shaven—in marked contrast to the Slavs of Russia proper. Their chief occupation is cattle-breeding. The Lemki live between the northern frontier of the Boiki as far as the River Poprad. They are much under the influence of the Slovaks and their dress differs considerably from that of the other Ruthene tribes. Their hair is cropped short and their faces are always clean-shaven. The Gutsuli inhabit the southwestern region of Eastern Galicia, West Bucovina, and southeastern Ugorsakya Rus, forming in reality a single people divided into three by political boundaries. Dwelling in remote mountain districts they alone among the Austro-Hungarian Ruthenes escaped serfdom and developed among themselves a comparatively high degree of well-being. Their manner of life has fostered among them the love of arms and a fondness for finery in dress. To a greater degree the Gutsuli have preserved their ancient heritage in dress and habits than other Ruthene tribes. The Ruthenes of the Galician plain reproduce in their dress and buildings the more typical features of life in the neighboring Volhynia and Podolia provinces of Russia, whereas in Bucovina the obtrusion of Rumanian influence is marked. The Ruthenian peasants of Eastern Galicia lived in wretched circumstances; they were mere farmhands tied to the soil by a miserable pittance from the landed gentry, who owned much of the land and held practically all administrative posts. The bulk of the Ruthenes belong to the Uniate Church, which means that they acknowledge the Pope, but retain the outward forms of the Greek Church and have married priests. Despite the published official statistics, it was the Ruthenes and not the Poles who are in the majority within Galicia. Under the franchise law of 1907 the Poles obtained 78 seats in the new Parliament, while the Ruthenes were given 28 seats. By a compromise effected in February 1914 the Ruthenes were guaranteed a representation of 27 per cent in the legislature. Yet the Ruthenes were in many respects better off under Austrian than Russian rule. They were permitted their own schools (about 2,500), social and political clubs and their own language and literature. The University of Lemberg, established by Emperor Joseph II for the Ruthenians alone, was appropriated by the Poles. Directly following the end of World War I the Ruthenian section of Galicia was joined to the short-lived Ukrainian Republic. In the division of territory which resulted from the various peace treaties the territory occupied by the Ruthenians was divided among the Succession States. Carpatho-Ukraine became a province of Czechoslovakia, Bucovina was awarded to Rumania, and Eastern Galicia became part of Poland, until Poland's partition in 1939 brought it into the Russian fold. In June 1945 Czechoslovakia yielded her Carpatho-Ukraine province to Russia. Then the World War II peace treaty with Rumania transferred Bucovina to Russia, thus completing the integration of Ruthenian populations in the Soviet Ukrainian Republic. See UKRAINE; CZECHOSLOVAKIA; RUMANIA.

RUTHENIUM, a metal of the platinum group. It has the atomic weight 101.7, and the symbol Ru. Some specimens of platinum ore contain from 3 to 6 per cent of ruthenium. It is a whitish-gray metal, having a specific gravity of 11 to 11.4 and after fusion of 12.063; is very fusible, more so than any other metal except osmium; is scarcely attacked by nitromuriatic acid, but is more easily oxidized by fusion with nitre, chlorate of potassium, etc. than platinum. Ruthenium forms a series of salts which are analogous to those of platinum.

RUTHERFORD, rŭth'êr-fêrd, **Ernest,** 1ST BARON, British physicist: b. Nelson, New Zealand, Aug. 30, 1871; d. London, Oct. 19, 1937. He was educated at the University of New Zealand and at Trinity College, Cambridge, England. From 1898 to 1919, he was professor of physics at McGill University, Montreal, and at Manchester University, England. He later became Cavendish professor of experimental physics and a fellow of Trinity College, Cambridge. In 1908, he received the Nobel Prize for chemistry. He identified the three principal types of radioactive emanations, the work resulting in his theory of radioactive disintegration. It also led to his ideas of nuclear and atomic structure, generally known as the Bohr-Rutherford theory. In 1919, he showed that high-energy alpha-particles could be used to produce disintegration of nitrogen nuclei, discovering the first of those transmutations which became numerous in later nuclear physics. He wrote *Radioactivity* (1904); *Radiations from Radioactive Substances* (with James Chadwick and C. D. Ellis, 1930). A biography of him was written by A. S. Eve, entitled *Rutherford* (1939).

RUTHERFORD, borough, N. J., in Bergen County, altitude 100 feet, on the Erie Railroad, 9 miles from downtown New York. It is a residential town. Cultural interests include a Little Theater guild and a choral society. The town was named for John Rutherford, patriot and friend of George Washington. Pop. (1940) 15,466; (1950) 17,411.

RUTHERFURD, Lewis Morris, American astronomer: b. Morrisania, N. Y., Nov. 25, 1816; d. Tranquility, N. J., May 30, 1892. He was graduated from Williams College in 1834, admitted to the bar in 1837, and practiced law in New York until 1849. He then devoted himself to the study of science, making valuable investigations in the departments of astronomical photography and spectral analysis. He made several instruments for use in his laboratory, among which were an object glass, a micrometer for measuring astronomical photographs and a dividing engine (q.v.) of great value. He was a trustee of Columbia College from 1858 to 1884, when he resigned and presented his astronomical instruments to that institution.

RUTHVEN, Raid of. See GOWRIE CONSPIRACY.

RUTILE, titanium oxide TiO_2 in tetragonal form, the chief source of titanium; also used as a gem and for coloring matter for porcelain and artificial teeth. There are deposits in Virginia.

RUTLAND, town, Massachusetts, Worcester County; altitude 1,250 feet; 12 miles north of

Worcester. Because of its high altitude, several tuberculosis sanatoriums are located here, providing a market for local dairy and poultry products. Rutland was settled in 1716, and became a town in 1722. After the surrender at Saratoga, part of Burgoyne's troops were quartered here in 1777–1778. Pop. (1940) 2,181; (1950) 3,056.

RUTLAND, city, Vermont, Rutland County seat; altitude 560 feet; on Otter Creek, the longest river in the state; on the Rutland Railroad; and with freight service over the Delaware and Hudson Railroad; by rail, 67 miles south of Burlington; with an airport six miles distant. Surrounding Rutland is a fertile farming region, and the city is the trading center for a considerable group of smaller towns. In the county the quarrying, cutting, and finishing of marble is a leading industry; in the city are railroad shops, and establishments manufacturing scales, boilers, maple sugar equipment, dresses and underwear. Rutland, however, is best known as the Marble City, and the building of the railroad opened the way for development of a merely local industry into one commanding the national market. It is Vermont's second largest city, and is widely known as a winter sports center.

Rutland has a number of old buildings, some dating back to pre-Revolutionary times, and many fine modern structures. The first actual settler was James Mead, who in 1770 built a log house near the Center Rutland Falls, now locally known as Mead's Falls. In 1784, seven years before Vermont became a state of the Union, Rutland was made county seat. From 1784 to 1804 it was the scene of a number of meetings of the legislature. In 1886 the township was partitioned, two new townships, Proctor and West Rutland, being created. The present city of Rutland was organized in 1892. It has a mayor and council. Pop. (1950) 17,647.

RUTLEDGE, Ann. See LINCOLN, ABRAHAM.

RUTLEDGE, rŭt'lĭj, **Edward,** American soldier and legislator: b. Charleston, S. C., Nov. 23, 1749; d. there, Jan. 23, 1800. He was admitted to the bar in 1773, established a practice in Charleston and in 1774 was elected to the Continental Congress. He was a signer of the Declaration of Independence in 1776 and a member of the first board of war. In this capacity he was delegated with John Adams and Benjamin Franklin to confer with Lord Howe on the subject of a reconciliation, but declined to treat with him excepting on the basis of American independence. As lieutenant colonel of the Charleston artillery he assisted in expelling the British from Port Royal in 1779 and in 1780 was captured. After his release a year later he resided in Philadelphia, and was a member of the Jacksonborough legislature in 1782.

RUTLEDGE, John, American jurist: brother of Edward Rutledge (q.v.); b. Charleston, S. C., 1739; d. there, July 18, 1800. He studied law in England, returned to Charleston in 1761 and there established himself in law practice. From the outset of his career he was an ardent opponent of the oppressive laws governing the colonies and as delegate to the congress at New York in 1765 openly advocated the united resistance of the colonies. In 1774 he was a member of the South Carolina convention which carried a resolution that South Carolina should be represented in the Continental Congress. He served as delegate to the Congress of 1775 and in 1776 was chairman of the committee that framed the South Carolina constitution, was elected president of the state government and commander in chief of the militia. When the British forces arrived off Cape Fear he fortified Charleston and prevented the invasion of the state. He resigned his office in 1778 through dissatisfaction with changes in the constitution, but was recalled in the following year and invested with dictatorial authority. He at once set about preparations for defense and held the city until 1780. He then joined the forces of General Greene and upon the recapture of Charleston resumed his duties as governor. In 1782 he was elected to the Continental Congress, was re-elected in 1783 and in 1784 became chancellor of South Carolina. He was a member of the convention which framed the Constitution of the United States in 1787. He became chief justice of his state in 1791 and in 1795 was appointed chief justice of the Supreme Court.

RUTLEDGE, Wiley Blount, Jr., American jurist: b. Cloverport, Ky., July 20, 1894; d. York, Me., Sept. 10, 1949. Nominated to the United States Supreme Court by the late Franklin D. Roosevelt on Jan. 11, 1943, Associate Justice Rutledge, an earnest defender of civil liberties, was considered a member of the court's "liberal bloc," made up of Justices Hugo L. Black, William O. Douglas, and the late Frank Murphy.

The son of a Baptist preacher, he attended Maryville College in Tennessee and was later graduated as a bachelor of arts from the University of Wisconsin in 1914. After a year of teaching commercial subjects at Bloomington (Ind.) High School and of studying law at the same time, he accepted a full time teaching position at Connersville, Ind., where he contracted tuberculosis. In 1917 he went west to Albuquerque, N. Mex., took a position there as secretary to the city's school board, recovered his health, and then returned to his law studies, receiving his bachelor of laws degree from the University of Colorado in 1922.

After practicing law in Boulder, Col., from 1922 to 1924, Rutledge resumed his teaching career, specializing in the study of law. He was associate professor of law at the University of Colorado, 1924–1926; professor of law at Washington University, 1926–1935, acting dean, 1930–1931, and dean of the School of Law, 1931–1935; and professor of law and dean of the College of Law, State University of Iowa, 1935–1939.

In 1939, President Roosevelt appointed Rutledge an associate justice of the United States Court of Appeals for the District of Columbia. On Feb. 15, 1943, Rutledge was sworn in as an associate justice of the United States Supreme Court, succeeding James F. Byrnes, who had resigned to become director of the Economic Stabilization Board.

RUWENZORI, roo-wĕn-zō'rē, a group of mountains in Africa, north of the equator, discovered by Stanley in 1888, in his great journey from the west to the east coast, when he rescued Emin Pasha. It is a chain of heights about 16,000 feet in elevation, is clad with snow and

traversed by large glaciers. It lies about 200 miles west of Lake Victoria and between Lake Albert and Lake Albert Edward. The river Semliki, connecting the latter two lakes, flows in a valley near the range. The snow line is about 13,000 feet above sea level. These mountains are sometimes identified with the Mountains of the Moon, spoken of by ancient writers.

RUY BLAS, rōō-ē'bläs, a drama in five acts and in verse, by Victor Hugo. It is considered one of the best of his plays, and is popular also in the adaptation *Don César de Bazan.* In *Ruy Blas,* Hugo's dramatic theory of contrast of grave and gay, rapid alternation of tragic and grotesque, is pushed to its utmost. The scene is Madrid; the time 1699. Don Salluste de Bazan, scorned by Maria de Neubourg, second wife of the king, Charles II, plots revenge. Failing to enlist the aid of his scapegrace but chivalrous cousin, Don César, he introduces his own valet, Ruy Blas, to the court as his kinsman. Ruy Blas is in love with the queen and through her sympathetic interest gains official preferment which he uses for political and fiscal reform. The long speech, 101 lines, in which he contrasts the sordid struggle for sinecures in a decaying monarchy with the glories of the reign of Charles V, ranks among the most brilliant tirades of the French drama. The queen and Ruy Blas are betrayed into a compromising situation by Don Salluste, who, when Don César threatens to balk his revenge, ruthlessly sacrifices his cousin to his injured vanity. Ruy Blas kills Don Salluste and then himself, consoled that his death has won from the queen an admission that love has overcome all prejudice of rank or station.

This play, which Hugo says he began to write on July 4, 1838, has, except for the denouement, constant and perplexing likeness to Sir Edward Bulwer-Lytton's *Lady of Lyons,* first acted Feb. 14, 1838. The idea of a valet set by a scorned lover to woo a fine lady had been turned to dramatic account in Molière's *Les Précieuses ridicules.* Hugo certainly used Henri de Latouche's *La Reine d'Espagne* (1831). In his very inaccurate *V. Hugo raconté par un temoin de sa vie,* Auguste Vacquerie notes as sources the *Memoires d'Espagne* of Madame d'Aulnoy (1690), *Solo Madrid es corte* (1675), and Vayrac's *État présent d'Espagne* (1718). How carelessly Hugo used all these is shown in detail by Alfred Morel-Fatio in his *Etudes sur l'Espagne,* vol. 1, pp. 177-244 (1888–1904).

BENJAMIN W. WELLS.

RUYSBROECK, rois'brōōk, or **RUISBROECK,** rois'brōōk, or **RUSBROEK,** rûs'brōōk, **Jan van,** Flemish mystic: b. Ruysbroeck, Flanders, 1293; d. Groenendael, Dec. 2, 1381. He was educated at Brussels for the priesthood, was ordained in 1317, and for 26 years served as a secular priest of the church of St. Gudule in Brussels. In 1343 he withdrew to the hermitage of Groenendael in the forest of Soignies. In 1349 the hermitage became an Augustinian monastery of which Ruysbroeck was prior. Here he lived a contemplative life and wrote his mystical works, the chief of which are *The Adornment of the Spiritual Marriage, The Seven Steps of the Ladder of Spiritual Love, The Mirror of Blessedness, Book of Supreme Truth.* They were written in Flemish and translations were made into Latin, German, French, Dutch, and English. A complete edition of Ruysbroeck's works was published in Bussum, Holland, in 1912.

Consult Engelhardt, M., *Richard von St. Victor und Joannes Rusbroek* (Erlangen 1838); Ullmann, K., *Reformatoren vor der Reformation* (Hamburg 1842).

RUYSBROECK, William of. See RUBRUQUIS.

RUYSDAEL, Jacob van. See RUISDAEL.

RUYTER, roi'tĕr, **Michael Adriaanzoon de,** Dutch admiral: b. Flushing, Netherlands, March 24, 1607; d. Syracuse, Italy, April 29, 1676. He early entered the navy and rose from cabin boy to captain by 1635. In 1641 he was placed as rear admiral in command of a fleet sent to the assistance of the Portuguese, who had thrown off the yoke of Spain, and he was afterward employed against the Barbary corsairs. In the war between the Dutch and English, begun in 1652, Ruyter repeatedly distinguished himself, especially in the battle fought in February 1653 near the mouth of the English Channel. In this battle Admiral Richard Blake, commanding the English, defeated Ruyter and Admiral Maarten Tromp, who commanded the Dutch.

Ruyter became vice admiral of Holland after the death of Tromp in 1653, and afterward served against the Portuguese, the Swedes, and the Turkish states of North Africa. He commanded in the great battle fought off Dunkirk in June 1666, against the English under Prince Rupert and the duke of Albemarle, in which neither side gained the victory; but in July Ruyter was defeated, and returned to Holland. In the following year he made his memorable expedition up the Thames, when he destroyed Upnor Castle and burned some ships at Sheerness. He was made admiral in chief of the Dutch fleet and commanded at the battle of Sole Bay (Southwold Bay) in 1672, against the English and French fleets under the duke of York, the earl of Sandwich, and Count d'Estrées. The Dutch were defeated, but in the following year Ruyter defeated Prince Rupert and d'Estrées off Schooneveldt. Peace was made with England, though the war with France continued. In a battle with the French fleet in the Mediterranean in April 1676, Ruyter was seriously wounded in the right leg and died a week later. His body was returned to Amsterdam for burial in the New Church there.

RUZICKA, rōō'zhĕch-kä, **Leopold,** Swiss chemist: b. Vukovar, Yugoslavia, Sept. 13, 1887. He was educated at the Technical High School in Karlsruhe, Germany, and at the University of Basel in Switzerland. In 1926 he became professor of organic chemistry at the University of Utrecht, and in 1929 professor of chemistry at the Technical High School in Zurich. His research in the chemical structure of sterols led to the discovery that the male hormones, androsterone and testosterone, could be synthetically produced from a neutral sterol such as cholesterol. In 1939 he shared the Nobel prize for chemistry with Adolph Butenandt.

RUZSKY, or **RUSSKI, Nikolai Vladimirovich,** Russian general: b. about 1854; d. 1918. He was educated at Constantine military schools

and at the Nicolas General Staff Academy, served in the Turkish War of 1877–1878, and in the Russo-Japanese War was quartermaster general. At the outbreak of World War I, Ruzsky was in command of the Russians Northern Army and conducted the brilliant military operations which led to the capture of Lemberg in September 1914, a feat for which he received honors from both England and France. He was retired because of ill health in April 1915, but resumed his command in September. He was again relieved of his command in December 1915, although he retained his position in the council of the empire and the supreme military council. He was again in command of the Northern Army in July 1916-May 1917, and was then relieved to be reinstated by Kerensky Sept. 14, 1917, as commander in chief of the Northern Army. He retired on the establishment of the Soviet Government, and was killed by the Bolshevists in 1918.

RYAN, Abram Joseph, American Roman Catholic clergyman, and poet of the Confederacy; b. Hagerstown, Md., Feb. 5, 1838; d. Louisville, Ky., April 22, 1886. He was educated for the priesthood at Niagara University, Niagara Falls, N. Y., teaching there and at the diocesan seminary at Cape Girardeau, Mo., until Sept. 1, 1862, when he joined the Confederate service as a chaplain. A deeply spiritual person, he ministered to the dying on the battlefield, and helped carry the wounded to safety until, in his own words, "The Conquered Banner was furled at Appomattox." Of his numerous poems, many of exquisite beauty, perhaps the best known are *The Conquered Banner,* written after the end of the Civil War, and *The Sword of Robert E. Lee.* Others include *The Lost Cause, Gather the Sacred Dust,* and *March of the Deathless Dead.* It was these verses that earned him the title Poet of the Confederacy. An unreconstructed rebel, Father Ryan never relented in his attitude toward the North until it joined in relief work during the cholera plague in the South in 1878. Then he wrote the poem *Reunited.* His collected poems were published in 1879 under the title *Father Ryan's Poems;* and this was followed by the book of devotions *A Crown for Our Queen* (1882).

RYAN, Edward George, Irish-American lawyer and state judge: b. Newcastle House, near Enfield, County Meath, Ireland, Nov. 13, 1810; d. Madison, Wis., Oct. 19, 1880. Emigrating to New York in 1830, he studied law and was admitted to the bar in 1836. The same year he moved to Chicago where he became editor of the *Tribune* in 1839 and was for a time prosecuting attorney for Cook County. In 1842 he moved to Racine, Wis., and six years later to Milwaukee, after having served in 1846 as a delegate to the convention that framed Wisconsin's state constitution. There he achieved distinction as a trial lawyer, especially in criminal cases. Appointed chief justice of the state's supreme court in 1874, the following year he was elected to the same office. A states' rights Democrat, he nevertheless remained inflexibly loyal to the national government during the Civil War.

RYAN, John Augustine, American sociologist and theologian: b. Vermillion, Minn., May 25, 1869; d. Saint Paul, Minn., Sept. 16, 1945. He received his education in the public schools, the College of St. Thomas, the Saint Paul Seminary, and the Catholic University of America. After ordination to the priesthood by Archbishop John Ireland on June 4, 1898, he served for a time in a rural parish and then went to the Catholic University of America for higher studies in theology and canon law, receiving the S.T.D. degree in 1906. From 1902 to 1915 he taught moral theology in the Saint Paul Seminary and from 1915 to 1939 at the Catholic University of America. After retirement from teaching, he continued his work as writer, lecturer, and official of the National Catholic Welfare Conference in Washington.

Dr. Ryan's field of activity may be described as that of social justice. His first book, a revision of his doctoral dissertation, was *A Living Wage* (1906), a pioneer work that made a deep impression both in America and abroad, and resulted in widespread legislation, some of which Dr. Ryan himself wrote, based on its principles. Among his other books are *Francisco Ferrer, Criminal Conspirator* (1910); *Socialism—Promise or Menace?* (1914; new ed. 1941), a debate with Morris Hillquit; *Distributive Justice* (1916); *Social Reconstruction* (1920); *The State and the Church* (1922), new ed. with Francis J. Boland called *Catholic Principles of Politics* (1940); *Declining Liberty and Other Papers* (1927); *The Catholic Church and the Citizen* (1928); *Questions of the Day* (1931); *A Better Economic Order* (1935); *Seven Troubled Years* (1937); and *The Norm of Morality* (1944). Dr. Ryan received many honors, among them his appointment by Pope Pius XI in 1933 as a domestic prelate with the title of Right Reverend Monsignor; an honorary doctorate from Columbia University; choice by President Franklin D. Roosevelt to give the invocation at his second inaugural; and membership in the three-man Industrial Appeals Board of the National Recovery Administration.

Monsignor Ryan was the outstanding American Catholic sociologist, and the impact of his thought is to be found in various types of social and economic legislation, the labor movement, work for international peace and understanding, racial relations, and education, especially higher studies among the Catholic clergy and laity. Certain of his views were opposed as ultraliberal and even radical, but such opposition was gradually nullified by their wide acceptance and practical success. His work is marked by depth and originality of thought, clear and vigorous expression, and command of both basic principles and factual material; his personal character by integrity and simplicity, charm of manner, deep religious belief, and a corresponding practice. Consult his autobiography *Social Justice in Action* (1941).

JOHN K. RYAN,
The Catholic University of America.

RYAN, John Dennis, American capitalist and copper miner: b. Hancock, Mich., Oct. 10, 1864; d. New York, N. Y., Feb. 11, 1933. Son of a mining expert and prospector in the Lake Superior copper district, he succeeded H. H. Rogers as president of the Amalgamated Copper Company in 1909, which soon became the Anaconda Copper Mining Company. He also organized the Montana Power Company. In May 1918, he became director of the Bureau of Aircraft Production, and three months later was assistant secretary of war and chairman of the Air-

craft Board. Despite his efforts, not one American built fighting plane reached the front in World War I. He resigned Nov. 21, 1918, to become chairman of the Anaconda's board of directors.

RYAN, Patrick John, American Roman Catholic prelate: b. Thurles, Ireland, Feb. 20, 1831; d. Philadelphia, Pa., Feb. 11, 1911. After receiving a deaconship at St. Patrick's College, in Carlow, Ireland, he emigrated to the United States and was ordained to the priesthood at St. Louis, Mo., in 1853. Appointed curate of the cathedral there, he subsequently was appointed rector of the Church of St. John the Evangelist and vicar general of the St. Louis diocese. In 1868, he accompanied Archbishop Kenrick to Rome, and in 1872 was consecrated titular bishop of Tricomia and coadjutor to Archbishop Kenrick. In 1884 he became titular archbishop of Salamis and was transferred to the metropolitan see of Philadelphia. He delivered discourses in nearly all the larger American cities, notable among these lectures being that on "Modern Skepticism." He published *What Catholics Do Not Believe,* and *The Causes of Modern Religious Skepticism.*

RYAN, Thomas Fortune, American capitalist: b. Nelson County, Va., Oct. 17, 1851; d. New York, N. Y., Nov. 23, 1928; engaged in drygoods business at Baltimore in 1868, but in 1872 went to New York and entered Wall Street, becoming a member of the stock exchange in 1874, when but 23 years old. He was connected with the consolidation of the street railways and lighting systems of New York, Chicago, and other cities; was interested in railroad and coal properties in Ohio and West Virginia. In 1905 he purchased a controlling interest in the Equitable Life Assurance Society. On his retirement in 1910 he was officer or director in more than 30 corporations. A supporter of the Democratic Party and liberal contributor to campaign funds, he served as a delegate to National Democratic conventions.

RYAZAN, rye-zän'y. See RIAZAN.

RYBINSK, city. See SHCHERBAKOV.

RYDAL, England, a picturesque village in the county of Westmoreland, two miles northwest of Ambleside. It is situated in a narrow gorge formed by the projection of two mountains near Rydal Lake. The lake, only half a mile in area, contains two beautiful islets, is encircled by meadows and dominated by rocky heights which add to the charm and calm beauty of the surroundings, so celebrated in English literature. Rydal Hall is a fine mansion in a park which contains many grand forest trees and a cascade immortalized in verse by Wordsworth, who lived for some years at Town End, nearby, as did De Quincey.

RYDBERG, rüd'bär-y, **Abraham Viktor,** Swedish writer: b. Jönköping, Dec. 18, 1828; d. Stockholm, Sept. 21, 1895. He studied at the University of Lund, and in 1854 entered journalism, contributing to the leading paper of Göteborg. In 1868 he was sent to an assembly of the church where he was the champion of liberal ideas and from 1870 to 1872 sat in the Riksdag. In 1884 he became professor of the history of civilization at Stockholm. He is the author of *The Pirate of the Baltic* (1857); *The Last of the Athenians* (1859), which has been translated into English, German and Danish; *The Teachings of the Bible about Christ* (1862); *Magic of the Middle Ages* (1864); and *Romish Legends of the Apostles Peter and Paul* (1871). His works include all studies in esthetics, philosophy, and psychology, besides poetry and a translation of Goethe's *Faust.* He is regarded as one of the foremost Swedish men of letters.

RYDE, rīd, England, municipal borough and watering place on the northeast coast of the Isle of Wight, overlooking the Spithead. Beautifully situated, it has developed from a small fishing village, at the end of the 18th century, into a popular resort. It has steamer connection with Portsmouth, 5 miles away, and other mainland ports. Pop. (1946 est.) 19,080.

RYDER, Albert Pinkham, American artist: b. New Bedford, Mass., Mar. 19, 1847; d. Elmhurst, N. Y., Mar. 28, 1917. After studying under the engraver, William E. Marshall, and at the National Academy of Design, he contributed to the academy's annual exhibitions, and from 1878 to 1887 to those of the Society of American Artists. He became an academician in 1906, but little attention was paid to his early work. Living alone (he never married) in an attic studio in New York, he lived wholly for his art, yet was no misanthrope, having many friends among fellow-artists and connoisseurs. He had the traditional improvidence and unworldliness of genius, giving away on impulse many of his finest paintings. His landscapes, in the imaginative idealistic tradition of the Hudson River school, are poetic creations of extraordinary charm, and earned him the title of "last of the romanticists." But he is most admired for his marines. He also painted an occasional still life, and symbolic pictures. Among his patrons was a group of Canadian connoisseurs, including Sir William Van Horne. His work is in the permanent collections of leading American and Canadian museums. Among the best known examples are *Temple of the Mind, The Flying Dutchman, Jonah and the Whale, The Curfew Hour, Death on a Pale Horse,* or *The Race Track,* and *Macbeth and the Witches.* See AMERICAN ART.

RYDQVIST, rĭd'qwĭst, **Johan Erik,** Swedish critic and philologist: b. Göteborg, Oct. 20, 1800; d. Stockholm, Dec. 17, 1877. After studying law and ancient languages at Uppsala from 1820 to 1826, he was appointed to the staff of the Royal Library at Stockholm, becoming chief librarian in 1843, retiring in 1865. He was elected a member of the Swedish Academy (1848) and of the Royal Academy of Sciences (1856). He translated many Greek and English works into Swedish and published numerous literary and critical essays, notably in *Heimdall,* a critical review which he edited from 1828 to 1832. His principal works include *The Chief Literary Events of Past Ages* (1828); *Ancient Nordic Drama* (1836); and *Laws of the Swedish Language* (1850–1874), an authoritative philological work.

RYE, N. Y., a city of Westchester County, on the New York, New Haven and Hartford Railroad, eight miles northeast of New Ro-

chelle. Rye was founded in 1660, and five years later was organized as a town of Connecticut, the border line not being settled until 1700. It became a city in 1942. One of Rye's interesting features is the Jay homestead. Rye Beach on Long Island Sound, with its picturesque colony of bungalows, cottages and shacks, is a favorite summer resort for bathing, boating and other recreations. Pop. (1940) 9,865; (1950) 11,721.

RYE (*Secale cereale*), a plant of the grass family, and allied to wheat, yielding one of the most important cereal crops in the United States. It is an erect hardy annual, with slender stiff culms from four to six feet high, flat leaves, and a terminal, compact, somewhat flattened, bearded spike from four to six inches long. The spikelets are usually two-flowered, sessile, compressed, alternate, convex on one side and flat on that next the rachis. The outer glume is keeled and often carries a short awn, while the flowering glume carries a long awn. Each floret has three stamens and two very short styles. The grain is oblong, furrowed on the inside, hairy at the apex and generally free from the flowering glume and palea. The plant is not found wild, but is believed to be indigenous to the country bordering the Black and the Caspian seas. The granules of rye-starch are larger than those of wheat or barley, some being .0016 of an inch in diameter. The form of the larger ones is that of a flattened disc with a depressed center having cracks on its outer edge. The hilum is central with lines radiating almost to the circumference.

Soviet Russia continues the chief rye producing country, although since World War II much rye acreage has been shifted to wheat. Production in the United States has declined for several years, that of 1951 amounting to 21.4 million bushels; in the same year Canada harvested about 18 million. The world crop in 1951–1952 was 1,680 million bushels.

Rye is hardier than wheat and is usually cultivated in cool regions, on sandy or light soils, and in the Eastern states on medium loams which have become physically or chemically defective and will not produce satisfactory wheat crops. It will thrive on reclaimed peaty soils. In rotation, rye occupies the same place that wheat would, and, like the latter, prefers a fine firm seed bed. For a grain crop, from one and one-quarter to two bushels per acre are usually sown in the autumn. Judicious rolling and harrowing in spring is often beneficial. The crop is harvested just before it is fully ripe, a good yield varying between 15 and 30 bushels of grain and from one to two tons of straw. The straw is particularly tough and pithy and of little feeding value. It takes a long time to rot in the manure heap when used as litter, unless it is chaffed.

Two types of rye are grown, the common or autumn-sown usually grown for grain, and the spring-sown usually sown in spring, but the former may be sown in spring and the latter in autumn. Midsummer or St. John's Day rye and giant or Tyrolese rye are spring varieties and good for forage, the latter requiring a rich soil. When grown for forage, as a cover crop, or to be plowed in as green manure, three bushels of rye may be sown per acre at various seasons of the year, the only proviso being that there shall be sufficient moisture and warmth present to insure germination and growth. Green rye is an excellent feed, either for soiling or folding in the spring, being well suited for cows in milk or ewes with lambs. As soon as the ear appears the straw becomes tough and woody, so that stock refuse it, hence it should be grown in small areas and a succession put in. A bushel weighs about 56 pounds and each pound contains on an average about 21,000 kernels.

Feeding Value and Uses.—In northern Europe the grain is largely used for breadmaking, but in this country it is chiefly employed either in the manufacture of malt and spirituous liquors, as rye whiskey, etc., or as food for stock. Holland's gin and the national Russian drink, kvass, are largely made from rye. The following table shows that rye does not differ materially from wheat in composition, nor are its by-products chemically dissimilar from those of the wheat grain:

Average percentage composition of	Water	Ash	Protein	Crude fiber	Nitrogen-free extract	Ether extract
Rye	11.6	1.9	10.6	1.7	72.5	1.7
Rye flour	13.1	0.7	6.7	0.4	78.3	0.8
Rye bran	11.6	3.6	14.7	3.5	63.8	2.8
Rye shorts	9.3	5.9	18.0	5.1	59.9	2.8

The percentage digestibility of rye meal with ruminants is: dry matter 87, protein 84, nitrogen-free extract 92, ether extract 64; while that of rye bran with pigs is: dry matter, 67, protein, 66, nitrogen-free extract 75, ether extract 58.

In milling the outer portion of the rye kernel constitutes the bran, the second layer the "middlings" or "shorts," and the inner portion the flour. For stock the whole kernel is ground. Rye flour is somewhat similar to corn meal as a source of protein and energy, but is more expensive. Ground rye and rye bran are fed to cows in Denmark. Not more than three pounds daily should be given, as they are said to have a deleterious effect upon the quality of the butter. Experiments show that for pig feeding rye is of equal value with barley, and that one pound of rye is equal to six pounds of separated milk or 12 pounds of whey; that rye shorts are inferior to rye, the pork from the former being softer and showing more shrinkage. Ground rye may be safely fed to work horses to the extent of eight or 10 pounds daily, together with other feeds, as bran or oats. Owing to the hollow stems of rye holding considerable air, this crop is not making much progress for silage purposes.

Rye straw is longer and more uniform in size than that of other grains and when unbroken it is used for packing pottery, horse collars, mattresses, etc., and in the manufacture of a variety of articles, as paper, hats, bonnets, mats, slippers, toys and fancy articles. For such purposes it often commands a good price.

Diseases.—Ergot (*Claviceps purpura*) is the chief disease and is common on other gramineae. The elongated, curved, brownish or purplish spurs of ergot form on the head in place of a kernel and are sown with the seed unless it is carefully screened. If sown, they germinate and finally send out minute spores which, attaching themselves to the grass, live on it parasitically, send out small threadlike growths which finally reach the ovary, where they displace the rye grain and reproduce the cockspur or resting spore. A cautionary word—ergot should be

removed before rye is used as feed; it is dangerous to both man and beast. See also ERGOT; ERGOTISM.

SAMUEL FRASER,
Instructor in Agronomy, Cornell University.

RYE GRASS. See GRASSES.

RYE HOUSE PLOT, in English history, a conspiracy which took place in the reign of Charles II, and which became famous from the fact that its detection involved the death of Lord William Russell, Arthur Capel, the 1st earl of Essex, and Algernon Sidney (qq.v.) who were in no way connected with it. The immediate object of the Rye House Plot, which was contrived in 1683 among a number of obscure persons belonging to the party of which those celebrated men were among the leaders, was to assassinate the king and his brother, the duke of York (afterward James II), as they returned from the Newmarket races. This plan was to have been executed at a convenient spot on the road from Newmarket to London, where there was a farm called Rye House, belonging to one of the conspirators named Rumbold; but the plan was frustrated by the king and his brother who returned from Newmarket earlier than was expected. Soon after, information of the matter was laid before one of the secretaries of state, and it was added that since this plot had been frustrated the plan for a general insurrection had been taken up by various eminent persons, among whom were those mentioned. A general insurrection had indeed been talked of, and the details and probable success of such a scheme appear to have been considered by the accused persons; but there was no evidence to show that the promoters of the wider scheme were involved in the minor plot, which was engineered, after the general insurrection had first been talked of, by a few of those already concerned in the larger plan. Yet from the way in which the revelations were made to the government the two schemes were completely confounded, and Russell, Essex, and Sidney were arrested on the charge of treason. Essex put an end to his own life in the Tower, and Russell and Sidney were condemned and beheaded. Lieutenant Colonel Walcot, one of the real contrivers of the Rye House Plot, was at the same time brought to the block.

RYERSON, rī'ĕr-s'n, **Adolphus Egerton,** Canadian clergyman: b. Charlotteville, N. Y., March 24, 1803; d. Toronto, Ontario, Feb. 19, 1882. He entered the Methodist ministry in 1825, and served on the Niagara circuit until 1828, when he helped organize the Methodist Episcopal Church of Canada. In 1832 he visited England to establish a connection between the new church and the parent body. He was a founder of Victoria College, Cobourg, Ontario, and became its first president in 1841. From 1844 until 1876 he served as superintendent of public schools for Upper Canada; he resisted the efforts of the Anglicans to control university training and to restrict the benefits of public endowments to a single church. In 1829 he helped found the *Christian Guardian,* journal of the Methodists, and was its first editor.

RYKOV, rĭ'kôf, **Aleksei Ivanovich,** Russian politician: b. Saratov, 1881; d. Moscow, March 14, 1938. The son of a peasant, he was educated at the University of Kazan, in which city he met many exiled revolutionaries. He was arrested in 1902 for helping to organize a May Day demonstration, but managed to escape, and in 1905 joined the Bolsheviks. During the remaining years of the czarist regime he was again arrested and imprisoned on several occasions, and at the time of the October Revolution in 1917 he was in exile in the Narym district. He became an active collaborator of Nikolai Lenin (q.v.) when the Communists achieved power, heading the Commissariat of the Interior, serving as president of the Supreme Economic Council, and holding several other offices. After the death of Lenin in 1924 he aligned himself with Joseph Stalin (q.v.) in opposition to Leon Trotsky (q.v.), the latter's rival for power, and for six years served as president of the Soviet of People's Commissars. However, he was frequently in conflict with Stalin over policy and as a result was dismissed from office, but was reinstated in 1931 after publicly recanting his opposition. His influence and standing in the party gone, in 1936 he was arrested on a charge of plotting to assassinate Stalin. Together with other former leaders he was brought to trial for treason early in 1938, and publicly confessed to having taken part for a long period in plots against the Stalinist government which Trotsky had inspired. He was executed.

RYLAND, Henry, English painter: b. Biggleswade, Bedfordshire; d. Nov. 23, 1924. He worked in Paris in the studio of Benjamin Constant, and at the Julien Academy under Gustave R. C. Boulanger and Jules L. Lefebvre. His professional life began as a designer of stained glass, and he contributed to the *English Illustrated Magazine* in its early days. Subsequently, however, he became well known for his water colors. His first work as a painter was exhibited at the Grosvenor Gallery, and he afterwards exhibited at other galleries in London. Many of his pictures have been engraved.

RYLANDS, John, English textile manufacturer: b. St. Helens, Lancashire, Feb. 7, 1801; d. Stretford, Lancashire, Dec. 11, 1888. With his father and elder brothers, in 1819 he established at Wigan the cotton textile manufacturing firm of Rylands and Sons. Dye and bleach works and spinning mills were subsequently acquired, and in 1847 he became head of the firm. He was one of the promoters of the Manchester ship canal. His wife founded the John Rylands library, at Manchester.

RYMER, Thomas, English critic and antiquary: b. Yafforth, Yorkshire, 1641; d. London, Dec. 16, 1713. He studied at Cambridge, subsequently kept terms at Gray's Inn, and was called to the bar in 1673. In 1678 he published *Edgar, or the English Monarch,* a play in rhymed verse. Criticism of the drama was his chief interest, and his principal works in this connection were *The Tragedies of the Last Age Considered* (1678), unfavorable to the plays of Beaumont and Fletcher (q.v.), and *A Short View of Tragedy* (1692), which condemned William Shakespeare's *Othello* as "a bloody farce without salt or savour." Appointed historiographer royal in 1692, he was entrusted with the preparation of a collection of public treaties, which he began to publish in 1704, under the title of *Foedera, Conventiones, et cujuscunque Generis Acta publica, inter*

Reges Angliae et alois Principes. Of this valuable and learned work he completed 15 volumes, and five more were afterward added by Robert Sanderson. The publication of the whole work was completed in 1735.

RYMER, Thomas, of Ercildoune. See RHYMER, THOMAS THE.

RYSWICK, rĭz'wĭk, or **RIJSWIJK,** rīs'wĭk, Netherlands, a village between Delft and The Hague, famous for the celebrated Treaty of Ryswick, concluded there in September and October 1697 between France, England, Spain, Holland, and the Holy Roman Empire. It terminated the bloody nine years' War of the Grand Alliance against France. Louis XIV relinquished his recent conquests except Strassburg (Strasbourg), which had been taken in 1681; he abandoned Lorraine and Luxembourg, acknowledged the independence of Holland, repudiated the Stuarts, and recognized the Protestant succession in England (William III).

RYTI, rü'tĭ, Rĭsto, Finnish statesman: b. Huittinen, Feb. 3, 1889. He graduated in law at Helsingfors (Helsinki) University in 1909, and until World War I he practiced his profession, first at Rauma and, after 1914, in Helsinki. In 1919 he entered the legislature of the newly constituted republic of Finland; as minister of finance, 1921–1924, he visited the United States to conclude the Finnish debt agreement. After returning to Helsinki in 1923 he was also appointed governor of the Bank of Finland. He was Finland's delegate to the League of Nations in 1932, and vice chairman of the country's delegation to the World Economic Conference in London the next year. On Dec. 1, 1939, the day after Finland became involved in war with Russia, he was made prime minister. He was opposed to the peace made with Russia on March 7, 1940. In November he became acting president of the republic in succession to Kyösti Kallio, who had resigned; the latter shortly died, and on Dec. 22, 1940, Ryti became Finland's fifth president. When German armies invaded Russia on June 22, 1941, he took his country into war again with the Soviet Union. On June 25, 1944, he pledged not to make peace, in what had become a disastrous war for Finland, without Germany's consent; but defeat could not be staved off, and on August 1 he resigned the presidency in favor of Field Marshal Carl G. E. von Mannerheim. With other leaders, he was subsequently brought to trial in Helsinki for leading Finland into World War II on the side of Germany; convicted on Feb. 21, 1946, he was condemned to imprisonment for 10 years, receiving the heaviest sentence of all those accused. On May 19, 1949, he was pardoned by President Juho Paasikivi.

RYUKYU, r'yōō'kyōō, **ISLANDS,** (Jap. NANSEI SHOTO), an archipelago in the Pacific Ocean, until World War II an integral part of the Japanese Empire, known also as the Liukiu, or Luchu, Islands. The islands, some 60 in number, extend in an almost uninterrupted chain southward from Kyushu nearly to Formosa (Taiwan); the total area is 1,844 square miles, and the population in 1940 numbered 840,379. From northeast to southwest, the archipelago is divided into five lesser groups: Osumi Gunto, Tokara Gunto, Amami Gunto, Okinawa Gunto, and Sakishima Gunto. The first three of these groups are officially combined under the name Satsunan Shoto by the Japanese; and Amami Gunto and Okinawa Gunto comprise the Ryukyu Retto on Japanese sources. Thus Ryukyu Retto and Ryukyu Islands, which are simply Japanese and English forms of the same name, are applied to two different entities; frequently this has been a source of much confusion. Okinawa (q.v.), or Okinawa Shima, principal island of the group named Okinawa Gunto, is by far the most densely populated of the islands; situated about 370 miles from Kyushu and 825 miles from Tokyo, it is 70 miles long and averages about 7 miles in width. Naha, or Nawa, on the southwest coast, a city with 66,000 inhabitants, is the capital of the Ryukyu prefecture; a railroad links it with Yonabaru, a naval base on Nakagusuku Bay, on the southeast coast. The mountainous northeastern part of Okinawa is sparsely populated; elsewhere, on rolling open hills are numerous small farms where rice, sugar, wheat, sago, and potatoes are cultivated. Fine lacquer ware is also manufactured, and saki, an alcoholic drink, is made from rice; the fisheries are of importance. Okinawa was visited in 1853 by Commodore Matthew Calbraith Perry (q.v.), who purchased a plot of ground near Tumai as an American cemetery in perpetuity.

The Ryukyus became subject to China in the 14th century, and in 1609 they were conquered by the Japanese prince of Satsuma. Thereafter the local rulers paid tribute to both China and Japan until 1879, when the Japanese organized the archipelago as a prefecture; this status was recognized by China in 1895, following the Sino-Japanese War.

Okinawa had been heavily fortified by Japan prior to World War II, and on April 1, 1945, following a long bombardment, the island was invaded by troops of the United States Tenth Army led by Lieut. Gen. Simon Bolivar Buckner, Jr. (q.v.). The campaign that ensued was the most arduous in the war in the Pacific down to that time. Before organized resistance ceased on June 21, 82 days later, General Buckner had been killed, as well as Ernie Pyle, popular newspaper correspondent, who met his death in an assault on Ie, a small island off the northwest coast of Okinawa. Total American casualties were 46,319 (11,897 killed and 34,422 wounded); the Japanese lost 101,853 killed (including Lieut. Gen. Mitsuru Ushijima, commanding on Okinawa) and 9,498 taken prsoner, a total of 111,351 men. Most of the other islands of the Ryukyu group remained in Japanese possession until the war's end. Documents surrendering them unconditionally were signed on Okinawa on Sept. 7, 1945, the Allied powers at the surrender ceremony being represented by Gen. Joseph Warren Stilwell (q.v.); the Japanese Army and Navy, whose forces in the archipelago at that time numbered 105,000 officers and men, were represented at the signing by Lieut. Gen. Toshiro Nomi.

RZHEV, rzhĕf, USSR, a city of the Kalinin Region, RSFSR, situated on both banks of the Volga River, 135 miles northwest of Moscow and 90 miles southwest of Kalinin (Tver). There is a considerable transit trade at Rzhev, carried on the Volga and the four railroad lines which enter the city. Industries include shipbuilding and manufactures of paper, leather, textiles, machinery, and matches. Rzhev, which dates from the 11th century, formed part of the principality of Smolensk. Pop. (1939) 54,081.

S the nineteenth letter and fifteenth consonant of the English and several other alphabets, is classed as a sibilant or hissing letter. The sibilant is produced by emission of the breath while the end of the tongue is brought close to the front palate just behind the gums; this is the hard open sound; the corresponding soft open sound is represented in the alphabet by *z*, but in practice is often represented by *s*. The form S is the Semitic *shin*, and the ancient Greek character ς (sigma) with its angles rounded; in the existing Greek alphabet the s is represented by Σ. In some English words s is silent: island, aisle. The final *th* of verbs has changed to *s* because of the nearness of sound of *s* to *th: loveth, loves; hath, has.* There are several words in English — and the like can be said of Greek — which, beginning with *m* or *p* or *l*, take on an initial *s; melt, smelt; pike, spike; lick, slick;* Gr. *mikros, smikros.* Compare Ger. *niesen;* Eng. *sneeze.* The palatalization which is so characteristic of English and the romance languages has had the effect of generally giving to *c* or *sc* before *e, i* or *y* the sound of *s*. Sometimes the sound of *s* is changed to that of *st*; the verb *hoise* becomes *hoist, whiles* becomes *whilst*; and there is the mispronunciation of *once, onst*; and the plural of *mouse* is *mice.* The digraph *sh* stands usually for the ancient sc (sk): Old Eng. *sceal,* shall, fisc, fish. It is pronounced with the edges of the tongue appressed to the teeth, but with the centre free; *s* alone represents this sound in *sure, sugar, issue,* etc. This sound is a surd; *s* represents its sonant *in osier, measure,* etc.: *sh* is replaced by *ch* in *machine; ci* in *social; sci* in *conscience; ti* in *martial,* all of which words are of Latin or French extraction. S stands for *south, second, sulphur, shilling,* and in combinations for science or society. SS. stands for steamship. See ALPHABET.

S. P. Q. R., the initial letters of Senatus Populusque Romanus (the Senate and the Roman people), which expressed the political character of the Latin nation. These initials were carried as a battle standard by the Roman armies.

SS., commonly used at the head of affidavits and other legal documents, follows the brace which includes the state and county names where the paper is witnessed or the action at law laid. On legal documents SS. or ss. (scilicet), it is said, signifies "to wit," "namely."

"SS" is also "a symbol of unknown antiquity worn on the collars of the superior judges and lord mayors of England; formerly by persons attached to the royal household and others. It was assumed by certain classes, never bestowed and had no connection with heraldry." — Storemouth.

From being an ornament of royalty, supposed originally to signify "sovereignty," it became the badge of followers of the house of Lancaster and passed unofficially to persons in authority, like magistrates, mayors and justices; and from being used upon the collar came to be used on official writings to indicate the authority of the magistrate, mayor or judge who gave the same.

The mysterious "ss" is then, we may conclude, a symbol of official position. Whatever the origin of the symbol, the "esses" is an ornament, passed into a sign of judicial or magisterial authority, and as such follows the name of the State or county where a document is witnessed or an action at law is laid.

SA DE MIRANDA, Francisco de, frän-thēs'kō dā sä dā mē-rän'dä, Portuguese poet: b. Coimbra, Portugal, 27 Oct. 1485; d. there, 15 March 1558. He wrote much in Spanish, taking for his models Dante and Petrarch, but in sentiment remained entirely loyal to his native country. His fame rests chiefly upon his poetical epistles and eclogues, though his entire work is excellent and characterized by sincerity and love of natural beauty. He is ranked as one of the six greatest Portuguese poets. An edition of his work edited by Caroline Michaëlis de Vasconcellos contains 189 of his pieces, 74 of which are in Castilian.

SAADJA GAON, sä-äd'yä gā-ōn' (SAADJA BEN JOSEPH, Arab SAID), Jewish Rabbin: b. Fayum, the Biblical Pithom, Egypt, 892; d. Babylonia 941. In 828 he was appointed Gaon or principal of the Jewish Academy at Sura, near Babylon, into which dwindling institution his zeal and learning infused new life. His acquirements were many and varied, living in a time when philosophy and reason were in danger of usurping the authority hitherto wielded by tradition, to which end the Karaites particularly contributed. It was the work of Saadja to discover a common ground for the maintenance of Jewish dogma side by side with philosophical theory. This was the object of his great work, written in Arabic, 'Emunot w'deot' ('Faith and Ethics') which was translated into Hebrew by Juda ibn Tibbon (1160) and into German by Fürst (1845). Saadja wrote a commentary on some of the books of the Old Testament, treatises on grammar and hymns for the synagogue. On the 1000th anniversary of his birth a complete edition of his works was published by Joseph Derenbourg. Consult Grätz, 'Geschichte der Jüden' (1870); Guttmann, 'Die Religionsphilosophie des Saadja' (1882).

SAALE, zä'lĕ, two rivers, Germany. The Saxonian Saale rises in the Fichtelgebirge in northeast Bavaria, and flows north for 265 miles into the Elbe, through East Germany. It has dams with large reservoirs, and is navigable for the last 100 miles from Naumburg. The Franconian Saale rises on the Bavarian-Thuringian border and flows southwest for 84 miles to join the Main River at Gemünden in West Germany.

SAAR, zär, or **SAAR TERRITORY** (Fr. SARRE), a district on the Franco-German border southeast of and adjoining Luxembourg, linked to France since World War II by an economic and customs union, and to Germany by the fact that the inhabitants are racially as well as linguistically Germans. With an area of 991 square miles, and having 987,650 inhabitants (Jan. 1, 1955), it has a population density of nearly 1,000 per square mile. The Saar River, rising in France in the lower Vosges Mountains and passing the French towns of Sarrebourg and Sarre-Union, at a short distance north of Sarreguemines, forms a sector of the border line between the Saar and France's Moselle Department. The river then traverses the Saar Territory and flows past the territorial capital, Saarbrücken, also Völklingen, Saarlouis, and Merzig; emerging into Germany's Rheinland-Pfalz, it debouches in the Mosel (Moselle). The topographic designation "Saar (Sarre) Basin" is often used as a synonym for the territory.

Economy.—The richness of its coal deposits and the productivity of its iron and steel works have combined to make the Saar one of the most important mining-metallurgical centers of Europe. The resources of the Saar are of major importance to both German and French economies. The Saar's coal is essential to the economic working of Lorraine's iron and steel works, while the Saar's own iron and steel plants must utilize the minette iron ore of Lorraine, the territory lacking any ore deposits of its own. In metric tons the 1954 coal production was 16,800,000; raw steel, 2,800,000; pig iron, 2,600,000. Of the Saar's 315,700 workers some 66,400, or 22 per cent, were employed in the mines.

History.—Ceded by France to Germany in 1815, the Saar Territory was artificially constituted in 1919, after Germany's defeat in World War I, from portions of Rhenish Prussia and the Bavarian Palatinate. According to the terms of the Versailles Treaty (Art. 49, *et seq.*) the "Saar Basin" was placed provisionally under a special regime instituted by the League of Nations with the economic object of giving to France its coal production for a term of years in compensation for Germany's deliberate destruction of French coal mines in occupied Nord and Pas-de-Calais. At the close of an agreed 15-year period, in 1935, a plebiscite was held. The inhabitants by a large majority elected to return to German rule. Germany thereupon entered into possession and repurchased the mines from France. After World War II the territory again came under French rule. The French encouraged an autonomy movement and gave their blessings to a constitution, adopted in 1947, which established an elective government with power over internal affairs. On Oct. 23, 1954, an agreement was signed by France and the German Federal Republic providing for continuance of the economic and customs union with France, and for internal autonomy. This was supplemented by a Franco-Saar protocol of March 21, 1955, recording agreement on various points. Saar elections for a new parliament were held Dec. 18, 1955. Although pro-Germans captured 33 out of the 50 seats, they lacked the 75 per cent majority needed to unite the Saar with the German Federal Republic and left the Saar independent, though with expectation of eventual union with Germany.

SAARBRUCKEN, zär-brük'ĕn, city, Saar, of which it is the capital, on the Saar River at the mouth of the Sulz River, 100 miles southwest of Frankfurt am Main. Across the river is Forbach, France. It is a rail center in a large industrial and coal-mining region, and its manufactures include steel products, machinery, clothing, food processing, and many others. There is an airport. It became the capital of the Saar in 1919, after a history in which it changed hands between French and Germans many times. Some of its historic buildings were destroyed in World War II, and it was captured by United States troops in March 1945. Pop. (1955) 119,388.

SAARINEN, sä'rĭ-nĕn **(Gottlieb) Eliel**, Finnish architect: b. Helsingfors (now Helsinki), Finland, Aug. 20, 1873; d. Bloomfield Hills, Mich., July 1, 1950. Educated at the Institute Polytechnic in Helsinki, Saarinen won many prizes for his city plans and architectural designs before going to the United States in 1923. With his partners Armas Lindgren and Herman Gesellius, he designed the Finnish Pavilion at the Paris Exposition of 1900, the national museum at Helsinki, and, after setting up for himself, the League of Nations building in Geneva. His skyscraper designs greatly influenced American architects, based as they were on sound engineering free from ornamentation. In Detroit he was head of the architectural department of the Cranbrook Foundation, and designed many of the buildings for Cranbrook School and Cranbrook Academy. Other designs were halls for the Berkshire music festival at Stockbridge, Mass., a design for an addition to the Smithsonian Institution in Washington, D.C., for which he received the highest award of the American Institute of Architects, and uncompleted plans for improving Chicago and Detroit. He wrote *The City: Its Growth, Its Decay, Its Future* (1943) and *Search for Form* (1948). His son, EERO SAARINEN (b. 1910), also an architect, who worked with his father, has won many prizes in competitions, and designed schools and housing centers. His most notable achievement has been the auditorium for the Massachusetts Institute of Technology (1953).

SAAVEDRA LAMAS, sä'ä-vā'thrä lä'mäs, **Carlos**, Argentine lawyer, diplomat, and statesman: b. Buenos Aires, Argentina, Nov. 1, 1878. He became professor of international law at the University of Buenos Aires, where he had been a student. In 1928 he presided over the 11th International Labor Conference in Geneva. Elected to the Chamber of Deputies, he became Argentine foreign minister (1932–1938), when he drafted an antiwar pact which was signed by 13 American republics, including the United States. While presiding over the Chaco Peace Conference (1935) he helped to end the war between Bolivia and Paraguay, and was awarded the Nobel Peace Prize in 1936. In that year he presided over the Assembly of the League of Nations. He was

president of the University of Buenos Aires (1941–1943) and professor of labor legislation (1943–1946). He has written several books on law and the way to preserve peace.

SABA, sä'bä, island, Netherlands Antilles, one of the Leeward Islands, 5 square miles in area, 30 miles northwest of St. Kitts. It consists entirely of an extinct volcanic cone, 2,900 feet high. The capital, called The Bottom, is in the crater of the volcano, about 700 feet above sea level. Two landing bays—the Fort Bay and the Ladder Bay—the latter having 530 steps leading up to The Bottom, are used by the fishermen, who carry on the chief industry and grow some agricultural products. The trade is mainly with Curaçao. There are four schools, but education is not compulsory. An administrator assisted by two deputies is head of the island, responsible to the central government in Curaçao. The three islands of St. Martin, St. Eustatius, and Saba have a council of 15 members, 5 to each. Pop. (1951) 1,098.

SABAC, shä'bäts, town, Yugoslavia, on the Sava River, 40 miles west of Belgrade on the Yugoslav State Railways. It is a busy river port and the trade center of the region between the Sava and Drina rivers. Plums, honey, livestock, and fish are the chief products. Founded by the Turks in the 15th century, it was later part of the kingdom of Serbia until 1918; was occupied by the Germans in World War II, and became part of the Serbian People's Republic of Yugoslavia in 1946. Pop. (1948) 18,238.

SABADELL, sä-vä-thĕl', city, Spain, in Barcelona Province, Catalonia, 12 miles northwest of Barcelona on the electrified section of the Spanish National Railways from Barcelona to Manresa. The textile industry is the chief occupation, but many manufactures are carried on, including diesel engines, tools, leather goods, paper, soap, and liqueurs. Wheat and grapes are grown in the district. The town dates from the 13th century. Pop. (1949 est.) 59,835.

SABADILLA, săb-ă-dĭl'ă (Sp. *cebadilla*), a Mexican plant; also the pharmaceutical term for seeds of the liliaceous plant *Schoenocaulon officinalis* which has a bulbous root, grasslike leaves, and a flower stalk some six feet in height. The papery, tricapsular fruits contain a few pointed, wrinkled, blackish seeds, acrid and causing sneezing, a powerful irritant, and poisonous. They are used to make veratrine, which, as a tincture or ointment, is used as an external application for neuralgia and rheumatism. Its chief use is for killing vermin.

SABAEANS, să-bē'ănz (Arab. *Saba'*), one of the three major peoples who played an important role in the history of ancient South Arabia, the other two being the Minaeans and the Himyarites.

The Sabaeans were the first South Arabian people to step within the threshold of civilization. They are the Sheba of the Old Testament (Gen. 10:7; 25:3) and the Sab'ai of the 8th century cuneiform inscriptions of Mesopotamia. The earliest Western reference to them occurs in Greek of the second half of the 3d century B.C. Their habitat was the southwestern corner of the Arabian peninsula, now called Yemen. The fertility of this rain-favored land, its proximity to the sea and its strategic location on the route to India gave it decided advantages over Hejaz in the north and made it the seat of a flourishing culture long before the rise of Islam.

Until the last quarter of the 19th century our firsthand knowledge of this South Arabian civilization was fragmentary and meager. Islam did not encourage its study or any pre-Islamic study. Explorations were forbidden. A Danish scholar and traveler, Carsten Niebuhr, was the first to announce (1772) the existence of South Arabic inscriptions. A French Jew, Joseph Halévy, was the first European to penetrate into inner Yemen (1869–1870). Disguised as a rabbi from Jerusalem seeking alms for the Jews he brought back 685 inscriptions from 37 different localities. He was followed by Eduard Glaser, whose explorations between 1882 and 1894 yielded some 2,000 inscriptions extending as far back as the 7th century B.C. The inscriptions are written in alphabetic characters, somewhat related to Phoenician, and reveal a long period of development. The decipherment of South Arabic, a sister of North Arabic in which the Koran is written, gave the world the first opportunity to hear what the Sabaeans and other South Arabians had to say about themselves.

As revealed by inscriptions, classical writings, and recent excavations, the last of which was by an American (1950–1952), the South Arabians achieved a high degree of civilization and prosperity based upon agriculture and trade. Their religion was in essence a planetary astral system in which the cult of the moon god, known to the Sabaeans as Almaqah (health giving), prevailed. During at least the last millennium before Christ and two centuries after Christ, they almost monopolized the international trade of the Red Sea and the Indian Ocean, as well as the land trade that took frankincense, myrrh, spices, condiments, and other tropical products through Arabia into the Mediterranean port. Some of these products came from India or East Africa. Incense was highly prized for ritual use and for Egyptian mummification. In their heyday the Sabaeans had colonies or trading posts all the way through North Arabia, from one of which the Queen of Sheba—if historical—must have come. She is named Bilqīs in Moslem tradition.

By the mid-8th century B.C., the Sabaeans had established a kingdom of their own with Ma'rib for capital. The kingdom lasted until about 115 B.C. In the first period ending about 450 B.C. a priest-king, bearing the title Mukarrib Saba, stood at the head of the state. In the second period the ruler appears shorn of his priestly character and bearing the title Malk (king of) Saba.

The capital Ma'rib lies about 60 miles east of the present capital of Yemen, San'a, and rises 3,900 feet above the sea. It has been visited by only a few Europeans. Its historical fame rests on its dam (*sadd*), a remarkable engineering feat intended to create an artificial reservoir between hills for the irrigation of neighboring lands. The older portions of the dam were constructed in the mid-7th century B.C. by Sumhu'alay Yanūf and his son Yatha'amar Bayyin.

Arab historians ascribe the entire decay of South Arabian civilization to the "bursting of the great dam" shortly before the rise of Islam. In fact, the decay was due to a variety of economic and political causes, one of which was the entry of Roman-Egyptian shipping into the Indian Ocean and the shift in the trade routes.

PHILIP K. HITTI.

SABATIER, sà-bà-tyā′, **Paul,** French chemist: b. Carcassone, France, Nov. 5, 1854; d. Toulouse, Aug. 14, 1941. He began his research work as assistant to Marcelin Berthelot, then became a member of the faculty of Nîmes University (1877), and was professor at Bordeaux (1880–1882). He then went to Toulouse as professor of chemistry, and became dean of its science faculty in 1905. With Victor Grignard, he was awarded the Nobel Prize in chemistry (1912). He was known for his method of hydrogenating organic compounds in the presence of finely divided metals, and research that paved the way for the discovery of synthetic gasoline. He wrote *La catalyse en chimie organique* (1913).

SABATIER, Paul, French historian and Protestant clergyman: b. St. Michel-de-Chabrillanoux, France, Aug. 3, 1858; d. Strasbourg, March 5, 1928. Sabatier was educated at the Faculty of Theology in Paris, and in 1885 became vicar of the French parish of St. Nicholas in Strasbourg. The German government offered him a superior appointment if he would become a German citizen; he asked to be allowed to retain his post as vicar, but the request was considered a political matter, and he was banished from the country. For a brief time he was pastor of St.-Cierge-la-Serre; then he withdrew from the ministry to devote himself to historical studies.

His chief work was *Vie de Saint François d'Assise* (1893), based largely on previously unutilized documents discovered by him in various Italian archives. He published also *La didachê ou l'enseignement des douze apôtres* (1885), and edited the *Speculum perfectionis,* attributed to Leo of Assisi (1898), and *Tractatus de Indulgentia S. Mariae de Portiuncula,* collected by Franciscus Bartholus (1900).

SABATINI, sä-bä-tē′nē, **Rafael,** Anglo-Italian author: b. Jesi, Italy, April 29, 1875; d. Adelboden, Switzerland, Feb. 13, 1950. The son of an Italian tenor and an English soprano, young Sabatini was educated in Switzerland and Portugal. At 17 he could read and write six languages, an accomplishment that encouraged him to begin a business career in Liverpool, England. After 10 years of writing commercial correspondence to foreign firms, he began to write short stories. In 1904 he wrote his first novel, *The Tavern Knight.*

Often called "the modern Dumas," he was the author of over 40 historical novels, biographies, and plays. His best-known novels were *Captain Blood* (1922), *The Sea Hawk* (1915), and *Scaramouche* (1921), all produced on the screen.

In addition to the books mentioned, he wrote *The Trampling of the Lilies* (1906); *The Life of Cesare Borgia* (1912); *The Gates of Doom* (1914); *The Snare* (1917); *The Historical Nights Entertainment* (1918); *Fortune's Fool* (1923); *The Chronicles of Captain Blood* (1931); *Scaramouche the King Maker* (1931); *Chivalry* (1935); *The Fortunes of Captain Blood* (1936); *The Sword of Islam* (1938); *Columbus* (1942); *The Gamester* (1949); and many others.

SABBATAI ZEBI or **ZEVI,** sä-bät′ä-ī tsĕ-vē′ (also SHABBETHAI), Hebrew mystic: b. Smyrna 1626; d. 1676. He was a man of great learning and magnetic presence, and he led thousands of followers, mainly in Smyrna, Salonika, Alexandria, and Jerusalem, to believe in him as the Messiah. In 1664 he had about 80,000 followers. In the following year the beginning of the Messianic reign within a few months, and the rebuilding of the temple in the next year were proclaimed in the streets of Alexandria by Sabbatai and six disciples, clad in white raiments, with garlands on their heads. Having excited serious alarm at Constantinople, he was apprehended at Smyrna, and terrified into a recantation of his mission. He was said to have declared that his sole object had been to embrace Islam and to carry over all the Jews with him. The sultan declared himself satisfied and honored him with the title of an effendi, giving him an honorary post at the same time. He again aroused the jealousy of the Turks and was either poisoned in prison or publicly executed.

SABBATARIAN CONTROVERSY, the dispute in various forms between those who urge and those who oppose a rigid observance of Sunday. It has been going on from the time of King James I, of England, who favored Sunday sports, and thereby offended many of his subjects, and it has in late years included proposals to throw open to the public museums, libraries and galleries and other places of recreation and instruction, on the first day of the week. Most of these changes have been generally adopted.

SABBATH, the ancient Hebrews' weekly day of rest. In Hebrew the word means to cease, and the expression of Josephus (Apion 2:2), who explains it as meaning "a rest from all labor," is rather to be looked upon as a commentary than as a derivation etymologically correct.

The Sabbath was the seventh day of the Hebrew week and lasted from sunset on Friday to sunset on Saturday. It was celebrated as a holy day; a day of rest and rejoicing; by ceasing from all labor, and by causing servants, strangers and cattle to cease also. Plants were not to be sown nor reaped on that day. The services of priests and Levites in and about the tabernacle and temple were, however, to be performed through the Sabbath day. Circumcision, too, could take place on the Sabbath, when it fell on the eighth day after the birth of a male child.

Profanation of the Sabbath was punished by stoning to death. It was not until after the exile that the character of the work by which the Sabbath could be profaned was strictly defined. In the law only one act of labor was specifically prohibited, that of lighting a fire for the purpose of cooking. According to Josephus, armies never proceeded on their march on the Sabbath.

Origin of the Sabbath.—The Sabbath appears to have been an institution of religion long prior to Moses. It is sometimes said that it was borrowed by him from older nations, such as the Egyptians. Such Latin writers as

Seneca and Ovid give intimations that the veneration for the seventh day had found some favor among the early Romans. It seems more natural to suppose that it had come down with the old traditions of theocratic religion which are found embalmed in the first chapter of Genesis. The poem of the creation, in which God is related to have created the world in six days and rested on the seventh day, embodies a tradition much earlier than the period of Mosaic legislation. There are several intimations in the patriarchal age that the followers of Jehovah, such as Abraham and Isaac, chose certain times for rest, meditation, prayer and sacrifice to God. In after times it would almost seem as if the poem or hymn of the creation was used as a special part of Sabbath-day devotions. On that day the people were called to reflect upon the fact that the whole universe, including themselves, had an origin in one personal and supreme Being; that He had exerted His Omnipotence for a definite period and then had ceased from His work. They were constantly to remind themselves of the work of God, once for all completed, by their own six days' round of labor; and as God has rested from His work so were they to rest from theirs and to turn their thoughts toward Jehovah «who had done so great things for them.»

Mosaic Ordinances of the Sabbath.— The scope and meaning of the Sabbath-day was very much extended and amplified by the provisions of the law as contained in the Hexateuch. It was made to be a day on which not only the finished task of creation was to be commemorated, but on which the great providential deliverances of the children of Israel were likewise to be recalled. But first of all the command is given by the law in various forms of speech, but with the same intent throughout the books of the law, Exodus, Deuteronomy and Leviticus, to remember the seventh day, the Sabbath, to keep it holy; most specifically in Lev. xxiii, 3: «Six days shall work be done: but the seventh day is the Sabbath of rest, an holy convocation; ye shall do no work therein: it is the Sabbath of the Lord in all your dwelling.»

First of all there are three specifications as to the manner in which the week is to be spent: (1) by labor — «Six days shalt thou labor, and do all thy work:» (Ex. xx, 9); (2) by rest on the seventh day; on this day the people are ordered to rest, literally to take breath, then are enumerated in detail those who are enjoined from work: «Thou, nor thy son, nor thy daughter, thy manservant, nor thy maidservant, nor thy cattle, nor the stranger that is within thy gates.» The penalty of death is threatened against all who shall disobey this command. The reasons of this command are given: (1) as a counsel of mercy — «Six days thou shalt do thy work, and on the seventh day thou shalt rest, that thine ox and thine ass may rest, and the son of thine handmaid, and the stranger, may be refreshed» (Ex. xxiii, 12); (2) as a commemoration of the deliverance from Egypt — «And remember thou wast a servant in the land of Egypt, and that the Lord thy God brought thee out thence through a mighty hand and by a stretched out arm, therefore the Lord thy God commanded thee to keep the Sabbath day» (Deut. v, 15); (3) as a commemoration of the finished creation «For in six days the Lord made heaven and earth, the sea, and all that in them is, and rested the seventh day: wherefore the Lord blessed the Sabbath day, and hallowed it» (Ex. xx, 11); (4) as a sign of the covenant, just as circumcision was the sign of the Abrahamic covenant, and the rainbow the sign of the covenant with Noah — «Speak thou also unto the children of Israel saying: Verily my Sabbaths ye shall keep, for it is a sign between me and you throughout your generations, that ye may know that I am the Lord that doth sanctify you. . . . It is a sign between me and the children of Israel for ever: for in six days the Lord made heaven and earth, and on the seventh day He rested, and was refreshed» (Ex. xxxi, 13, 17).

The Jews of to-day who profess to keep up the tradition of their fathers still keep the Sabbath as a joyful festival. The Sabbath is held from Friday evening to Saturday evening. It is among some of them considered a pious observance to begin the celebration half an hour before Friday's sunset and to continue it half an hour after sunset on Saturday for the benefit of the souls of those who are in torment, for they believe that the damned are allowed a mitigation of their suffering during the feast. On Friday afternoon all the food for the following day is prepared, and their festal array is laid out for the Sabbath. Some Jews have special raiment which they wear only on that day; on the morning of which the Sabbath lamp is lit and the Sabbath bread laid on the table. The master of the house at the close of the evening meal blesses the wine and passes it around. They eat three meals on the Sabbath-day and they have a maxim that it is good to honor the day in the body, in dress, in eating and in drinking. Consult Abrahams, Israel, 'Jewish Life in the Middle Ages' (London 1896); Floody, R. J., 'Scientific Basis of Sabbath and Sunday' (2d ed., Boston 1906); Jastrow, Morris, 'Hebrew and Babylonian Traditions' (New York 1914); Lotz, Wilhelm, 'Quæstiones de historia Sabbati' (Leipzig 1883).

SABBATIA, a genus of *Gentianaceæ*, often growing in sand or salt marshes. These plants have verticillate leaves, handsome terminal flowers, with white or pink rotate corollas 5 to 12-merous; 4 to 12 stamens with thread-like filaments and two-cleft styles, capsules more or less globose, coriaceous and containing many small reticulated seeds. Several species have a tonic, although bitter, juice, and are used as febrifuges. Although named in honor of an early Italian botanist, Sabbati, the genus is said to be so called because the Pilgrim Fathers discovered the local *S. stellaris* on a Sabbath. This charming species, called the marsh pink, or Rose of Plymouth, bears a very delicate pink flower, with a star-shaped yellowish eye.

SABBATICAL YEAR, the seventh year which the law of Moses provided should be a year of rest for the land (Ex. xxiii, 10, 11; Lev. xxv, 1–7). The land was not to be sown and that which grew of its own accord was not to be reaped, but to be left for the poor to eat. Vineyards and oliveyards were also to be left uncultivated, and their produce ungathered; but the people were allowed to fish and hunt, and attend to their bees and flocks, and a triple produce was promised for every sixth year to

make up for the deficiency of the seventh. The sabbatical year was also to be a year of release for Jewish debtors (Deut. xv, 1–6), but those who were able to lend were strictly enjoined not to refuse loans to poor and needy persons because the year of release was at hand (Deut. xv, 7–11). In this year also the law was to be read solemnly to all the people assembled at the feast of Tabernacles (Deut. xxxi, 10). This institution seems to have been almost entirely ignored during the period which preceded the captivity, and in 2 Chron. xxxvi, 21, the time of the captivity is represented as one in which the land was enabled, by the will of God, to enjoy the sabbaths or years of rest that the Israelites had omitted to allow it. After the captivity Nehemiah sought to secure the better observance of the septennial sabbath, as he did that of the weekly sabbath (Neh. x, 31), and he seems to have had some success in the former as well as in the latter effort. The historic fact that Alexander the Great remitted the Jewish tribute in the seventh year because the Jews were debarred by their religion from employing the means of raising it, shows that it was observed a hundred years after the time of Nehemiah.

SABBATION, sąb-bā′tē-ŏn, or **SAMBATYON,** sąm-bā′tē-ŏn, Syria, a legendary river in Hebrew history, mentioned in the Midrash Gen. Rabba, lxxiii, in the Palestinian Talmud, by Josephus, as "the Sabbatic river," and by Pliny as "a river that ran for six days and rested on the seventh," whence its name, derived from the Hebrew *Shabbāth* — Sabbath. It has been assumed to be the stream issuing from Fauwar ed-Deir, an intermittent spring in Lebanon. Mohammedans identify it with the Nahr-al-Arus in the neighborhood described by Josephus, which in modern times flows every third day. The river came into prominence in the 9th century owing to the story of the 'Children of Moses,' by Eldad the Danite, who describes the territory of the site of the exile of the Ten Tribes as surrounded by "this river of sand and stone which rolls during six working days and rests on the Sabbath day. As soon as the Sabbath begins, fire surrounds the river, and the flames remain until the next evening, when the Sabbath ends." The legend with variants has been repeated by different authors in succeeding centuries. See LOST TEN TRIBES, THE.

SABELLA, a genus of annelids dwelling on sandy shores in tubes formed solely of sand, the particles of which are glued together by means of a natural cement secreted by the worms, and thus form a smooth regular tube, presenting a striking contrast in its uniformity to the rougher dwelling-tubes of allied genera, such as *Terebella.* The worm itself possesses a slender body, the hinder part of which may be doubled up within the tube. The head is provided with slender tentacles.

SABELLIANISM, the theological views of Sabellius (q.v.), which, though they had numerous advocates, were condemned by the Church as heretical. See MONARCHIANS.

SABELLIUS, są-bĕl′ĭ-ŭs, Christian teacher: b. Pentapolis, Africa, or Italy. He taught at Ptolemais in Upper Egypt during the pontificate of Zephyrinus (199–217) and Calixtus I (217–222), and is known as the founder of a sect who considered the Son and Holy Ghost only as different revelations or manifestations of the Godhead, but not as separate persons (see MONARCHIANS). The doctrines of Sabellius were opposed by Dionysius of Alexandria and Dionysius of Rome, by Epiphanius (who states that the Sabellians were very numerous around Rome and in Mesopotamia) and by Theodoret. Saint Augustine states that by the beginning of the 5th century they had entirely disappeared. Yet their views have always found adherents, and even now some theologians attempt to reconcile theology with reason by admitting conceptions of the Trinity coinciding with that of Sabellius. For his teaching Sabellius was excommunicated by Pope Calixtus.

SABIANS. See SABÆANS.

SABIN, sā′bĭn, **Alvah Horton,** American chemist: b. Norfolk, N. Y., 9 April 1851. He was graduated at Bowdoin College in 1876 and was professor of chemistry at the University of Vermont in 1880–86, also serving as State chemist in 1882–86. In 1888–1905 he was engaged in the varnish business in New York, and in 1910–37 was consulting chemist for the National Lead Company, New York. He was lecturer at New York University 1897–1925. He invented the process for manufacturing sugar of milk in 1883. Since 1907 he has been sectional editor of the *Chemical Abstracts Journal* of the American Chemical Society. Author of 'Industrial and Artistic Technology of Paint and Varnish' (1904); 'Red Lead and Paint Material' (1917); 'House Painting' (4th ed. 1928); 'Painting Structural Steel' (1929).

SABIN, Edwin Legrand, American writer: b. Rockford, Ill., 23 Dec. 1870. He was graduated from the University of Iowa in 1892 and has published 'The Making of Iowa' (1900); 'The Magic Mashie' (1902); 'Beaufort Chums' (1905); 'When You Were a Boy' (1905); 'Bar B Boys' (1909); 'Range and Trail' (1910); 'Circle K' (1911); 'Old Four Toes' (1912); 'Pluck on the Long Trail' (1912); 'With Carson and Fremont' (1912); 'Treasure Mountain' (1913); 'On the Plains With Custer' (1913); 'Scarface Ranch' (1914); 'Kit Carson Days' (a biography, 1914); 'Buffalo Bill and the Overland Trail' (1914); 'Gold Seekers of '49' (1915); 'With Sam Houston in Texas' (1916); 'The Boy Settler' (1916); 'Opening the West with Lewis and Clark' (1917); 'The Great Pike's Peak Rush' (1917); 'White Indian' (1925); 'Rio Bravo' (1926); 'Old Jim Bridger, etc.' (1928); 'Gold' (1929).

SABIN, Ellen Clara, American educator: b. Sun Prairie, Wis., Nov. 29, 1850; d. Madison, Wis., Feb. 3, 1949. Her father, Samuel Henry Sabin, served in the 40th Wisconsin regiment in the Civil War. Miss Sabin studied at the University of Wisconsin in 1865–1868, and in 1895 received from that institution the honorary degree of A.M. In 1912 Beloit College conferred on her the degree of Litt.D. and in 1915 she received the degree of LL.D. from Grinnell. Miss Sabin began her professional career in 1866 as teacher in the district school at Sun Prairie, Wis.; from 1869 to 1872 she was employed as teacher at Madison, Wis., where she became principal of the grammar school.

In 1873–85 she taught in Portland, Ore., spent the year 1885–86 in Europe, and in 1887–90 was superintendent of schools of Portland, Ore. In 1891 Miss Sabin became president of Downer College, Fox Lake, Wis., and from 1895 to 1921 was president of Milwaukee-Downer College. At the Columbian Exposition at Chicago in 1893 Miss Sabin was juror of the educational exhibit and from 1886 to 1892 was member of the National Council of Education.

SABIN, Joseph, American bibliophile: b. Braunston, Northamptonshire, England, 9 Dec. 1821; d. Brooklyn, N. Y., 5 June 1881. After apprenticeship to Charles Richards, bookseller of Oxford, he set up a bookshop of his own there, but in 1848 came to this country, where he conducted establishments for the sale of old and rare works in New York 1850–56, in Philadelphia 1856–60, and New York 1860–81. His bibliographical knowledge was wide, and he is said to have crossed the Atlantic not less than 25 times for the purchase of unique specimens. From 1869 he published for a number of years *The American Bibliopolist.* He also prepared several compilations, among them 13 volumes of an uncompleted 'Dictionary of Books relating to America.'

SABINE, Sir Edward, English physicist: b. Dublin, Ireland, 14 Oct. 1788; d. Richmond, Surrey, 26 June 1883. He was educated at the military colleges of Marlow and Woolwich and in 1803 entered the army where he was commissioned 2d lieutenant of artillery. He served in the war with the United States in 1813–14 and accompanied Ross and Parry in their Arctic expedition in 1818 and that of Parry in 1819–20. While on these expeditions he engaged in researches in terrestrial magnetism and in 1821–25 conducted a series of voyages extending from the Arctic regions to the equator, gathering data concerning the magnetic needle, the figure of the earth and other points in meteorological and terrestrial physics. He was instrumental in the establishment of permanent magnetical and meteorological observatories, retaining directorship of those in the colonies for many years. In 1818 he was elected to the Royal Society, was its vice-president in 1850 and in 1861–71 acted as its president. He received rank as lieutenant-general in the army in 1859 and was retired with full rank as general in 1874. His works include 'An Account of the Experiments to determine the Figure of the Earth' (1825); 'The Variability of the Intensity of Magnetism upon Many Parts of the Globe' (1838), etc.

SABINE, Lorenzo, American historian: b. New Lisbon, N. H., 28 Feb. 1803; d. Boston, Mass., 14 April 1877. He sat in the New Hampshire legislature for three successive terms, but removed to Massachusetts in 1849, and was a Whig member of Congress in 1852–53. He is best known for his important work on 'The American Loyalists, or Biographical Sketches of Adherents to the British Crown in the War of the Revolution' (1847). He also published 'Life of Preble' (1847); 'Reports on the Principal Fisheries of the American Seas' (1853); 'Notes on Duels and Duelling, with a Preliminary Historical Essay' (1856), etc.

SABINE, Wallace Clement, American physicist: b. 13 June 1868; d. 10 Jan. 1919. He was graduated at Ohio University in 1886 and at Harvard in 1888. He was, until he died, connected with the faculty at Harvard, was professor of physics there in 1905–14, and after 1914 Hollis professor of mathematics. He was agrégé professor at the University of Paris in 1916–17. Author of 'Architectural Acoustics' (1900).

SABINE, a river of the United States, which has its rise in the northeastern part of Texas, in Hunt County, flows southeast about 250 miles, then turns southward and forms the boundary between Texas and Louisiana, and enters the Gulf of Mexico through Sabine Lake and Sabine Pass. It is approximately 550 miles long and has a drainage area of about 10,400 square miles.

The Sabine River is part of the Sabine-Neches Waterway, which is a consolidation of the improvements of the harbor at Sabine Pass, the Port Arthur Canal, the Sabine-Neches Canal, including the Sabine River to Orange (Tex.) and the Neches River to Beaumont (Tex.). Sabine Pass is the mouth of Sabine River. It is on the Gulf of Mexico 80 miles east of Galveston and 435 miles west of New Orleans. It is about seven miles long and from 1,700 to 5,000 feet wide. It connects Sabine Lake with the Gulf of Mexico. Both Sabine Pass and Sabine River have been improved by the Federal government (with local co-operation) at great expense, the original project for the improvement of Sabine Pass having been adopted by Congress in 1875, modifications and new projects following in subsequent years. Jetties, wharves and other terminal facilities have been built, and channels deepened and widened to admit deep-draft ocean-going vessels, with the result that a very large commerce has developed, principally in crude and refined petroleum, but also in lumber, grain, iron ore and sulphur.

SABINE CROSS ROADS, Battle of, and BANKS' RETREAT TO ALEXANDRIA. Three miles southeast of Mansfield, De Soto Parish, La., one of the main roads from Alexandria to Shreveport is crossed by a road from Red River to Sabine River. At this crossing was fought a battle which marked the culmination and failure of what is known as the Red River Expedition. On 23 Jan. 1864, General Banks, then at New Orleans, received a despatch from General Halleck, dated the 4th proposing an expedition, to consist of the forces of Banks, Steele and such as could be spared by Sherman, for the capture of Shreveport, La., on Red River, and the recovery of Texas, thus opening access to the cotton of that section and stimulating trade. Banks had, on a previous occasion, for sound reasons, objected to such a campaign, but now acquiesced and promised a cordial co-operation; but he set forth the difficulties in the way, and made suggestions to remove them, not one of which was regarded. Engrossed with duties concerning political affairs in Louisiana, which had specially been confided to him by the President, Banks could not immediately leave New Orleans, and he entrusted the arrangements of the expedition to Gen. W. B. Franklin, his second in command, who was to move from the Teche 5 March, reach Alexandria on the 17th, and co-operate with a strong fleet under command of Admiral Porter. Porter arrived at the mouth of Red River on 7 March, with

a fleet of 15 ironclads and four light steamers, and there he was joined some days later by transports from Vicksburg, carrying four divisions of Sherman's army, under Gen. A. J. Smith, and the Marine brigade of Colonel Ellet. A part of the plan of campaign was that General Steele, with an army of 15,000 men, should move from Little Rock, Ark., directly on Shreveport; but Steele, after marching from Little Rock to Camden, was checked, fell back to Little Rock and took no further part in the campaign. (See JENKINS' FERRY, BATTLE OF). Smith's forces advanced, attacked and in conjunction with the navy, 14 March, captured Fort de Russy, up Red River, together with 283 prisoners, 10 guns, and many small arms, the Confederate covering force of 3,500 men, under General Walker, after burning two steamboats and a considerable quantity of cotton, retreating up the river. It was not until the 19th that Franklin, with very little opposition, which was brushed aside by his cavalry, reached Alexandria. Banks joined him on the 24th, but his entire column did not close up until the 26th. Meanwhile General Mower, with three brigades of Smith's division and a cavalry brigade of the 19th corps, marched from Alexandria on the 21st for Henderson's Hill, 25 miles westward, surprised the 2d Louisiana cavalry, and with slight loss captured 250 men, nearly as many horses, and four guns, with their caissons. Near Alexandria the fleet came to a series of rapids, and the water was so low that the ironclads could not run up them, but after a week's hard labor the lighter ones were carried over. The transports, which could not pass, returned to Vicksburg, and with them Ellet's 3,000 men. The withdrawal of the transports made it necessary to establish a base at Alexandria and to use a wagon-train to carry the supplies, while it was also necessary to leave a guard of nearly 4,000 men (under General Grover) to protect the place. General Franklin, with the main column, advanced on the road running west of and parallel to the river, to Natchitoches, about 80 miles above Alexandria, driving before him the Confederate cavalry, and reaching Natchitoches on 3 April, where he was joined by A. J. Smith's column, which, accompanied by Porter's fleet, had come to Grand Ecore, four miles from Natchitoches. Porter had a fleet of 13 gunboats and 30 transports.

Banks' army, on the eve of march from Natchitoches for Shreveport, was composed of two divisions of the 13th corps, under Gen. T. E. G. Ransom; five brigades of the 16th corps, under Gen. A. J. Smith; Gen. W. H Emory's division, three brigades of the 19th corps; and Colonel Dickey's brigade of colored troops, under General Franklin; Gen. A. L. Lee's division of cavalry and mounted infantry, four brigades; and a small artillery reserve, under Captain Closson. These numbered 31 March 25,735 officers and men, with about 65 guns. Lee's cavalry force of 4,500 men had pushed out westward, 12 miles; on 2 April it ran across Confederate cavalry, drove it back eight miles, and then withdrew to wait for the general advance. This began on the morning of the 6th, led by Lee's cavalry, followed by the two small divisions of the 13th corps, under Ransom, and by Emory with a division of the 19th corps and Dickey's brigade of colored troops. On the morning of the 7th A. J. Smith followed with Mower's division of the 16th corps. A division of the 17th corps, 1,730 strong, under Gen. T. Kilby Smith, remained with the transports, under instructions to conduct them to Loggy Bayou, opposite Springfield, about midway between Natchitoches and Shreveport, 110 miles by the river, above Grand Ecore, where he was to halt and communicate with the army at Sabine Cross Roads, 54 miles from Grand Ecore. Porter, Smith and the transports, with six gunboats carrying 17 guns, started on the 7th.

Lee's instructions from General Franklin were to attack the enemy wherever found, but not to bring on a general engagement. On the 7th he drove a brigade of General Green's beyond Pleasant Hill, and came upon a strong force under Green at Wilson's Farm. Lee attacked and after a hard engagement of two hours drove Green to Saint Patrice's Bayou, eight miles from Pleasant Hill. Here Lee bivouacked for the night, and sent back for infantry support. His loss had been 53 killed and wounded. Green's loss was greater, including about 100 prisoners. That night Franklin reached Pleasant Hill; A. J. Smith's division was still a day's march in rear of Franklin. At daybreak of the 8th Lee, having been reinforced by one of Landram's brigades of the 13th corps, dropped his wagon-train, and, moving forward, drove the Confederates from Saint Patrice's Bayou and gradually pushed them to a wood beyond a clearing at Sabine Cross Roads, and found himself in the immediate front of Gen. R. Tayor's army of 10,000 men. Taylor, whose forces had been much scattered, in Arkansas, Louisiana, and Texas, had concentrated them, and near Mansfield had the three divisions of Generals Green, Walker and Mouton — 10,000 men. On the morning of the 8th he moved three miles from Mansfield to Sabine Cross Roads and formed line in the edge of a wood, commanding, on both sides of the road, a clearing about 1,200 yards long, and 800 wide, through the middle of which was a deep ravine. He knew that Banks' column was stretched out on a single road for more than 20 miles, and was sanguine of success in attacking the head of it. Lee threw out a strong skirmish-line and waited for Banks' main body to come up. At noon Ransom arrived with a brigade, and line was formed. Banks rode up a little past noon, and sent back repeated orders for Franklin to hurry forward. After heavy and continuous skirmishing, lasting until 4.30 P.M., Taylor threw his entire force of 10,000 men heavily upon the Union line; Mouton's division and two brigades of dismounted cavalry made an impetuous charge upon the Union right, in which Mouton was killed at the first onset, while Walker's division and a brigade on its right fell upon the centre and left of the line. For nearly an hour the men (not over 4,500) of Banks' command resisted this attack, and then were compelled to fall back to the woods in rear of the open space at the cross roads, with heavy loss, including three guns. Franklin had come up with Cameron's division of the 13th corps, and a new line was formed, to be immediately broken by heavy attacks on both flanks and front. The Confederates were gaining the rear, and the Union line was pressed back along the

narrow forest road filled with wagons and mules of the supply-train, stragglers, and camp-followers, which so blocked the way that an orderly retreat was impossible. Soon a panic set in, the cavalry train of 156 wagons was captured, Ransom's 10 guns were taken, along with 1,000 of his men; Franklin and Ransom were wounded, some of the best officers were struck down; and in spite of the heroic efforts of Banks and others to rally them, nearly the whole army broke into a disorderly retreat, which was checked only at Pleasant Grove, three miles from the field of battle. Here General Emory, with his division, had come up at 6 P.M., and formed line in the edge of a wood, on a ridge overlooking a small stream; and scarcely had his line been formed when the panic-stricken fugitives came rushing back through it to the rear. The Confederates were close on their heels, made an immediate assault upon Emory, and were met with a severe fire delivered at close quarters that instantly checked them. After an hour and a half of fierce battle, in which they made desperate efforts to turn Emory's right, the Confederates were everywhere repulsed with great loss, but held the shores of the stream. Banks' army, after having advanced to within two marches of Shreveport, had been saved from total destruction "by a triumph of valor and discipline on the part of a single division and of skill on the part of its intrepid commander." The action is known as the battle of Pleasant Grove. The Union loss at Sabine Cross Roads and Pleasant Grove was about 1,050 killed and wounded and nearly 1,800 missing; the Confederate loss, 1,500 killed and wounded.

Banks had been limited as to time in carrying out the objects of his campaign. General Sherman was calling for A. J. Smith's troops, and General Grant, who had set his heart on a movement by Banks from New Orleans on Mobile, had written him: "I had much rather that the Red River expedition had never been begun, than that you should be detained one day beyond the first day of May, in commencing the movement east of the Mississippi." The allotted time was fast expiring, Banks concluded to abandon his expedition. The night of the 8th he fell back 15 miles to Pleasant Hill, which was reached by Emory's division, that brought up the rear about 9 o'clock next morning. A. J. Smith, with a part of his command, had halted at Pleasant Hill, on the evening of the 8th, and with less than 13,000 men Banks formed a double line; the first, of the 19th corps, along a thickly wooded slope half a mile west of Pleasant Hill; the second, of A. J. Smith's command and the artillery, on a plateau in rear. The trains, preceded by Lee's cavalry and Dickey's brigade of colored troops, and followed by the remnants of Ransom's division, were put on the road to Grand Ecore. General Taylor, reinforced by the divisions of Generals Churchill and Parsons, had followed Banks very cautiously, and at noon his advance appeared and began skirmishing. Later artillery was brought up and opened fire, and a demonstration was made on the Union right. About 5 P.M. three Confederate divisions charged out of the woods upon the left flank of the Union line, which was steadily driven back up the hill to the cover of the second line. Here the Confederates were repulsed with great loss. Meanwhile the right of the Union line, though hard pressed, stood firm until, the left being driven back, it was nearly enveloped and gave ground, and the Confederates pressed on to an attack on A. J. Smith, who held the second line in reserve. After a short and sharp exchange of fire, Smith's and part of Emory's men made a charge and pushed back the Confederate line. All the reserves were now thrown into action, and the Confederates were routed, driven from the field and pursued until dark. Gen. E. Kirby Smith, the Confederate department commander, says: "Our troops attacked with vigor and at first with success, but, exposing their right flank, were finally repulsed and thrown into confusion. The Missouri and Arkansas troops, with a brigade of Walker's division, were broken and scattered. The enemy recovered cannon which we had captured the day before, and two of our pieces with the dead and wounded were left on the field. Our troops were completely paralyzed and disorganized by the repulse. . . . Our repulse at Pleasant Hill was so complete and our command was so disorganized that had Banks followed up his success vigorously he would have met but feeble opposition to his advance on Shreveport."

Banks had at Pleasant Hill 12,600 men, of whom 150 were killed, 844 wounded and 375 missing. Taylor had 14,300 engaged, of whom about 1,000 were killed and wounded, and nearly 500 missing.

Encouraged by his success at Pleasant Hill, Banks gave orders for a forward movement next morning on Shreveport, and preparations were being made for the march, when General Franklin and other officers dissuaded him from it, and it was decided to fall back to Grand Ecore and unite with the fleet. The retreat was resumed during the night and Grand Ecore reached on the 11th. E. Kirby Smith joined Taylor after the close of the battle of Pleasant Hill, and determined to move against General Steele in Arkansas. Taylor withdrew his infantry to Mansfield on the 10th and 11th, leaving the cavalry, under Green, and Polignac's infantry division of 2,000 men to watch and harass Banks. Upon his arrival at Grand Ecore, Banks intrenched, threw a pontoon-bridge across the river, put part of his force on the other side and waited for the fleet to come down. Porter, with the gunboats and Kilby Smith, with the transports, had arrived at Loggy Bayou on the afternoon of the 10th, where, two hours later, they received news of Banks' misfortunes, and on the morning of the 11th received his orders to return to Grand Ecore. The fleet turned down stream, but it was not to reach Grand Ecore without opposition. On the evening of the 11th Green, who had been left at Pleasant Hill, started with 750 men and two batteries for Blair's Landing, and on the 12th, with about 500 men and three guns, attacked the fleet and transports as they were running down the river. A brisk fight followed, General Green was killed by a discharge of grape from one of the gunboats and his men were driven off, with small loss. The Union loss was 57 killed and wounded. By the 15th all the gunboats were back to Grand Ecore, and as fast as the vessels could pass the bar they made their way to Alexandria, one

gunboat being lost. The fleet having passed down, Banks marched from Grand Ecore on the 22d for Alexandria, and that night bivouacked at Clouterville, 32 miles from Grand Ecore. The march was resumed on the 22d, and on the morning of the 23d, while marching along Cane River, a branch of the Red, the head of the column was checked at Monett's Ferry by General Bee, with four brigades of 2,000 men and four batteries. Bee's position was a strong one on a bluff commanding the crossing, and on the only practicable road to Alexandria, 35 miles distant. At the same time the Confederate cavalry under General Wharton and Polignac's infantry were harassing Banks' rear. General Birge, with his own brigade and Cameron's division of the 13th corps, in all about 5,000 men, crossed Cane River three miles above the ferry, and by a difficult flank march of several miles reached a hill, the occupation of which rendered Monett's Bluff untenable. Birge attacked at 2 P.M., after a contest of two hours carried the hill, and the Confederates retreated and left open the road to Alexandria. The Union loss was 150 to 200 killed and wounded. Banks resumed his march on the 24th, and without further serious opposition entered Alexandria on the 25th. Banks reported that in the 24 days intervening between the march of the army from Alexandria and its return there his own army had marched 400 miles. He had fought several battles, and been successful in all but one, and his losses were 289 killed, 1,541 wounded and 2,150 missing, an aggregate of 3,980. The difficulty of getting Porter's fleet over the shallow rapids near Alexandria detained Banks at that place until 13 May, when he continued his retreat. (See YELLOW BAYOU, ENGAGEMENT AT). Consult 'Official Records' (Vol. XXXIV); Taylor, 'Destruction and Reconstruction'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. IV).

E. A. CARMAN.

SABINE MOUNTAINS, Italy, a branch of the Apennines, near the border of ancient Latium, east of Rome, is a lofty group in the upper valley of the Aternus; the highest summit reaches an altitude of about 4,200 feet.

SABINE PASS, Engagement at. On 6 Aug. 1863 General Halleck informed General Banks, in command at New Orleans, that there were important reasons why the United States' flag should be raised at some point in Texas, with the least possible delay. Halleck's dispatch was by direction of the Secretary of War, and it was understood that the proposed movement was of diplomatic rather than a military character, and intended to prevent European complications. Banks was left to his own judgment how to conduct the campaign, but it was suggested that the most feasible route would be by the Red River to Shreveport. Banks, deeming the Red River route impracticable at that season of the year, fitted out an expedition to make a lodgment in Texas at Sabine City, on Sabine Pass, the outlet from Sabine Lake into the Gulf of Mexico, and the terminus of a railroad penetrating eastern Texas, and making connection with Houston, the capital of the State. General Franklin was put in charge of the advance of the expedition of 5,000 men, and was instructed to land a few miles below Sabine Pass, move upon the Confederate works commanding it, and, if practicable, to seize Beaumont, on the railroad to Houston. Four light-draft gunboats, under command of Lieutenant Crocker, formed part of the expedition, which sailed from New Orleans on 4 September. Franklin disregarded his instructions to land 10 or 12 miles below Sabine Pass, and on Crocker's representation that he could silence the Confederate works in the pass, he and Crocker arranged for the gunboats to make a direct attack upon the works, drive out the garrison, seize or drive away two Confederate gunboats reported on the river and then land the troops. From the army 150 sharpshooters were distributed on the four gunboats. Early in the forenoon of the eighth the gunboats and transports crossed the bar at Sabine Pass, and in the middle of the afternoon three of the gunboats opened fire upon the small fort, mounting eight heavy guns, and held by 44 officers and men. The fire was immediately returned, two of the gunboats were disabled and surrendered and were taken in tow by two small Confederate craft. It was all over in less than an hour. Franklin made no serious attempt to land his troops, but immediately returned to New Orleans, having lost two gunboats, with their 15 heavy guns, nearly 50 killed and wounded and over 200 prisoners, among them Lieutenant Crocker, of the navy. Not a Confederate was hurt. Consult 'Official Records' (Vol. XXVI).

SABINES, sā'bīnz (Lat. SABINI, sa-bī'nī), a people noted in the early history of Rome, whose territory they adjoined. The Sabines were engaged in agriculture and grazing, and from the simplicity of their lives and their physical prowess they obtained a reputation like that of the Spartans for severity of discipline and sturdiness of character. The narrow limits of the Sabine territory made emigration necessary, and probably in this way they came in contact with the growing power of Rome. They fought the Romans with great courage, but were subdued about 290 B.C., and admitted to Roman citizenship, but not permitted to vote in civic affairs. They became merged in the republic and subsequent empire, and were lost to view as a separate people.

SABINUS, Masurius, Roman jurist. He flourished during the reign of Tiberius, and was a pupil of Capito. He was the founder of the school of Sabiniani, and was the author of several works much used and commented upon by later jurists, the most important being 'Libri iii, Juris Civilis,' which is not now extant.

SABLE, one of the fur-bearing animals (*Mustela zibellina*), found in Siberia, Asiatic Russia and Kamchatka, or its American representative (*M. americana*) which differs so little that it is doubtfully named as a separate species. The average length of the sable is about 18 inches, excluding the tail, which is somewhat bushy. The body partakes of the form of the weasels generally, in that it is elongated and vermiform. The fur is smooth, glossy and may be pressed or smoothed in any direction, owing to the mode of attachment of the hairs to the skin. In color it is a rich deep brown, which near the head may exhibit white markings, and frequently assumes a gray tint about the neck. The fur is heaviest during winter, and the dan-

gers experienced by the sable-hunters from sudden snow-storms obliterating the track, or from the inclement cold, can hardly be over-estimated. Sables are for the most part captured in traps, but are cautious animals, and their pursuit is attended with much difficulty. They make their homes in dens or cavities in hollow trees, and produce from three to five young at a birth, the young being born in March or April; and their general habits are those of the marten and weasel, but they are more shy and retiring.

Skins of the Russian sable fetch prices in Liverpool ranging from 3 to 10 guineas. The darkest skins are considered to be the finest. About 2,000 skins annually find their way to England. Most of these furs are used in Russia, where about 25,000 are said to be annually collected. When manufactured for linings sable fur may fetch prices as high as 1,000 guineas. The corporation robes of the London aldermen are lined with this expensive material, and the tails of sables are used in the manufacture of artists' brushes. See also Fur-Bearing Animals; Fur Trade.

SABLE, Cape, Florida, the southernmost extremity of the Florida peninsula, in Monroe County, and the southernmost point of the United States, in latitude 25° 7′ N. and longitude 81° 9′ W.

SABLE ANTELOPE, one of the largest and most handsome of African antelopes (*Egoceros niger*), of the same genus as the roan antelope, blaubok and others, and like them rapidly approaching extinction, as civilization more and more encroaches upon the plains of southern and eastern Africa. Its coat is a deep glossy black, markings upon the face, the buttock and the under parts being white. The great-ringed horns sweep back from the forehead in a sabre-like curve, and the neck is adorned with a mane. These antelopes went about, in old times, in herds, and were prizes for the sportsmen, while their flesh was excellent to eat. They are approaching extinction.

SABLE ISLAND, a low-lying island in the Atlantic, off Nova Scotia, in latitude 43° 55′ N. and longitude 60° W., 95 miles southeast of Cape Canso. It is a chain of sand dunes enclosing a lagoon, and is such a menace to navigation that the government of Canada maintained two lighthouses there until 1948 when one was dismantled. It has been called the graveyard of the Atlantic. It was formerly 40 miles long and is now but 20, gradually sinking. Upon its sandy ridges grow cranberries and wild grass, and attempts are being made to raise pines and other hardy evergreens. There are sandbanks in the vicinity. The only inhabitants are the lighthouse and lifeboat men attached to the life-saving station for the relief of shipwrecked persons. The island is known for its breed of hardy wild ponies.

SABOTAGE, săb-ō-täzh (Fr. sà-bō-tàzh), a term of French origin used both as substantive and verb to denote the deliberate waste or destruction of an employer's property, as goods in process of manufacture or manufacturing machinery; also the refusal to perform assigned work and obstruction in all possible ways of the regular process of production. During labor troubles workmen sometimes resort to sabotage as a means of putting pressure on their employers to enforce their demands. In England during the early years of the Industrial Revolution home weavers seeing their livelihood threatened by the rapid spread of the factory system often sabotaged the newly introduced power-operated machinery. In more recent times the introduction of labor-saving improvements in machinery and manufacturing methods with consequent curtailment of the working force has frequently led to acts of sabotage on the part of workers fearing a further reduction of employment. The rapid growth of labor unions in the late 19th and early 20th centuries, on the whole, reduced the amount of sabotage in industry; for the well organized and highly disciplined labor organizations of all highly industrialized countries have realized their responsibility, shared with management, to keep the wheels of industry operating, if at all possible, during negotiation of disputes, and also to keep means of production unimpaired during periods of strikes or lockouts. Sabotage has also been frequently used as an effective political weapon against an unpopular regime, as the Germans discovered in the countries occupied in World War II.

SABOTS, sà-bō′ (called also Getas) wooden shoes largely worn by the peasantry of France, Belgium, Holland and some other parts of Europe. They are especially useful in wet weather, and in moist places generally, being well adapted to preserve the feet from damp. Great numbers of sabots have been exported by France to Belgium. In some parts of England, as in Lancashire, shoes with thick wooden soles, but with leather vamps or "uppers," are worn by most of the artisan class. See also Boots and Shoes.

SABRE- or SABER-TOOTHED TIGERS, extinct cats of the family Machaerodontidae (or Nimravidae), a group whose remains occur as fossils from the Eocene up to the Pleistocene. They differ from ordinary cats (Felidae) in several anatomical features, having some peculiarities which ally them to the bears, and others recalling existing viverroids, as the foussa (*Cryptoprocta*). They are remarkable for the character of the dentition, which in the earlier genera comes near showing the complete number of teeth, but displays a steady tendency as the family history is followed toward the reduced number possessed by existing cats. At the same time the dentition is often distinguished by the huge size of the upper canines, which in some cases were five or six times as long as the neighboring teeth, and have been justly called "sabre-teeth." These tushes reached their highest development in the genus *Machaeodus,* whose species were of very wide distribution, occurring in both North and South America and in Europe. These carnivores were of various sizes, up to dimensions equal to those of modern tigers, and so little different in general from true cats that Cope places them within the Felidae. It began in the Eocene and continued down almost or quite to the Glacial Period, when the type seems to have become extinct because the great canines had overgrown their usefulness and become a hindrance instead of a help in getting a living. They finally became so large that the animal could not open its mouth wide enough to make use of them in biting, and the space be-

tween them would admit none but a very small piece of meat to enter, even if a large piece could be torn away. "Even when the mouth opens so far as to allow the mandible to pass behind the apices of the canines," remarks Cope, "there would appear to be some risk of the latter being caught on the point of one or the other canine, and forced to remain open, causing early starvation." Other prominent genera in the family are the plantigrade *Dinictis; Nimravus* and *Pogonodon,* with species as large as panthers; and *Hoplophoneus,* with dentition like modern cats.

SAC AND FOX INDIANS, an Algonquian people called by the French, Foxes (*Renards*), possibly because of their having a Fox clan. To themselves they were Muskwaki or red-earth people. When first noticed by the whites they inhabited central Wisconsin. The Ojibwas had driven them from the Lake Superior region and about 1760, being worsted in conflict with the French, they incorporated with the Sac tribe, with whom they have remained so intimately connected as to have been long regarded as one tribe. They are of the woodland type, formerly lived in bark houses and cultivated corn and vegetables. They developed a complex social organization and are noted for their conservativeness in adopting the customs of the whites. Their number at present is about 750.

Consult Owen, M. A., *Folk-lore of the Musquakie Indians of North America* (London 1904); Smithsonian Institution, Bureau of American Ethnology, *Handbook of American Indians* (Washington, D.C., 1907); Jones, W., *Ethnography of the Fox Indians,* Bulletin 125, Bureau of American Ethnology (Washington, D.C., 1939).

SAC CITY, city, Iowa, and Sac County seat; altitude 1,278 feet; on the north fork of the Raccoon River; and 94 miles southeast of Sioux City. It is served by the Chicago and North Western; and the Chicago, Milwaukee, St. Paul and Pacific railroads; and state and federal highways. Situated in a stock and grain farming region, it has allied industries, including sweet corn canneries. The city has a public library; a scenic tourist park; and the Sac-Fox Indian burial grounds are nearby. Government is by mayor and council. Pop. (1950) 3,170.

SAC FUNGI. See FUNGI.

SACAGAWEA, săk-ă-gă-wē'ă, **SACAJAWEA,** or **SAHCARGARWEAH** (Minnetarre name *Tsa-ka-ka-wias,* "BIRD WOMAN"; Shoshone name *Bo-i-naiv,* "GRASS MAIDEN"), American Indian guide of the Shoshone tribe, the only woman to accompany the Lewis and Clark Expedition of 1804–1806: b. about 1784; d. Shoshone Agency, Wyo., April 9, 1884. She was betrothed in infancy according to tribal custom, but was captured by the Minnetarres when a child and later gambled away by her captor to a Frenchman named Toussaint Charbonneau, whose wife she became and with whom she was living in the Dakotas when Lewis and Clark reached there. Charbonneau and Sacagawea were engaged as guides and spent the winter at Fort Mandan, where Sacagawea's son, Baptiste, was born Feb. 11, 1805. Sacagawea displayed remarkable ability as a guide, threading the way accurately to her own country which she had not seen since she was a child, and gaining the admiration of the expedition for her courage and resourcefulness. On one occasion at the risk of her life she rescued from an overturned canoe the records of the expedition and other light articles of great value to the explorers. She led the party to the camps of her own people Aug. 17, 1805, where she was immediately recognized, her affecting meeting with her brother Cameahwait, chief of the tribe, being described in the journals kept by Lewis and Clark. She was claimed by her betrothed husband, who, however, relinquished his claims upon finding her the wife of another and mother of a son whom she had carried on her back all the way. Here the devotion of the Indian woman procured for the white men food and horses from the Indians, while her shrewd sense and good counsels prevailed over her brother's determination to destroy the whites for the sake of their goods. Finding all her people dead except her brother and the child of a dead sister she immediately adopted the sister's child as her own, and according to the custom of her people never admitted the sister's son to be other than her own. This child, of pure Indian blood, was known as Basil; both children lived and had descendants. Sacagawea accompanied the party to the ocean, which was reached Nov. 7, 1805, and returned with Captain Clark by way of the Yellowstone, which region also she knew well. Upon their return to the Minnetarre country Charbonneau refused all inducements to accompany the explorers to civilization, and Sacagawea remained with him. Further mention is made of her and her son Baptiste in Clark's letters, but she then disappears until she was found, an old woman, in the Shoshone Agency. She told a clear and intelligible story, and although illiterate spoke excellent French, which, however, she spoke with less ease in the earlier days of the expedition. She died when about 100 years old. Monuments have been erected to her at Portland, Ore.; Bismarck, N. Dak., and by the State of Wyoming.

Consult "Sacajawea" in *Journal of American History* (September 1907); Thwaites, J. G., *Journals of Lewis and Clark Expedition,* 8 vols. (1904); Schultz, J. W., *Bird Woman* (1918).

SACALAIT, săk'ă-lā, a fish. See CRAPPIE.

SACATON GRASS. See GRASSES IN THE UNITED STATES—*Sporobolus.*

SACBUT, or **SACKBUT,** the word by which translators have rendered the *sabbeka* of the Hebrew Scriptures. The exact form of the sabbeka has been much disputed, but that it was a stringed instrument is certain, for the name passed over into Greek and Latin in the forms *sambukē, sambuca,* and the instrument so called is described by Athenaeus as a harplike instrument of four or more strings, and of a triangular form. It is not unlikely that this instrument was introduced among the Jews from the East, since one of the musical instruments most frequently occurring in the Assyrian sculptures answers very closely to this description, and may perhaps be identified with the sabbeka, the name of which is, besides, Chaldaic. Nothing resembling this Assyrian instrument is to be found on the Egyptian monuments or in the sculptures of Greece and Rome. Since the sabbeka was a stringed instrument the rendering sacbut is altogether wrong, since that was, at the time when our translation of the Scriptures was made, the name of a wind instrument now called the trombone. See TROMBONE.

SACCHARIN, săk'ka-rĭn, benzoïc sulphinide, $C_6H_4\langle^{CO}_{SO_2}\rangle NH$, has attained commercial importance and is manufactured on a large scale in many countries on account of its intense sweet taste, chemically pure saccharin being 500 times sweeter than cane sugar. The compound was discovered in 1879 by I. Remsen and C. Fahberg during an investigation of the oxidation products of toluene sulphone amide.

Some of its salts possess the intense sweet taste of the original compound. The sodium salt, $C_6H_4\langle^{CO}_{SO_2}\rangle NNa.2H_2O$, is the commercial "crystallose," 400 times sweeter than cane sugar, and being very soluble in water is extensively used as a sweetening medium in preference to the less soluble saccharin.

SACCO-VANZETTI CASE, The, an American *cause célèbre* which excited worldwide controversy due to a general belief that the defendants had been charged with a crime of which they were innocent, and had been convicted not upon the evidence but by reason of popular prejudice against persons holding heterodox political, social and religious views. During the winter of 1919–1920 a wave of antiradicalism swept the United States. Russian bolshevism had started its westward march, and the American press played up the machinations of the "Reds." In Massachusetts a number of Italians professing the philosophical anarchy of Luigi Galleani were imprisoned or deported. At the height of this antiradical campaign, the paymaster and guard of a shoe factory were killed on April 15, 1920, on the main street of South Braintree, Mass., and robbed of $16,000. On May 5 the police arrested two Italians, Nicola Sacco (b. 1891) and Bartolomeo Vanzetti (b. 1888), charging them with the crime. Both had emigrated to the United States in 1908. Sacco, when arrested, had been working for 11 years in a shoe factory at Milford, Mass., except for a year's absence in Mexico to avoid the World War I draft. His employers considered him an honest and dependable worker. Vanzetti had been a fish peddler since 1915. Their joint trial began May 31, 1921 at Dedham, before Judge Webster Thayer. No money was traced to them, nor was any evidence adduced to prove they had ever possessed the automobile in which the murderers escaped. The prosecution relied on two main points: (1) identification by eye witnesses; (2) the fact that on their arrest the men had made false statements to the police as to their movements on the day of the crime. But the defense presented evidence of the defendants and many witnesses placing them elsewhere when the crime was committed. As to the false statements, these were freely acknowledged and attributed to fear of imprisonment and deportation as radicals. On July 14, both were found guilty of first degree murder. Applications for a re-hearing were denied and the state supreme court refused to intervene. Meanwhile the confession of a condemned criminal in 1925 led to the discovery of corroborative evidence pointing to the likelihood that the murder had been committed by a bandit gang from Providence, R. I. Petitions for release of the accused were received from all over the world, and protests from such famous European intellectuals as Romain Rolland, Anatole France, Mazaryk and Einstein. But Massachusetts public opinion remained hostile to the defendants. New Englanders of the Puritan tradition regarded them as alien agitators, while the new Roman Catholic element hated them as apostates. For once these discordant groups united in resentment against "interfering outsiders." The death sentence was imposed on April 9, 1927. But increasing criticism both at home and abroad led Gov. Alvan T. Fuller to appoint an advisory committee consisting of a former probate judge and the presidents of Harvard and Massachusetts Institute of Technology to study the conduct of the trial. On August 3 the governor announced that he and the committee were unanimous in finding the trial fair and defendants guilty. Both defendants, protesting their innocence, were executed Aug. 23, 1927.

SACCOPHARYNX, a genus of *Muraenidoe,* with a single species (*S. flagellum*), a deep sea conger eel, of which only three specimens have been observed; muscular system very feebly developed; bones thin and soft, wanting in organic matter; head and gape enormous; stomach distensible in an extraordinary degree; vent at end of trunk. The specimens known have been found floating on the surface of the North Atlantic with their stomachs much distended, having swallowed some other fish many times their own weight. They attain a length of several feet. See also Deep Sea Exploration.

SACHEVERELL, să-shĕv'ë-rĕl, **Henry,** English Anglican divine: b. Wiltshire, about 1674; d. London, June 5, 1724. He was educated at Oxford and in 1705 was appointed preacher of Saint Saviour's, Southwark. While in this station he, in 1709, preached two famous sermons, the object of which was to rouse apprehensions for the safety of the church and to excite hostility against the Dissenters. Being impeached in the House of Commons he was brought to trial in February 1710, and on March 23, when the trial was concluded, was suspended from preaching for three years. This prosecution, however, excited such a spirit in the High Church party that it helped to overthrow the ministry of Godolphin, and established the fortune of Sacheverell, who, during his suspension, made a kind of triumphal progress through the kingdom. The same month that his suspension terminated (1713) he was appointed to the valuable rectory of Saint Andrew's, Holborn, by Queen Anne. Of the offending sermons 40,000 copies at least were sold, and of the record of the trial 30,000. Little was heard of Sacheverell after this party ebullition subsided, except through his numerous squabbles with his parishioners. His abilities, even according to writers on his own side, were very slight. Consult Stanhope, *History of Queen Anne's Reign* (1872).

SACHEVERELL, William, English Whig parliamentarian: b. 1638; d. Barton, Nottinghamshire, Oct. 9, 1691. He entered Parliament for Derbyshire in 1670 and bitterly opposed court policy, especially the secret treaty with France. A leader in investigating the "Popish Plot" and impeachment of Lord Arundel and the five popish lords (1678), he first suggested the Exclusion Bill to deny James the succession. Speaker Onslow called him the "ablest parliament man of Charles II's reign." See sketch in *The Dictionary of National Biography* by Sir George R. Sitwell.

SACHS, Edwin O., English architect: b. London, April 5, 1870; d. Sept. 9, 1919. Educated at University College School, London, and at the University of Berlin, engaging as an architect in London in 1892. In 1898, he applied electrical power to the working of the theatrical stage for the first time in England. Founded the British Fire Prevention Committee (1897) and organized the first International Fire Prevention Congress in London (1903) and the Special Fire Survey Force during World War I. Author of several works on theater construction and fire prevention.

SACHS, zäks, **Hans,** German meistersinger: b. Nürnberg 1494; d. there, 1576. By trade a shoemaker, he followed his business and made verses with equal assiduity. From about 1510 to 1515, he traveled over Germany practising his craft and studying the art of Meistergesang. Returning home, he became a master in his guild. He attached himself to the Reformation movement, to the spread of which he contributed not a little by a poem written in 1523 (*The Nightingale of Wittenberg*) in which he voiced his approval of Luther's cause. Sachs' literary productions total more than 6,000. Three volumes of his poems were published during his lifetime, and two more after his death. In the 17th and 18th centuries his works were neglected until Goethe drew attention to his merit in a poem published in the *Deutscher Merkur* (April 1776). In the 19th century, Sachs was used by Wagner as the prototype of one of his principal characters in *Die Meistersinger von Nürnberg.* Sachs' poems, notwithstanding a rudeness of language, are distinguished for striking description, feeling, invention, and wit.

SACHS, Julius von, German botanist: b. Breslau, Oct. 2, 1832; d. Wurtzburg, May 29, 1897. After attaining a full professorship at Freiburg in 1867, he established his own laboratory in Wurtzburg adding greatly to knowledge of the physiology of plants, the influence of light and heat upon them, and similar matters resulting from his experiments. He wrote *Lehrbuch der Botanik* (1868); and *Geschichte der Botanik* (1875).

SACHSENSPIEGEL, zäk'sĕn-shpē'gĕl, a collection of Saxon legal precepts and customs, written in the early 1200's in Latin and attributed to Eike von Repgow, a Saxon jurist. It had the force of law in some parts of Germany during the Middle Ages.

SACKBUT. See Sacbut.

SACKEN. See Bugonia Myth.

SACKETS HARBOR, village, New York, located in Jefferson County on the Black River Bay of Lake Ontario. It is largely a summer resort; the altitude is 246 feet. The village was settled about 1801. In 1809, the *Oneida,* the first of several United States war vessels built there, was launched; and in the War of 1812, it was an important naval station. Sackets Harbor Battleground, the site of an engagement during that war, is now a state park. Gen. Zebulon M. Pike is buried in the Military Cemetery. The Pickering-Beach Historical Museum contains relics of the early families of the area. Pop. (1940) 1,962; (1950) 1,240.

SACKETS HARBOR, Attacks on. At the outbreak of the War of 1812, the United States had troops at Sackets Harbor but only one ship on Lake Ontario, the *Oneida,* commanded by Lieut. Melancthon T. Woolsey. On July 19, 1812, Woolsey sighted a British fleet. He anchored his vessel where his guns could rake the entrance to the harbor, and mounted others on a bluff. After an hour's fight, the British withdrew. On May 29, 1813, a second attack was made by the British when Sackets Harbor was without naval defense. Its garrison numbered about 650, many of whom had no war experience. The British landed troops, but were finally halted by desperate resistance. However, during the battle and believing it lost, a naval lieutenant set fire to military stores. During the conflagration, the British retired with a loss of 259 in killed, wounded, and missing. On May 19, 1814, the British blockaded the harbor to prevent the exit of American frigates then under construction there, and sent 180 men to capture Woolsey and his men who were attempting to evade the blockade and bring back supplies from Oswego Falls by a water and land route. The Americans ambushed the British, capturing them and their boats, and on June 6 the British blockade was raised.

SACKVILLE, săk'vĭl, **Charles,** 6th Earl of Dorset and Earl of Middlesex, English courtier and poet: b. Jan. 24, 1638; d. Bath, Jan. 29, 1706. He became a wit and roisterer in the company of Charles II, and served under the duke of York in a naval engagement with the Dutch in 1665. He succeeded to the earldom in 1667, but was not in favor with James II and later became an ardent supporter of William of Orange, and was lord chamberlain of the household for several years following William's death. On the night before the naval engagement already referred to, he is said to have written or retouched his famous song, *To all you ladies now on land.* Little of his poetry is preserved. He was a patron of such poets as Prior and Wycherley, and Dryden dedicated to him the *Dialogue on Dramatic Poesy.* His only son, Lionel Cranfield Sackville, was made duke of Dorset in 1720.

SACKVILLE, Thomas, 1st Earl of Dorset and Baron Buckhurst, English statesman and poet: b. Withyham parish, Sussex, 1536; d. London, April 19, 1608. He became a student of the Inner Temple and was later called to the bar. In the Temple he wrote the last two acts of *The Tragedy of Gorboduc,* first English tragedy in blank verse, produced in 1561. Of a long poem, conceived by him and intended to comprehend a view of illustrious but unfortunate characters in English history, entitled *A Mirror for Magistrates,* he contributed only a poetical preface (the *Induction,* called by Sidney Lee the greatest English poem between *Canterbury Tales* and *The Faerie Queene*), and *Complaint of the Duke of Buckingham.* The work was completed by George Ferrers and Richard Baldwin (1559–1563). From 1558 to 1563, Sackville sat in Parliaments of Queen Mary and Queen Elizabeth. He was knighted and raised to the peerage in 1567. Between that time and 1598, he carried out a number of delicate missions at home and in foreign countries, and in 1599 was rewarded by the office of lord high treasurer, confirmed as a lifetime post by James I. In 1604, he was

created earl of Dorset. He ranks among the most prudent and able of the ministers of Elizabeth.

SACKVILLE, town, New Brunswick, Canada, in Westmorland County, 24 miles southeast of Moncton, on the Canadian National Railway. Mount Allison University is there. Plastics and machinery are manufactured. Pop. (1951) 2,873.

SACKVILLE-WEST, Sir Lionel Sackville, 2nd Baron Sackville of Knole, English diplomat: b. Cambridgeshire, July 19, 1827; d. Sevenoaks, Sept. 3, 1908. He entered the diplomatic service in 1847, was secretary of legation at Turin, Madrid, Berlin, and Paris; and envoy extraordinary and minister plenipotentiary to the Argentine Confederation (1872–1878) and to Spain (1878–1881). Appointed minister to the United States, and helped to negotiate the fisheries treaty of 1888. In October of that year, he received a letter from one who, representing himself as an Englishman naturalized in the United States, asked for voting advice in the ensuing presidential election. The minister advised his correspondent to vote the Democratic ticket as favorable to English interests. Sackville's recall was at once asked for; and, in default of prompt compliance, the Department of State sent him his passports.

SACKVILLE-WEST, Victoria Mary, English poet and novelist: b. Knole, Sevenoaks, England, March 1892, daughter of 3rd Baron Sackville, in the ancestral mansion presented to Thomas Sackville by Queen Elizabeth. In 1913 she married Harold Nicholson, journalist and diplomat. She first gained attention by her novel *Heritage* (1919) and a short story, *The Heir* (1922). Her most famous novels are probably *The Edwardians* (1930), and *All Passion Spent* (1931). She is author of a number of nonfictional works including *Knole and the Sackvilles* (1922), an account of her home and her family; *Passenger to Teheran* (1926), a story of some of her travels; *Country Notes* (1939) and *Country Notes in Wartime* (1940). *Pepita* (1937) tells the story of her maternal grandmother who was a Spanish dancer. Among her best known poems are *The Land* (1926) for which she was awarded the Hawthorndon Prize, and *The Garden* (1946) which gained her the Heinemann Prize. Her *Collected Poems* were published in 1932; *Another World Than This,* an anthology coedited with her husband, appeared in 1945; and *Nursery Rhymes* in 1947.

SACO, sä'kō, **José Antonio,** Cuban historian and publicist; b. Bayamo, Cuba, May 7, 1797; d. Madrid, Spain, Sept. 26, 1879. He was educated in Havana, and appointed professor of philosophy in the Seminary of San Carlos in 1821. He edited (1832–1834) the *Revista Bimestre Cubana,* but his liberal views caused his banishment, temporarily. After travels in Europe he resided in Paris for many years. He was elected a delegate to Madrid in 1866 to advocate political reforms for Cuba, and in 1878 was elected to the Spanish Cortes. His works include studies of slavery and of colonial government.

SACO, sâ'kō, city, Maine, in York County, altitude 60 feet; on the Saco River, opposite Biddeford, with which it is connected by bridges; on the Boston and Maine Railroad, and a federal highway. Largely residential, but produces textiles, textile machinery, and shoes, and has a considerable shipping business. The city has a public library and a historical museum. Thornton Academy (coeducational) was founded in 1811. Saco and Biddeford were both founded in 1630 and were called Saco until 1718 and Biddeford until 1762. Saco then renamed Pepperellboro, resumed its original name in 1805. It was chartered in 1867 and has a mayor and board of aldermen. Pop. (1940) 8,631; (1950) 10,324.

SACO, a river which rises in New Hampshire in the White Mountains, and flows southeast through Maine into the Atlantic Ocean. It is about 105 miles long and drains an area of 1,750 square miles. A number of rapids and falls in it furnish power for manufacturing.

SACRAMENTALS, certain objects, actions, or emblems, instituted or consecrated by the Roman Catholic Church, for the production of spiritual effects. Of such are the sacramental wine, bread or wafer; the rites of dedication, consecration, benediction; the emblem of the Agnus Dei or sacrificial lamb of God, in the celebration of the Mass or the Holy Eucharist. (See Sacraments.)

SACRAMENTARIANS, a religious term which at present is applied almost solely to members of the Christian church who sustain a "high" view of the efficacy of the sacraments. In past ecclesiastical history it had a wholly different meaning and was applied to those Reformers who refused to agree to Luther's doctrine of the real presence of the body and blood of Christ in the bread and wine. The Sacramentarian party were the authors of the Tetrapolitan Confession, so called from the four cities of Strasbourg, Constance, Lindau and Memmingen, which supported the Sacramentarian doctrines. This confession excluded all idea of a physical presence of Christ's body. The Swiss reformer Zwingli took a similar position on the question of Christ's presence in the Eucharist, and an article prepared by him declaring against the real presence was embodied in the confession of the Helvetic Church. The German Sacramentarians joined the general body of Protestants in resisting Charles V, and became merged with the Lutherans.

SACRAMENTO, city, California, is the capital of the state and the seat of Sacramento County. It is an inland port located in northern California at the confluence of the Sacramento and American rivers, 72 miles by air from San Francisco. The city, whose incorporated area is 16.88 square miles, lies at an altitude of 30 feet. It has a picturesque setting almost in the exact geographic center of Central Valley, with the Coast Range on the west and the snow-capped Sierra Nevadas on the east. The climate of the region permits the production of crops throughout the year in the rich, irrigated soil. The area is rich in certain other natural resources, such as timber, lead, pottery clay, oil, and natural gas. The natural gas fields and the water from the Sacramento River and its tributaries, harnessed to generate electricity, insure a plentiful supply of power.

Sacramento is an industrial, commercial, and cultural center, as well as the focus of state government activities. Most of the city's streets are broad and straight, and are tree-bordered in the residential areas and even along some of the commercial thoroughfares. There is little evidence of the extremes of poverty and wealth found in many cities; but in 1951 plans had been drawn up by the Citizens Redevelopment Advisory Committee for a 10-year building program to replace run-down areas with low-income housing projects, parks, and boulevards.

Transportation.—Sacramento is on the main lines of the Southern Pacific and the Western Pacific railroads; and the Atchison, Topeka and Santa Fe Railway has access to it over the rails of the Central California Traction Company, a freight road. The city is also on the Sacramento Northern Railroad, an intrastate freight carrier. From the city, all sections of Central Valley can be reached by highway, and federal highways connect it with other parts of the United States and with Canada and Mexico. There is a municipal airport with scheduled transcontinental and north-south commercial passenger service, connecting passenger schedules with trans-Pacific flights, and transcontinental air freight service. In the 1940's the annual tonnage carried by river craft in and out of the port ranged from about 800,000 to 1,400,000 tons. In the early 1950's another spoke was being added to this hub of transportation with the construction of a deep-water channel for ocean-going vessels, facilities for berthing these ships, and improved handling, transshipping, and storage facilities.

Business and Industry.—Sacramento has an extensive wholesale and retail trade. Among its industrial establishments are railroad shops, brick and clay yards, and factories where wooden boxes are made. As of 1951, however, its chief business was food shipping; and its chief industry, food processing. As a shipping point for fresh vegetables and fruits it ranked high in the United States. It had sugar beet refineries, flour mills, factories in which dairy products were made, and plants for canning and freezing fruits and vegetables, for shelling nuts, pickling olives, cleaning and polishing rice and beans, and preparing stock feeds. Although the city weathered the depression years of the 1930's exceptionally well, in the years following World War II the city's businessmen were working to attract new and more diversified industries. The 1950's may therefore see change in the economic pattern of Sacramento, with industry taking a more important place and a new emphasis upon the industrial byproducts of agriculture.

Educational, Cultural, and Recreational Facilities.—In addition to public elementary and high schools, the city maintains a junior college, and the Sacramento State College is located there. Sacramento also has Catholic parochial schools and private boarding and day schools. Both the Sacramento City Library and the California State Library are about a century old. The city's library contains a collection of approximately 323,000 volumes. The state's library collection totals about 500,000 volumes, including collections on law, Californiana, and publications in Braille. The Crocker Art Gallery contains a fine collection of drawings and paintings by such famed masters as Leonardo da Vinci, Michelangelo, Rembrandt, Albrecht Dürer, and Guido Reni. In the capitol and other state buildings are works of art, including modern murals depicting scenes from California history. The State Indian Museum contains exhibits illustrating the artifacts and ways of living of the California Indians. State-owned Sutter's Fort, a restoration of the fortified trading post with the ranch house, home, and workshop of the German-born settler with whose name California's gold rush is so closely associated, contains relics of those days. The Pony Express Museum, a city institution, contains relics of the city's early history. The building was once the office and relay station of the Pony Express.

In the city's places of worship all religions common to the United States are represented, and in it is one of the few Moslem mosques in the country. Sacramento has been the seat of a Catholic diocese since the 1880's.

Art, music, and other organizations, such as the Sacramento Civic Repertory Theater, also contribute to the cultural life of the city. The city owns and maintains Memorial Auditorium, with a hall seating 3,200 and an outdoor theater. For outdoor recreation, the city has a camp about 90 miles northeast in the mountainous region at which residents may live at cost for a two-week period during the year. Within the city limits are 32 well-distributed public parks and playgrounds covering 1,337 acres. In Capitol Park there are about 600 varieties of trees. Many of its 40,000 trees, bushes, and plants date from the time the capital was new and have come from all parts of the world. Because of the profusion of camellias in public and private grounds, California's capital is sometimes referred to as the City of Camellias. In the William Land Park are additional attractions—a zoo, an orchestral shell, and a golf course. The State Fair Grounds also offer a public place for picnicking and, besides the annual state fair, rodeos are held there. For organized sports there is the Sacramento Stadium with a seating capacity of 23,000, and Edmonds Field for professional baseball.

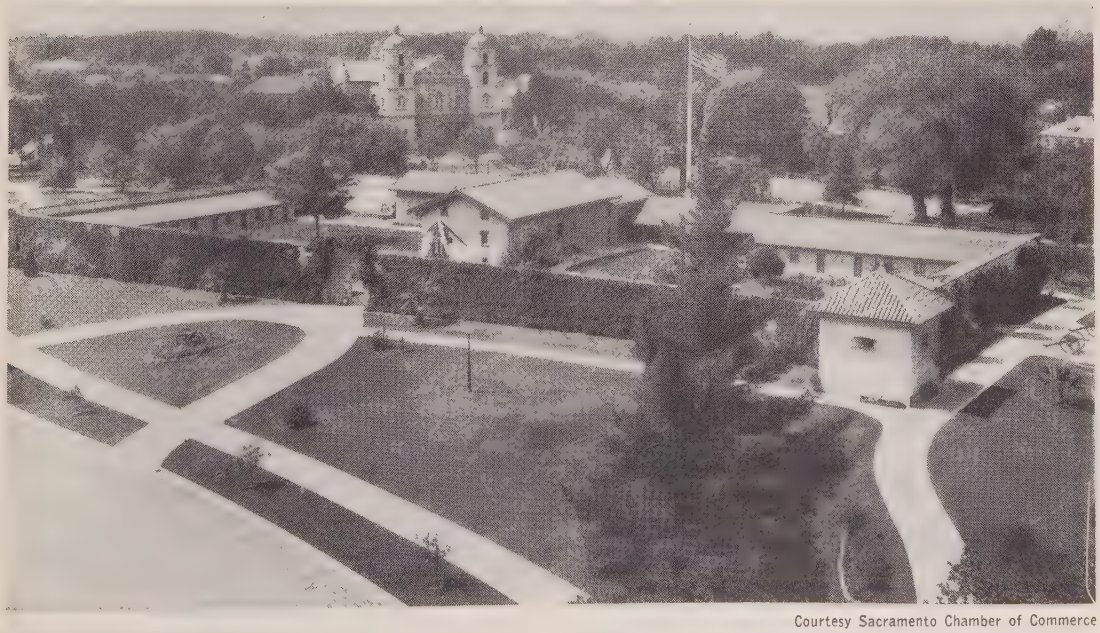
Other Points of Interest.—The building of the state capitol, on its sloping terrace in Capitol Park, was begun in 1860, and considered finished in 1874. It was constructed of California granite and white-painted brick, and its architecture closely resembled that of the national capitol. Extensive additions have since had to be made, and the cost up to 1952 totaled more than $10,000,000. The Memorial Auditorium, Italian Romanesque in design, is equipped with a fine organ and with chimes that ring out the national anthem once each day. The Tremont Hotel, built in the 1850's when Sacramento was a roaring frontier town and then considered one of its finest hostelries, still stands in the modern city. A brewery of the same period may also be seen near William Land Park.

Government.—Sacramento has a council-manager form of government with a mayor selected from among the members of the council, all of whom are elected at large on a nonpartisan ticket. The facilities owned and operated by the city include those of the port and the waterworks. The majority of the functions of state government are centered in the capital, and numerous branches of the federal government are represented there. At McClellan Field, adjacent to the city, the U.S. Department of Defense maintains an air depot as a repair and supply base for the Army Air Force. Mather Air Force Base, also near it, is a major training

center, and the U.S. Army Signal Corps also has a military installation nearby.

History.—In 1839, John Augustus Sutter, a German-born Swiss citizen, received permission from the Mexican governor to establish a colony in the interior of northern California. He and his party found a suitable place the same year on the south bank of the American River near its confluence with the Sacramento. There, with Indian, Mexican, and other help, he began clearing land, digging irrigation ditches, raising crops and livestock, and building his fort. The Mexican government granted him a total of 33 square leagues of land (nearly 87 square miles), including the present site of Sacramento. On this domain Sutter lived for a few years practically as an independent ruler. Soon after the occupation of California by American forces in 1846, he found so good a market for his produce along the northern California coast that he had several hundred men working for him. Great wealth seemed within his grasp. In January 1848, his chief carpenter, James W. Marshall, discovered gold in the tailrace of Sutter's mill on the south fork of the American River. That spelled the ruin of Sutter, for within a few months thousands of gold seekers were on the move by land and sea to California. The prices of farm products soared. Near Sacramento, 16 acres planted to potatoes brought $40,000. But Sutter did not profit. His farm hands left and joined the gold seekers, his stock was stolen, and squatters put up their tents and settled on his land. To save some part of his holdings, Sutter deeded a parcel of it along the Sacramento River to his son who quickly had a townsite plotted. The first lots were sold in January 1849 and, by August, river steamers from San Francisco were unloading passengers there. The town that sprang up was called Sacramento after the river which ran beside it, and it quickly became a supply and recreational center for miners. Before 1851, three newspapers were being published there. The town was ravaged by flood in 1849, but the following year it had a population of 6,820 and was incorporated. In the next few years, fire, flood, and a plague of cholera wrought their havoc. Nevertheless, this lusty town aspired to the honor of being the state capital, and in 1854 it was so designated. In 1856, the first railroad in the state connected the capital with mining towns along its 22-mile route to the northeast. In 1857, the Sacramento Library Association (from which the public library evolved) was founded, and among its founders were four young men from the East who were to make railroad history in a few years—Collis P. Huntington, Leland Stanford, Charles Crocker, and Mark Hopkins. In 1860, when the Pony Express was inaugurated, Sacramento became its western terminus. The population then numbered 13,785, and three years later it was incorporated as a city. In 1863, the Central Pacific Railroad began laying tracks east from Sacramento to meet the Union Pacific, thus giving the nation its first transcontinental rail route in 1869. It was the four men who had helped found the library association who were chiefly responsible for the building of the Central Pacific, and it was they who conceived the idea of joining it with other railroads, an idea which eventuated in the creation of the Southern Pacific in 1884. By then, the great gold rush days had long since passed; but the main supports of the city's present-day economy had been laid, and the feverish search for quick riches had given place to the development of agriculture in the area. Steadily, though unspectacularly, the modern city took shape. Levees and high street curbs were built in the early years to protect the city against floods; but, later, dams began to be constructed on the American and Sacramento rivers to provide a more even flow for the generation of electric power. These dams helped to control floods; but in the 1940's the building of multipurpose dams specifically included flood control among their objectives.

Population.—The foreign-born in Sacramento's early population were mostly Swiss, Ger-



Courtesy Sacramento Chamber of Commerce

Sutter's Fort.

man, and Irish. Mexicans, Italians, Greeks, Chinese, Filipinos, and Japanese largely made up the foreign-born population by 1940. Other changes came in the following decade. By 1950 the Japanese population was smaller than it had been before World War II brought about by the temporary removal of Japanese from West Coast areas; and the Negro population had increased. The following figures give the total population growth in the current century: (1900) 29,282; (1910) 44,696; (1920) 65,908; (1930) 93,750; (1940) 105,958; (1950) 137,572.

SACRAMENTO, a river in California which rises in the northern part of the state, flows south in the valley between the Sierra Nevada and the Coast Range and, uniting with the San Joaquin River (q.v.), both break through the Coast Range, and enter the Suisun Bay, from which the waters pass through a strait into the Bay of San Pablo, and to the Pacific through San Francisco Bay. The chief tributaries are the Pit and Feather rivers. The Sacramento is about 400 miles long; from the source of the Pit to the mouth of the Sacramento is about 600 miles. The river is navigable for about 270 miles from its mouth, and the Feather River for about 30 miles from the Sacramento. The débris from placer mining has been a hindrance to navigation.

Gabriel Moraga in 1808 gave the name Sacramento to its tributary the Feather, while the lower Sacramento was still called the Rio de San Francisco. However, Moraga's name was soon applied also to the lower Sacramento, as appears in a map of about 1824. Wilkes' map of 1841 finally established the river's name and course.

SACRAMENTS.—The word *sacrament* is derived from the Latin word *sacramentum,* which in its original use was employed for the oath taken following enrollment in the Roman armies; a legal use of the same word referred to a deposit made by those engaged in court-action, with the understanding that the loser forfeited his *sacramentum* to the state treasury, which, as some suppose, employed the money for sacred purposes. The fact that the word, in its root and significance, suggests something set apart as holy, indicates that both the military and the legal *sacramentum* were regarded as having some religious character.

Ecclesiastical Usage.—The term is more generally employed in contemporary usage to describe a sacred religious practice, although it can also have the connotation of a holy mystery; hence, it is related to *mysterion,* the Greek term employed to describe some hidden truth or reality which is made known to men through the revelation of God. It is with its ecclesiastical usage, however, that this article is concerned, since that is the prevalent sense of the word in ordinary speech.

Ecclesiastical Definition.—In this connection the term *sacrament* can be used in a general or in a narrower meaning. In the former, it is defined by St. Augustine as *signum sacrum* or *signum rei sacrae* (sacred sign or sign of a sacred reality), a definition which has been generally accepted by Christian theologians. The Anglican Book of Common Prayer gives a fuller statement, "an outward and visible sign of an inward and spiritual grace." The sacramental idea suggests that there is a general principle running through the created world, in which corporeal or material things are the expressive media for unseen, but genuine, realities of a spiritual kind. Values, ideals, and purposes are operative in, and their reality is expressed through, such material and corporeal realities: goodness is known and seen through good acts; beauty, through beautiful objects; love, through loving persons. More significantly, it is said that God is known in this fashion. St. Thomas Aquinas wrote: "Through signs that can be perceived by the senses, the mind is stimulated in its aim towards God"; and Catholic Christianity has maintained that the normal means for reaching the divine Reality is through such sacramental impressions of God.

Physical contacts, material realities, things done in the realm of the visible, tangible, corporeal, or sensible, are for Catholic Christianity the most effective way in which states of mind, attitudes, beliefs, and certainties of many sorts may be stimulated and even inaugurated, as well as deepened and enriched. Central in this pattern of material expression of spiritual reality is the Incarnation of God in Christ, in which it is believed that God employed, sacramentally, a human life as his means of self-expression in the created order.

Definition According to Rite.—When this general sense of the word *sacrament* is restricted to the ecclesiastical rites of worship, the definition of Hugh of St. Victor is adequate: "a corporeal or material element offered to the senses, which from likeness represents, from institution signifies, and from consecration contains, some invisible and spiritual grace." This definition includes four points which have generally been maintained as essential to a sacrament:

(1) The sacrament must have a sign which is a visible reality. This may be the pouring of water, as in baptism; the bread and wine of the Lord's Supper, Holy Communion, or Mass; the laying-on of hands, as in ordination and confirmation.

(2) Further, the sacrament must have some spiritual grace or gift, which is conveyed to the faithful recipient. In baptism this is forgiveness of sin and incorporation into the Church of Christ; in the Lord's Supper, the body and blood of Christ; in ordination, the grace of ministry; in confirmation, the strengthening for responsible Christian life.

(3) The sacrament must in some sense have been divinely instituted; it cannot be a mere human invention, but in one way or another must have attached to it the promise of the divine purpose, whether by explicit institution, as in the Last Supper of Jesus with his disciples, for the Holy Communion, or by some more general direction which has led to such a rite, as in the unction of the sick.

(4) Finally the sacrament must be efficacious in that it conveys or contains that which it professes to do; the view is held in Catholic Christianity that sacramental rites are not merely edificatory or teaching signs, but actually effect some result through their performance.

This definition has been further refined by theologians, such as Aquinas, in order to include the following ideas: *matter* of the sacrament, or some external and visible thing such as the eucharistic elements of bread and wine; *form* of the sacrament, or words which explicitly state the intention for which the rite is being performed; *minister* of the sacrament, or a person properly authorized to conduct the rite; *benefit,* or the good result which follows. A *valid* sacrament is one in which all these conditions are met.

In the Eucharist or Holy Communion, another term is introduced, the *res* of the sacrament, the underlying reality which it contains and conveys; in the Eucharist this is the body and blood of Christ.

Sacraments as Symbol and Instrument.—From the definition quoted above from Hugh of St. Victor, the phrases "from likeness represents and from institution signifies" introduce another set of ideas that have, especially in recent years, been much emphasized by theologians, especially Anglicans, such as Oliver Chase Quick: a sacrament is both a *symbol* and an *instrument.* By symbol is meant that there is in a sacramental rite some likeness which, in Hugh's phrase, "represents" that which is being commemorated or conveyed. Hence bread and wine in the Eucharist from likeness represent the body and blood of Christ, in this instance by divine institution; or in baptism, the pouring of water represents, from likeness, the washing away of sin (dirt) which soils the personality of the recipient. On the other hand, the sacrament is not merely symbolic, since it is a sign which effects what it symbolizes; it is thus instrumental. To some degree this notion rests back upon the Aristotelian conception of "efficient cause," and is suggested by St. Thomas Aquinas in his general discussion of the subject in the *Summa Theologica* where he uses the illustration of a woodman's ax effectual in felling a tree. The Reformed theologians of the 15th century were divided on this matter, some resting content with a merely significatory understanding of the sacrament, others, as in England, insisting that a sacrament is an "effectual sign"; compare the Anglican Articles of Religion, in the Book of Common Prayer.

Number of Sacraments.—Throughout Christian history the problem of the number of ecclesiastical sacraments has been a matter of theological discussion. All Christians, except the Society of Friends, have accepted baptism and the Eucharist as sacraments "generally necessary to salvation," in the sense that their use is the normal way of admission to, and participation in, the benefits of Christ; although there have been widely differing interpretations of the sense in which this is true. On the other hand, Catholic Christianity, in both eastern and western forms, has said that there are five other rites, of a sacramental nature, which may properly be called sacraments. These are: confirmation, marriage, absolution or penance, holy orders or the rite of setting-apart for the ministry, and unction or the anointing of the sick or dying. It was not until the Middle Ages that the number was set at seven, and even this does not provide for the variety of less formal rites and actions or objects which in Western Catholicism are called sacramentals.

Meaning of the Sacraments.—In the full scheme of seven sacraments, certain of the group are believed to be effective in conveying character or status in the relation of the recipient to God and Christ. In baptism, the person receiving the sacrament is made a member of the Body of Christ, the Church; in confirmation, he is given the special status of a communicant; and in ordination, he receives the position of an ordained person with particular rights which attach to this office. In this meaning of character the three sacraments are said to be "indelible"; that is, they can never be repeated because the status which has been granted is a permanent status. Protestant theologians have tended to deny this view, especially as regards ordination; but in the Anglican Church it has usually been held, as well as in the Roman Catholic and Eastern Orthodox churches.

Finally, the more traditional Christian view is that the sacraments are effectual apart from the moral character of the minister; this is the basic meaning of the concept of their operation *ex opere operato.* The Anglican Articles of Religion state this in the phrase: "That the unworthiness of the minister hindereth not the sacraments." In this way, it is said, the recipient is not dependent upon the intangible factor of ministerial holiness or intention. However, it is always considered necessary that a minister shall have at least this much by way of "intention": he shall purpose to do that which the church itself intends, even if his understanding of this is not complete. The sufficient guarantee that he so intends is his use of the normal matter and form which the church has prescribed and the fact that he is himself a properly authorized person to perform the rite.

Various Interpretations.—The interpretation of sacraments differs in the various Christian denominations and churches. The outline already given is in general that of Catholic Christianity, including the Anglican Communion. The Reformed churches of the continent of Europe, with their offspring in other parts of the world, have variations on this view. Calvinism and Lutheranism, as well as the followers of Zwingli (the Reformed Church, properly speaking), have tended to take a less systematic view, holding that the efficacy of the sacraments is due to the blessing of Christ, and that the formalized scheme is not necessary for an understanding of their operation. In some of these groups, great emphasis is placed on the faith of the recipient; although all Christians have maintained that, in one way or another, "faith is the means whereby we receive the sacrament."

More detailed discussion of the particular views of the several Christian groups may be found in the bibliographical notes. It is important to observe, however, that in recent years there has been a much stronger emphasis, throughout Christianity, on the importance of the sacramental idea in general and the significance of sacramental rites within the Christian Church. This has been associated with the liturgical movement of the Roman Catholic Church and with similar movements found in other denominations.

Professor of Christian Apologetics, General Theological Seminary.

SACRE-COEUR, sȧ'krā-kûr, **Basilica of the,** Paris, France, church dedicated to the Sacred Heart of Jesus, located at the summit of the Butte Montmartre. Decreed by a law of 1873 as a national votive offering after the Franco-Prussian War, the enormous cost of the basilica was met entirely by subscriptions and voluntary donations. It was begun in 1875, completed in 1914, and dedicated in 1919. The design from the plan by Paul Abadie (d. 1884), is 12th century Byzantine-Romanesque. With its numerous cupolas and

domes the Sacré-Coeur is the most unusual church in the city. Subsequent architects continued Abadie's general plan; the campanile, however, was raised according to the design of Lucien Magne, who completed construction. The church is built of white stone and concrete, and from its commanding position, is visible from almost every part of Paris. The main dome stands about 296 feet above the crypt. Around it is a gallery from which there is a view extending 35 miles on a clear day. The campanile, which rises 267 feet from the ground, contains la Savoyarde, one of the largest bells in the world. See also PARIS—*Points of Interest* (Religious Buildings).

SACRED HEART OF JESUS, in recent centuries, one of the most widespread and cherished practices in the Roman Catholic Church. It is based on the church's teaching with regard to its founder, Jesus Christ, who is both God and man, that is, He is but one single person having both the nature of God and the nature of man. Since Jesus Christ is a divine person, the second person of the Blessed Trinity who has become man, His Heart is truly "the divine Heart which wrought our salvation," to which is owed "honor and glory forever." Hence devotion is directed to the person of Jesus Christ, to His living, sentient Heart, and to that Heart as a symbol of the love that He has for His heavenly Father and for men. This devotion has a manifold purpose: to honor Christ, the Saviour of mankind; to seek that men's hearts be inflamed with love for Him whose love for them is recalled by thought of His Sacred Heart; and to make reparation for injuries committed against Him. Scriptural foundation for the devotion is found in the many references to the heart as the seat of thought, will, and affection, to Christ's own words, "Learn of me, because I am meek, and humble of heart" (Matthew 11:29), and other texts. Although there are patristic and medieval references to the Heart of Christ, as in the writings of such saints as Cyril, Cyprian, Basil, Ambrose, Francis of Assisi, Bonaventura, Bernard of Clairvaux, Gertrude, and Mechtilde, it was in the 17th century, partly in reaction against Jansenism, that the devotion began to spread most rapidly and widely among Roman Catholics. Chief among those who promoted it were St. Jean Eudes (1601–1680), Blessed Claude de la Colombière (1641–1682), and especially St. Marguerite Marie Alacoque (1647–1690), a Visitandine nun of Paray-le-Monial, France, whose letters contain records of private revelations that have become known as "the promises of the Sacred Heart." The 12th of these, "the great promise," reads: "The all-powerful love of My Heart will grant to those who shall communicate on the first Friday of nine consecutive months the grace of final perseverance." Closely connected with this devotion is that to Jesus Christ in the Holy Eucharist, with the attendant practice of frequent reception of Holy Communion. The devotion has inspired many beautiful prayers, notably the *Litany of the Sacred Heart,* the *Morning Offering,* and acts of consecration to the Sacred Heart. The Society of Jesus has long taken a leading part in promoting the devotion. The League of the Sacred Heart, commonly known as the Apostleship of Prayer, founded in France in 1844 by Father Francis X. Gautrelet, has a membership of over 30 million, and publishes its organ, *The Messenger of the Sacred Heart,* in many languages. Various religious communities, both of men and of women, have been dedicated to the Sacred Heart. Celebrated on the Friday after the octave of Corpus Christi, and usually falling in June, the month dedicated to the devotion, the feast of the Sacred Heart was established in 1765 by Pope Clement XIII and extended to the universal church by Pope Pius IX. Pope Leo XIII consecrated the human race to the Sacred Heart, and Pope Pius XI decreed that this consecration be renewed each year on the feast of Christ the King.

(London 1910); Wynne, *The Great Encyclical Letters of Pope Leo XIII* (New York 1903); Pope Pius XI, *Encyclical Letters,* "Quas Primas," "Miserentissimus Redemptor," and "Caritate Christi compulsi."

JOHN K. RYAN.

SACRIFICE.—The word *sacrifice* has two radically different connotations, and failure to recognize this opposition has often caused confusion in theological thinking.

Secular Definition.—The modern secular use of the word describes voluntary deprivation; its definition may be epitomized in "giving up." That which is given up—possessions, happiness, reputation—is always of some value to the sacrificer. It is frequently destroyed, or may pass into the possession of someone else, who is not, however, regarded as the recipient of a sacrifice. The deprivation is always effected so that the sacrificer may achieve a purpose which, to him or to some other person or cause, is of greater value than that of the object sacrificed. Illustrations of this are seen in the expressions, "He sacrificed his position for his principles," and "The soldier made the supreme sacrifice." The Oxford Dictionary gives the date 1706 when *sacrifice* was first used as a verb in this sense; as a noun it had been so used much earlier.

The word came into use by medium of the Christian Church, which had taken it from the religions which formed the milieu of its early life, the Greek, Jewish, and Roman, in which it was invariably used with reference to cult, having no secular significance whatever. To understand the meaning of the word we must turn to these three religions.

RELIGIOUS BACKGROUND

Sacrifice comes from the Latin noun *sacrificium,* and the verb *sacrificare,* which are blanket terms for any religious act in which a thing is made sacred, that is, given to a deity and made his property. If that which was made sacred was an animal or a cereal for the purpose of preservation of the life power of the deity and thus keeping him favorable, it was burned in order that the food, sublimated into smoke, might rise to the upper air where the deities lived. A handful of food thrown into the hearth fire by the father of the family at a meal was a *sacrificium.* Instruments used in the process of public sacrifices, temples where the process was carried on, and articles of adornment of the temples were likewise made sacred. Rites of lustration or purification with the purpose of warding off demons and evil influences were also called sacrifices.

The rules and ceremonies for these rites were meticulously preserved from early days in the *jus divinum,* which was the body of regulations for

keeping people in the good graces of the gods, as the *jus civile* prescribed the regulations for keeping them in the good graces of the city or state.

Greek Rites.—The Greek language had no such blanket term to describe religious rites. Rites in honor of the deities of the upper air (Olympus) were called *thusiai;* those offered to chthonic powers were called *sphagia.*

Thusiai.—Thusiai were always offered by daylight, preferably in the morning. Certain parts of the victims, the steaks, were burned on a *bomos,* a large stone or a pile of stones raised higher than the worshipers; the remainder was eaten by the worshipers as part of the rite. The act of burning the flesh for the deities was *thuein* or *hiereuein.* The rites were concluded by music and dancing. Their purpose was to honor the friendly deities.

Sphagia.—Sphagia were offered by night. The rite was described by the verbs *sphagiazein* (to slaughter), *enagizein* (to make taboo), and *holokautein* (to burn wholly). The victims were burned on an *eschara,* a rude stone laid as close as possible to the ground or in a trench dug for the purpose. None of the animal was eaten, and the whole eerie rite was performed in silence. The purpose was placation or aversion of unloved powers.

Our translations of all these Greek words have come through the Latin and have lost the sharp distinction between the rites. *Thusiai* and *sphagia* have both become *sacrifices;* all the words describing the rite have become *to sacrifice; bomos* and *eschara* have both become *altars.* The result is that we hear of two kinds of Greek sacrifice, thus confusing rites which should be sharply distinguished.

Jewish Rites.—Jewish rites were likewise described by different vocabularies, with no blanket term to group them together.

Zevach and 'Olah.—The best known was the *zevach,* which was, in most ways, a counterpart of the Greek *thusia,* by which it is translated in the Septuagint. In Judaism, after the return from the captivity, the *'olah* gained increasing significance. In this rite an animal was wholly burned on an altar, and none of it was eaten by priest or people. This was not a rite of aversion or placation. As the smoke of the *zevach* carried the choice parts of the victim to the sky, where Yahweh lived, and was thus an offering of the best part of the food to the deity, the *'olah* was considered as offering the whole animal to the deity, thus becoming the greatest possible gift which could be offered. Long after Yahweh was considered to have no physical form, both these rites were continued with increasingly analogical interpretation.

When the Hebrew Bible was translated into Greek, *zevach* was easily rendered by *thusia.* Translation of *'olah* gave difficulty. All Greek rites in which an animal was wholly burned were rites of placation and aversion but *'olah* was honorific, and could not be rendered by *holocauton.* The translators ingeniously coined other words from the same Greek roots, but differently spelled and with slightly different endings. When the Greek Bible passed into Latin the distinction was lost. Latin had no rites equivalent to Greek *holocauton,* and the Greek was latinized into *holocauston* (wholly burned). This came into the Douay version as "holocaust." The King James version tried to remedy this by coining the compound word "whole-burnt offering."

Pesach.—The oldest sacrificial rite continuing to the present day is the Jewish annual Pesach (translated "phase" and "pasch" in the Douay version and as "passover" in the King James version). It preserves the primitive communal meal, with no burning of any part on an altar by priests. The blood of the animal was smeared upon the door posts of the house where the rite was performed, as a prophylactic against dangerous misfortune.

Purification Rites.—In addition to these sacrifices, Judaism had many rites of purification, which probably arose from taboo rites; one could not worship if he were taboo, and the taboo had to be solemnly removed before one could participate in worship. Judaism early extended its taboos to include moral disqualifications. Underlying all those rites was the fundamental principle that sacrificial worship was an act of the group and not of an individual *per se.* Therefore every individual in the group, as well as the group as a whole, must be free from physical and moral taboo, whether conscious of it or not. The place of worship, the altar, must likewise be certainly free from deliberate or accidental contact which it might have had with a taboo person.

The common method of purification was smearing or sprinkling with blood, the principle of life. This might be performed as a special act, but it was always a necessary preparation for offering a sacrifice. The natural source of the blood was the animal to be sacrificed.

Sacrifice as Worship.—These rites would be better understood if the word *sacrifice* were confined to the rites of worship as the solemn acts for which purification was a necessary preparation, and in which some solemn act was performed with an animal which had been killed for the purpose.

Animal Sacrifices.—The death of the animal was an incidental, necessary fact in order that the sacrifice might be performed; it was not a factor of the sacrifice. The death of all individual animals or cereals which we eat is still a necessary fact or event occurring either before or during the process of eating the food; it cannot be regarded as a factor of the meal. Thus the death of the animal was never on the altar. For obvious physical reasons the beast was slain as near the altar as was in keeping with whatever reverence accompanied the sacrifice. After the victim was killed there were three possibilities for disposal of the carcase. (1) The worshipers might eat all of it. (2) They might eat part and sublimate part into smoke for the gods. (3) They might burn all of it.

The Offering Devoured.—The first method was that of the Jewish Pesach, the Greek *bouphonia,* the strange rite of the 'Aisāwa, a Moslem fraternity in Algeria [described by Theodor Nöldeke, in "Arabs (ancient)," *Encyclopaedia of Religion and Ethics,* vol. 1, p. 665b], and in many other primitive rites, all of which had their origin in days before men had any concept of deities. The common meal of the early family or clan or tribe was the method by which the life power and the qualities of the animal were appropriated by those who participated in the feast. Totemistic concepts of "eating the god" may well have contributed to the development of the rite.

Partial Sublimation.—With the growing conviction that the mysterious life powers, which men wanted to appropriate, were sentient beings, it was simple to picture the smoke of their roasts ascend-

ing to those beings. It was but a step to the conviction that a portion of the meat should be sent up to the gods. Thus may well have arisen the regular, official sacrifices which we see most highly developed among the Greeks and Hebrews, the *thusia* and the *zevach.* In both these sacrifices the idea of thanksgiving was highly developed, expressed in Greek by the word *eucharistia,* which passed into Christianity.

We are able to reconstruct the ritual acts of both Greek and Hebrew sacrifices which were remarkably similar. In both were three distinct parts, the preparation, the sacrifice proper, and except in the *'olah,* the meal, accompanied and followed by music.

In both religions the preparation consisted of purification from normal and accidental uncleanness from daily living and from acts and crimes which constituted barriers to worship. In Greek rites this was accomplished by lustration. In Jewish rites it was accomplished by manipulation of the blood of the victim, and included the altar as well as the worshipers. At the end of these rites the animal was killed and dissected. In Jewish rites this killing was prescribed to be done by the worshiper.

The priests then performed the sacrifice itself by burning on the altar the choice parts of the flesh of the victim. Homer gives elaborate descriptions of this in two places in the *Iliad,* and two in the *Odyssey,* with almost identical words in all four. The sacrifice (except, of course, the *'olah*) was followed by the meal for which meticulous rules are prescribed in Greek inscriptions. For large, official sacrifices the music was as elaborate as possible. The aim was always to make the sacrifice as large as possible, with as many victims as could be provided.

Total Sublimation.—From biblical Judaism comes the sacrifice in which none of the victim was eaten. The animal was flayed because his hide was the perquisite of the priests in both Greek and Jewish sacrifices. The burning of all the remainder upon the altar lent itself easily to lofty spiritual interpretation.

Decline of Sacrifices.—There was no possible connection between this whole-burnt offering and the Greek aversion and placation rites to which reference has been made. With the destruction of the Temple in 586 B.C. Hebrew sacrifices came to an abrupt conclusion. The priests and the better part of the people were banished to Babylonia. They were convinced that no Jewish sacrifices could be offered outside the Temple in Jerušalem. Judaism became a sacrificeless religion until the return from the captivity and the building of a second Temple more than a century later. During this time the tradition of the sacrifices and their ritual were reduced to writing in the Pentateuch (Torah) which forms the sole early source for study. No one knew when sacrifices had been introduced. Many of them probably came from the Phoenicians who built the Temple for Solomon.

All Jewish sacrifices must be accompanied by an offering of cakes of fine flour called the *minchah,* translated in the Douay version as "oblation of sacrifice," in the King James version as "meat offering," and in the Jewish version as "meal offering." In certain instances this could even be substituted for an animal sacrifice.

With the establishment of synagogues in Palestine after the return from the captivity and the dispersion of the people into distant lands, it became increasingly difficult for a Jew to go to Jerusalem where alone sacrifices could be offered. Pious folk who could afford them might make occasional pilgrimages, but, for the greater part of Judaism, sacrifices were impossible. They learned to content themselves with prayer, fasting, almsgiving, and reading of the Torah as adequate surrogates for sacrifice. Thus, by the time of Jesus, Judaism had been largely weaned from this worship. With the destruction of the Temple in 70 A.D., Jewish sacrifices were brought to an end. Greek sacrifices took another two centuries to peter out.

Latin Sacrifices.—Latin sacrifices were of an entirely different kind. Latin deities were not so clearly developed personalities as Greek gods and the Hebrew Yahweh. Native Latin rites were strongly influenced by the Etruscans who may originally have come from Babylonia. One can find in Latin sacrifices a strong resemblance to those of Babylonia in the importance placed upon study of omens.

The Study of Omens.—Babylonia: In Babylonia the study of the configurations of the liver seems to have been the principal reason for religious slaughtering of animals. The will of the gods could be ascertained by careful study of the contour and markings of a sheep's liver. Babylonian tablets abound in meticulous directions for this study. For removal of the liver the animal had to be killed. Once more the death of the victim was a fact but not a factor of the rite. After examination of the liver, some disposition of the carcase had to be made, and this disposition developed into elaborate rites. All of this is reflected in Latin rites.

Among the Greeks and the Jews: In Greek sacrifices the killing of the animal afforded a good opportunity to examine the organs for omens. This examination was usually an incidental accompaniment of the rite and not the primary purpose of it. The Jewish law positively forbade liver omens of any kind.

Rome: Among the Romans the primary purpose of the rite was for the study of omens shown by the *exta,* the name given to the organs below the diaphragm. The animal, adorned with fillets and ribbons to mark it as holy, was led to the altar, where it must go willingly; it was further sanctified by sprinkling pieces of cake and pouring wine upon it. After the animal was killed, the *exta* were dissected, carefully examined, cooked, and laid upon the altar fire with selected pieces of flesh. The remainder of the flesh lost its sanctity and became the property of the priests. The whole sacrifice was performed in silence, save for weirdly playing pipes to drown other noises.

The burning of the *exta* was a necessary sequel to the examination for omens. These organs had been used for a solemn purpose and could therefore be used for no other. With the rise of the concept of deities, the examination for omens could well be interpreted as learning the will of the god; the burning of the *exta* would be sending them up to the god. The addition of pieces of flesh marked a definite offering of some kind.

The normal Latin sacrifice had no common meal. A very few minor rites are found in which such a meal was eaten but these rites were not encouraged by the *jus divinum* and were in no way official. The gladness, joy, and thanksgiving which marked Greek and Hebrew sacrifices were no part of Latin rites. When Latin became the chief language of the Mediterranean world the

same *sacrificia* was employed to describe all other rites, even though they were totally different in purpose and technique.

ORIGIN AND DEVELOPMENT OF SACRIFICES

Much that has been said of the origin of sacrifice has been marked by the confusion of thinking which came from Latin use. It is impossible to group together honorific rites with glad thanksgiving, aversion rites with weirdness and horror, omen rites and purification rites, and try to find a single origin for the whole conglomeration.

Causations.—Fear of misfortune, taboo, and demons may well explain most of the aversion rites, and may have given rise to many of the purification rites, while omen rites, desire to learn the will of the gods, may have descended from methods of gratifying the natural desire to probe the future. Omens were derived from those phenomena unexplainable by known causes. The deities as the life powers were naturally regarded as the ultimate cause of these phenomena and might well reveal their plans by the markings of the liver which, as its name in English indicates, was supposed to be the seat of the life-soul because it is the bloodiest organ of the body. The "gift-theory," proposed by Edward B. Tylor in *Primitive Culture . . .* , 2 vols., 5th ed. (London 1929), may well explain the continuance of sacrifices and their development. It does not explain their origin which antedates any concept of deities. Men were led by worship to know their deities; they did not invent worship because they believed in deities.

Totemism.—Totemism, studied in detail by James George Frazer in *Totemism and Exogamy . . .* , 4 vols. (London 1910), and *The Golden Bough, a Study in Magic and Religion,* 12 vols., 3d ed. (London 1911–1926; reprint 1951), may well have marked the first clear step toward the idea of a worshiper's appropriating the power of the deity within himself, as seen in the rites in which the victim was wholly eaten. However, we have not solved the problem of how totemism arose. We realize also that totemism makes no contribution to the origin of the better known and more regularly observed sacrifices.

The only common origin of sacrifice, omen rites, and rites of purification and aversion, seems to have been primitive man's conviction that, in addition to the physical objects which formed his environment, there were invisible and unpredictable powers which made themselves known through those physical environments. Some of these seemed friendly and some inimical. One kind of rite tried to establish union with the former; a totally different kind tried to banish the latter.

Classification.—When W. Robertson Smith, in lectures on the *Religion of the Semites,* 3d ed., pp. 421 ff. (London 1927), classified sacrifices as (1) of tribute, (2) of communion, (3) piacular (expiatory), and (4) substitutionary, he was using sacrifice in the Latin sense, and continued the confusion by including in number (4) the rites of the Day of Purification which were held in the early part of the Jewish New Year by purification of priests and people of all unconscious sins of the year passed.

Day of Atonement.—The name, Day of Atonement, uses a 16th century word to translate Greek and Hebrew words which described purification, but had no suggestion of reconciliation. On that day alone the sins of priest and people were solemnly transferred to the scapegoat which was then not sacrificed, but driven "into the wilderness" by acolytes who had to be purified from their contact with the sin-laden beast.

Here was the only instance in which the "laying on of hands" was specifically interpreted. This was probably because the meaning was different from the customary use of the term. In every Jewish sacrifice the worshiper had first to lay his hand upon the beast before he killed it. This is never explained as transfer of sins; it was probably a means of some sort of identification of the worshiper with the victim, which was to be offered, at least in part, to Yahweh.

Christian Concepts of Sacrifice.—The Greek word *thusia* was used by early Christians to describe the work of Jesus, the ideal of Christian living, and the Eucharist, which was always the great act of worship of Christians until the 16th century and has continued so in the Roman, Orthodox, and Anglican communions. When this word was translated into Latin as *sacrificium,* the confusion of thinking commenced which has marked many Christian writers. The confusion was worse complicated by the assumption that the death of the victim was a factor, as well as a fact, in the sacrifice. This was climaxed by identifying the sacrifice solely with the death of Jesus. This was possibly the unlucky first step toward the modern concept of sacrifice as the very reverse of what it was in days when its significance was solely cultic.

Animal sacrifices were always, at best, bulky, clumsy, and dirty. It is small wonder that they passed out of existence. It is also small wonder that Christian ideals and worship were interpreted as the spiritual fulfillment of these rites, and that Judaism found in fasting, almsgiving, prayer, and reading of the Torah a similar fulfillment.

SACRILEGE, săk'rĭ-lĕj, the profanation of a holy place or holy thing, and by extension of meaning, any act which blasphemously misuses or desecrates divine things, names, persons, or places. The origin of sacrilege as a quasi-legal term is in the Code of Justinian, which made robbery from churches a crime punishable by death. The concept, however, has earlier sources in regulations, such as those in the Greek temples and in the Temple in Jerusalem, where trespass on holy ground was sacrilegious and punishable in some instances by death. Only since the 19th century has the legal treatment of profanation of church buildings and associated crimes been similar to that of other more secular offenses.

Apart from the strictly technical sense of sacrilege as profanation, there is the extended meaning which is nearly synonymous with blasphemy. Here too there have been special legal enactments to punish misuse of the name of God or the Holy Communion, although in recent years there has been some relaxation in enforcement.

In Great Britain it is still a sacrilege to employ the name of God on the theatrical stage, while in the United States several famous cases in law have arisen from purported sacrilegious dramatic productions.

W. Norman Pittenger,
Professor of Christian Apologetics, General Theological Seminary.

SACRISTAN, săk'rĭs-tăn, an officer of the church, in charge of the sacristy and the sacred objects in it, particularly in Roman Catholic and Episcopal (Anglican) churches. The term derived from the medieval *custos ecclesiae,* whose office included guarding the sacristy and the sacred vessels and vestments used in divine service. It has fallen into desuetude in those Protestant churches where the service is simplified, often to the point of extinction, so that the duties of sacristan have largely disappeared. In these churches his place has been taken by the *sexton* (a corruption of *sacristan*), whose function corresponds more to that of general caretaker, while the duties of the modern sacristan remain similar to those of the medieval *custos.* In cathedrals and collegiate churches the sacristan is always in holy orders, but in smaller churches his place is usually filled by a layman. See also Sexton.

SACRISTY, săk'rĭs-tĭ, a room, in ecclesiastical architecture, in or attached to the church, where sacred vessels and utensils are kept, and where the clergy vest for divine service. The sacristy is now used primarily in Roman Catholic churches, and in those Protestant churches which conduct an elaborate ceremonial. Reformed churches, which maintain a simplified service and use few holy objects, have no sacristy, and its place is taken by the vestry.

SACROBOSCO, săk-rō-bŏs'kō, **Johannes de** (also John of Holywood, or of Halifax), English mathematician: b. probably Halifax, England, near the end of the 12th century; d. Paris, France, 1256. Sacrobosco is thought to have studied at Oxford University, going to Paris to teach about 1230. He was one of the first medieval scholars to make use of the mathematical writings of the Arabians. His fame rests principally on a small work, *Tractatus de sphaera mundi,* which paraphrases some of the more elementary ideas of Ptolemy, and of the Arabian astronomers al-Battani and al-Farghani. The *Sphaera mundi* had great popularity during the Middle Ages, although it was completely inoriginal, and as late as the 17th century it served as a basic text for teaching astronomy. It was the second astronomical work to be set in print (Ferrara 1472), and by 1669 had appeared in many subsequent editions, often with commentaries by the most distinguished scholars of the time. Sacrobosco was also the author of a work on arithmetic, *Algorismus.*

SACROILIAC, să-krō-ĭl'ĭ-ăk. Relating to the sacrum (q.v.) and ilium—the articulation between them and the associated ligaments. See also Pelvis.

SACRUM, să'krŭm (Lat. *os sacrum,* sacred bone), bone found in all vertebrates, at the lowest extremity of the spinal column. In man the sacrum lies between the last lumbar vertebra above, the coccyx below, and the coxae on either side, thus closing the posterior wall of the pelvic girdle. The point of junction between the sacrum and the coxae (ilia) is known as the sacroiliac joint. The largest bone of the spine, the sacrum is composed of the five (sometimes six) sacral vertebrae, which, in the adult, fuse into a single wedge-shaped bone, broad at the top (*base*), and tapering down to the narrow *apex.* The anterior surface, smooth and concave, is cut in the middle by transverse lines, where the vertebrae have welded. The posterior surface is rough and convex, ridged by five vertical projections. The center ridge, which is most protrusive, results from the fusion of the spinous processes of the sacral vertebrae forming the sacrum. The fifth vertebra, however, has no spine. The sacrum of the female is shorter, proportionately broader, and has a flatter curve than that of the male. The sacrum of human beings has greater relative breadth than that of lower vertebrates, in whom the number of sacral vertebrae varies from two to nine.

SACY, să-sē, Baron Antoine Isaac Silvestre de, French Orientalist: b. Paris, France, Sept. 21, 1758; d. there, Feb. 21, 1838. The son of a notary, de Sacy received a thorough education in Greek, Latin, Hebrew, and the modern Oriental languages; but from 1781 to 1792 he was professionally connected with the Cour des Monnaies, pursuing his scholarly interests privately. Despite his outspoken Monarchism, he was appointed professor of Arabic at the Ecole des Langues Orientales Vivantes in 1796, and in 1806 became professor of Persian at the Collège de France. De Sacy held numerous positions; among these were translator for the government, member of the legislature from 1808, royal censor under Louis XVIII, rector of the University of Paris, administrator of the Collège de France, director of the Ecole des Langues Orientales, curator of Oriental manuscripts in the Bibliothèque Royale (now Bibliothèque Nationale), and member of the commission for public education. In 1833 he became perpetual secretary of the Académie des Inscriptions et Belles-Lettres. Napoleon I created him a baron, and Louis Philippe made him peer of France. Indefatigable in editing and translating Arabic and Persian manuscripts, de Sacy was particularly successful in the field of Arabic literature, in which he translated works of prose, poetry, history, geography, numismatics, and science. To his translations, which were noted for philological exactitude, he appended voluminous critical notes, which, by careful use of source material and a deep fund of personal knowledge, were often more valuable than the text itself. His fame as a teacher was enormous; Orientalists throughout Europe, came to study with him, and his pedagogical theories had widespread influence. De Sacy was a pioneer in the methodical study of Arabic and other Oriental languages, and so, by extension, enlarged the entire scope of modern historical scholarship. His principal works include: *Principes de grammaire générale* (1799); *Grammaire arabe* (1810); *Chrestomathie arabe . . .* (2d ed. 1826); *Exposé de la religion des Druzes* (1838).

SADDLE, a seat for a horse's back, contrived for the safety and comfort of the rider. In early ages the rider sat on the bare back of

his horse, but in course of time some kind of covering was placed over the back of the animal. The modern riding saddle consists of the tree, generally of beech, the seat, the skirts and the flaps, of tanned pig's skin, and the construction and weight vary according to the purposes for which it is to be used. Among the varieties are racing saddles, military saddles, hunting saddles and side saddles for ladies. The name saddle is also given to a part of the harness of an animal yoked to a vehicle, being generally a padded structure by means of which the shafts are directly or indirectly supported. It is further applied to the support of a rod in machinery or of a spar of a ship.

SADDLE MOUNTAIN, Mass., the chief group of the Taconic Mountains, in the northern part of Berkshire County, four miles southeast of North Adams, and containing Greylock Mountain, the highest peak in the State, 3,535 feet in altitude.

SADDLE REEFS. During the process of folding an anticline the beds at the crest or apex of the fold sometimes tend to open or separate just as a pack of cards might do when bent sharply. If these openings become filled with mineral matter they form a special type of veins which are known as saddle reefs because of their saddle shape. Certain veins of the Nova Scotia gold field and of the Bendigo gold field in Australia are of this type.

SADDLEROCK OYSTER, a large and favorite kind of oyster originally obtained from a reef known as Saddle Rock near Norwalk Harbor, Connecticut. The supply was exhausted early in the last century, but in the first attempts at artificial cultivation of oysters (q.v.) in the eastern part of Long Island Sound many small "seed-oysters" were derived from that district, and so the name continued until it became a market term about New York for large and well-shaped oysters mostly sold to be eaten raw.

SADDUCEES, a sect or party of the Jews during the last three centuries preceding the fall of Jerusalem and the end of the old Jewish state (70 A.D.). The history of the party and the facts as to its constituency, beliefs and practices are only imperfectly known. The statements in Josephus and the New Testament, our most important evidence, are not altogether satisfactory. The New Testament writers may have been indirectly influenced by Pharisaic prejudice, while Josephus, writing to please and interest Greek and Roman readers, limits himself to a few somewhat general and not altogether consistent observations. In the New Testament the Sadducees are linked with the Pharisees as opponents of Jesus (Matt. xvi, 1, 6, 11, 12, etc.); they are said to have denied the resurrection of the body (Matt. xxii, 23ff and parallels), also the existence of angels or spirits (Acts xxiii, 8). As influential pri ts and members of the Sanhedrin the Sadducees officially opposed the early preaching of the Apostles (Acts iv, 1; v, 17). They sat side by side with Pharisees in the Sanhedrin or Supreme Council of Judaism (Acts xxiii, 6ff), although the two parties were hostile to each other.

Josephus ('War,' ii, 8, 14; 'Ant,' xiii, 5, 9; 10, 5f; xvii, 2, 4; xviii, 1, 2f; xx, 9, 1) tells us that the Sadducees did not believe in fate (i.e., Providence) nor in the immortality of the soul. They emphasized human free will and responsibility and were more austere and inclined to severity in judgment than were the Pharisees. They rejected tradition and held the written law alone to be authoritative. They belonged mainly to the more wealthy and aristocratic circles and were not influential with the mass of the people. Josephus, doubtless, knew more about the Sadducees than he set down in his writings. It must be remembered that the evidence of both Josephus and the New Testament holds good mainly for only the very last period of Jewish history when these Sadducees were only a shattered remnant of a once great and powerful party. There is no trace of any distinct parties in post-exilic Judaism until about 180 B.C. when the close contact with Hellenism consequent on the Seleucid supremacy over Palestine, led to an ardent Hellenizing propaganda and consequently to a cleavage of the Jewish community into two factions, the conservative and the radical or Hellenistic. But it is a mistake to identify the Sadducees with the latter, who were willing to sacrifice even the law itself in favor of conformity to Greek ideas and practices. The conservatives stood for steadfast loyalty to the law and Jewish customs and prejudices. But within the conservative ranks — which comprised th majority of the people — two tendencies were operative. Some, with loyal acceptance of the law and reverence for it as the supreme religious authority, were content with the Law as written. They opposed an accumulation of traditional interpretation as authoritative. Dogmas not explicitly taught in the Law might be refused assent. On the other hand were those who sought to make the Law ever more comprehensive and universally applicable through exegesis or interpretation. Such interpretations became an ever-enlarging body of *tradition* as binding as the Law itself. This was the party of the *Scribes* — ardent students of the Law — while the other tendency was mainly represented by the priests and aristocracy. The scribal position was essentially that Israel was fundamentally a *church* — a religious organization; the opposite position allowed full room for the conception of Israel as a political entity — a nation among the nations of the world. In the reorganization of the Jewish state under the Asmonean priest-princes (142–63 B.C.), the party of the scribes became definitely organized as the Pharisees. The group or party opposed to the Pharisees were known as the Sadducees, probably because so many of the Zadokites (i.e., the priestly aristocracy, cf. Ezek. xliv, 15f.) were among its influential members. There is no evidence, however, that these were so strictly organized as was the case with the Pharisees (q.v.). In general, the Asmonean rulers were inclined to favor the Sadducees. The Pharisees thus became the party of opposition.

The non-priestly aristocracy also generally sided with the government, that is, were counted as Sadducees. The numbers of this generally patriotic, conservative party were sadly diminished in the civil strife preceding the Roman occupation (63 B.C.) and in the wars between Herod and Antigonus, the last Asmonean prince. Its representation in the Sanhedrin was reduced and its hold on the people greatly dimin-

ished. In Herod's later years the party seems to have bettered its condition but it never again recovered its earlier power and influence. As a party it ceased to exist with the fall of Jerusalem, 70 A.D., and the complete disorganization of Judaism that ensued. The view advocated above is somewhat different from the traditional one which takes the Sadducees to have been, as a party, somewhat irreligious, inclined to Hellenism, worldly and with little reverence for the Law and sacred things in general. That some Sadducees were such is probably true, but it certainly is not correct to so characterize the party as a whole.

The Sadduciac type of thought is represented in Jewish literature by such works as Ecclesiastes in the Old Testament, by Ecclesiasticus and 1 Maccabees in the Apocrypha, and possibly by the Testaments of the XII Patriarchs and the Book of Jubilees in the Pseudepigrapha. A most interesting Sadduciac work, hitherto unknown to modern scholars, was recently discovered in the Cairo genizah by Dr. S. Schechter and published by him (Oxford 1910) under the title *Fragments of a Zadokite Work*. In this we have evidence of the existence of a reform party or sect within the Zadokite circle which originated about 200 B.C. and was still in existence, hoping for better things, as late as near the beginning of the Christian era, the date of the fragment.

Z., in *Studies in Jewish Literature,* etc. (Berlin 1913).

EDWARD E. NOURSE,
Professor of Biblical Theology, Hartford Theological Seminary.

SADE, säd, **Donatien Alphonse François de,** COUNT, popularly called the MARQUIS DE SADE, French libertine and novelist: b. Paris, June 2, 1740; d. Charenton, Dec. 2, 1814. From the age of 14 to 26 he was in active military service until his return to Paris in 1766 when his immoral life became notorious. At Aix in 1772 he received the penalty of death for an unnatural crime and for poisoning, but escaped to Italy. Returning to Paris in 1777, he was rearrested and jailed in Aix, but again escaped only to be recaught and finally committed to the Bastile where he killed time by writing lewd novels and plays. These include *Justine* (1791); and *Juliette* (1798). He had the temerity in 1803 to address a copy of *Juliette* to Napoleon and was committed to the Charenton Lunatic Asylum where he had spent some time in 1789–1790, and there he died. "Sadism," the diseased condition of sexual perversion with cruelty, is named after him.

SADHS, sädz, or **SAADHS,** sä'ädz, a Hindu sect which believes in one God, and teaches a pure morality. The sect was founded in 1658 A.D. by a man called Birbhan. They have no temples, but assemble at stated periods in houses, or courts adjoining them. They are found chiefly in Farukhabad, Delhi, Mirzapore, etc.

SADI, să-dē', or **SAADI** (real name MUSLIH-UD-DIN), Persian poet: b. Shiraz, about 1184?; d. there, 1291. After completing his studies and spending many years in travel, he settled in the neighborhood of Shiraz, where he enjoyed the favor of several Persian rulers. The Persians esteemed him exceedingly on account of his golden maxims, which they consider a treasure of true wisdom, and also on account of his pure, simple and elegant style. His works comprise (1) a collection (*Diwān*) of lyric poems in the Arabic and Persian languages; (2) *Gulistān* (*Rose Garden*) (1258), a didactic work composed both of prose and verse, in eight books; (3) a work in verse, called *Būstān* (*Fruit Garden*) (1257), containing a collection of histories, fables and moral instructions. The complete works of Sadi were published in Persian at Calcutta (1791–95).

SADI-CARNOT, sä-dē'kär-nō. See CARNOT.

SADLER, săd'lĕr, or **SADLEIR, SIR Ralph,** English diplomatist: b. Hackney, 1507; d. Standon, Hertfordshire, March 30, 1587. He became the ward of Thomas Cromwell, was one of Henry VIII's principal secretaries of state and was appointed by Henry's will one of the council to assist the executors upon whom was laid the government of the country and the guardianship of young Edward VI. He went into retirement during Mary's reign, but emerged after the accession of Elizabeth, and became one of Cecil's agents, especially charged with negotiating Scottish affairs. In 1568 he became chancellor of the duchy of Lancaster and thereafter he was mainly occupied as one of the English commissioners to treat of matters relating to the queen of Scots. In 1580 he was for a time one of her guardians at Sheffield and Wingfield. His last mission was to James VI of Scotland in 1587 to endeavor to reconcile him to the execution of his mother.

SADLIER, Anna Teresa, Canadian author: b. Montreal, Que., 1856; d. Ottawa, Ont., 1932. As the daughter of Mary A. Sadlier (q.v.), she early came in contact with literary matters, most particularly with religious writings. This, in addition to her education at St. Mary's and Holy Cross Seminaries, and Villa Maria Convent, Montreal, directed her into writing, like her mother, on Catholic subjects. She contributed to almost every Catholic publication in Canada, the United States, and Great Britain, and wrote some 20 novels, two books of biography, and a score of translations from the French and Italian. Her novels were didactic, and later generations consider them dull, but there is a distinctive literary flavor in her biographical writing, most acceptable of which is *Women of Catholicity* (1885).

SADLIER, Mary Anne (Madden), Canadian author: b. Cootehill, County Cavan, Ireland, Dec. 21, 1820; d. Montreal, Que., April 5, 1903. She began her literary career while still a young woman by contributing to London magazines. When 24 she migrated to Canada, settled in Montreal, and two years later married James

Sadlier. He was a publisher, and this brought her further literary contacts, not only in Montreal but also in Boston and New York. Mrs. Sadlier was very devout, and spent much time doing editorial work for the Roman Catholic press. She made many English translations of French religious works, and in this helped expand the influence of her church. Her own most important religious book was *Purgatory: Doctrinal, Historical and Political* (1886). Despite this preoccupation with religious matters, she won popular approval with a series of romances of Irish life in America and Ireland, most effective of which was probably *The Confederate Chieftans, a Tale of the Irish Rebellion of 1641* (1859). In the literary circles of Montreal she met the Canadian patriot, Thomas D'Arcy McGee, whose poems she edited with a biography in 1869.

SADO, sä'dō, Japan, an island off the west coast of Hondo, opposite and 32 miles from Nügata, with an area of 336 square miles, and a coast line of 135 miles. It has a diversified surface culminating in Kimpokuzan, 3,820 feet high. South of Kimpokuzan is the town of Aikawa, near the east coast, with the ancient and still productive gold and silver mines in its vicinity, to which Sado owes its celebrity. On the west coast 18 miles distant from Aikawa is Ebisuminato, the port of the island. Pop. of island about 120,000.

SADOLETO, sä-dō-lā'tō, **Jacopo,** Italian theologian: b. Modena, 1477; d. Rome, Oct. 18, 1547. He was consecrated bishop of Carpentras, near Avignon, in 1517; belonged to the Contarini Reform party, and was a member of the commission appointed by Paul III to take steps toward effecting a Church reformation. He immediately opened a correspondence with Erasmus, Bucer, Sturm and Melanchthon, but when in 1539 he invited the Genevans to return to the Roman Catholic Church, he received a harsh rebuff from Calvin. After that he confined himself largely to his own diocese. He had been appointed cardinal in 1536, but while he was frequently summoned to Rome he preferred Carpentras, and his study, well-stocked with books of the new learning, in which he was an adept, being one of the Latinists of his day. He wrote commentaries on the Psalms, and on the Epistles of Saint Paul, and so excellent was their style that Erasmus made the somewhat invidious remark that "their very polish of expression will take off the edge of their pious suggestiveness." His works were published in four volumes in 1734. He was a diplomat in whom successive popes had confidence and acted as ambassador to Francis I in the interests of peace in 1544.

SADOWA, sä'dō-vä (Czech *Sádová*), Bohemia, a village near Königgrätz, on the Bistritz, remarkable as one of the hotly contested Prussian positions in the decisive battle of July 3, 1866, in which the Crown Prince of Prussia and Prince Frederick Charles commanding the Prussians defeated the Austrian forces under Benedek. This battle is known also as the battle of Königgrätz.

SADTLER, Samuel Phillip, American chemist: b. Pine Grove, Pa., July 18, 1847; d. Dec. 20, 1923. Graduated at Lehigh University in 1867 he later studied at the universities of Berlin and Göttingen. He was professor of natural science at Pennsylvania College in 1871–74; assistant professor of chemistry at the University of Pennsylvania in 1874–86, and professor there in 1887–91. He was professor of chemistry at the Philadelphia College of Pharmacy in 1878–1916; and from 1891–1923 was a consulting chemical expert at Philadelphia. He was chemical editor of the *Dispensatory of the United States* (1883–1923), and from 1900 was a member of the committee of revision of the *United States Pharmacopoeia.* Author of *Hand Book of Chemical Experimentation* (1877); *Industrial Organic Chemistry* (1891); and joint author of *Pharmaceutical Chemistry* (1895; 5th ed., 1917).

SAEMUND, sī'mûnd, **Sigfússon,** The Wise, Icelandic scholar: b. Iceland, about 1056; d. Oddi, 1133. He undertook a course of foreign travel in purusit of learning, and visited Paris and Rome; then, returning to Iceland, he became a priest at Oddi (1176). He was unknown to scholars till about 1643, when the newly-discovered *Elder Edda* and other writings were falsely ascribed to him.

SAFE, a strong and substantial receptacle for money, important papers and valuables, usually of iron or steel, or of both combined; sometimes with a filling of concrete to resist heat. A safe, to justify its name, should be proof against fire, explosives, acids, drills, wedges and the other implements and opening devices resorted to by burglars. The great majority of safes are designed mainly to preserve the contents from fire and to resist sneak-thieves. But the larger and most costly safes are built to safeguard the cash and securities of banks, trust companies, etc. The history of the progress of these strong safes is mainly a record of struggles between the burglar and the safe-manufacturer; the result is, that safes can now be obtained which are all but impregnable. With the modern safe of the best kind the lock may be said to be the only vulnerable point; hence much care and ingenuity have been expended on its mechanism. Numerous patents, mostly of American origin, have been introduced in recent years. Of these, the keyless permutation locks deserve particular mention, as they obviate the danger which arises from lost or false keys. Such locks allow of opening only after an indicator has been moved in accordance with a certain combination of numbers arranged before closing the safe. Some safe-locks are so constructed that to be freed they require different keys on different days, some can only be opened at a certain hour, this being fixed on before the door is closed; while others again require two or more keys in charge of different persons; in fact, the arrangement contrived to render the plundering of safes next to impossible are too numerous even to mention. The connection of safes with electric alarms in a variety of ways forms another safeguard. See Vault.

SAFE-CONDUCT, a security granted by the sovereign authority, or persons delegated by it, to strangers or other persons to enable them to repair to and return from a certain place undisturbed. In most of these cases passports have now taken the place of special safe-conducts. Sometimes the safe-conduct is given to

persons accused, to secure them against harm when summoned to an examination.

SAFE INDUSTRY. **History.**—Various methods for the safekeeping of treasure, jewels and other valuables have been in use since the earliest periods in history, and the advancement in this line has necessarily kept pace with increased wealth. Thus we have witnessed the evolution from the old-fashioned strongbox to the massive chilled iron and steel vaults, fire resistive and burglar resistive, until they have reached the highest degree of efficiency and perfection that science and skill can make them. Locks of rude construction were in use by the ancient Egyptians, and by the Romans, during the Middle Ages. The Chinese also used a lock similar in construction to the famous Bramah lock, invented in England in 1784. These were made of wood, the tumblers being of different length to fit the sizes of the wards in the keys. Beginning with the Middle Ages the inventive genius of man was turned toward providing something more substantial than a lock as a method of warding off the burglar, who at that time had not attained to the remarkable skill and cunning of the modern "cracksman," and indeed the professional thief of modern times would look back with envy on his predecessor who had nothing more than a mere wooden box, sometimes bound with iron, with which to cope. The first means of securing valuables was by placing them in some secret cavity in a wall, the door of which was opened by a spring or other device, but more often articles of household furniture were used, such as desks with secret drawers, or tables and chairs with false bottoms. These constituted the chests of the wealthy for some time and some of them were furnished with locks and bound with strips of iron, the whole very artistically made so as to ward off suspicion of their contents. The oaken chest or strongbox, reinforced with iron bands and knees, was in the beginning of the 18th century considered to be the best means of security. Such a chest was used in 1707 to guard the crown jewels of Scotland.

Prior to the 19th century the all-metal safe was unknown. The first improvement along this line was made in France about 1820, consisting of a metal box built within double walls, the space between being filled with a composition of non-conducting substances. A little later a so-called fireproof safe was constructed in New England, considered to be a vast improvement over the existing types. This safe had a body of solid oak plank from three to four inches thick, which, after being thoroughly saturated with alkali, was covered with sheets of thin iron. To make this more surely fireproof, bands of iron were crossed and recrossed over these plates and nailed down with large round-headed iron spikes. The great fire in New York in 1835 proved the worthlessness of these, several hundred of them being then destroyed. The idea of filling in the walls of a safe with non-conducting substances was first put into use in this country in 1843 by Daniel Fitzgerald. His idea was to fill the metal walls of the safe with plaster of paris because of its tendency to throw off heat, and having secured a patent on his invention he immediately began to manufacture a safe known as the "Salamander." His patent was later assigned to B. J. Wildey, who made a safe called "Wildey's Patent," the principle of these being to leave the space between the walls empty, trusting that the contents of the inner portion of the safe would be protected from heat by the non-conducting properties of the air. Other mixtures, such as asbestos, mixed with plaster of paris, clay, alum, fire clay, mica, and chalk, were then used to fill the vacant space, but none of these proved absolutely satisfactory. Today the modern safe walls are filled with a type of material which, when exposed to heat, will generate moisture or steam. Various water chamber devices have also been employed, with a view to maintaining a body of steam between the inner and outer shells of the safe when exposed to a hot fire.

Outside of the fire element, the most important part of the safe to be considered is the lock, for with our modern methods of fire protection the danger of burglary is often as great as possible loss by fire. The first supposedly non-pickable lock was the Bramah, but was finally proved to be valueless and easily picked, this being done by a Mr. Hobbs, by the "tentative process." Three other locks then came into use, the Chubb, also picked by Mr. Hobbs, the Pye lock, invented in 1851, but picked by Linus Yale, Jr., of Philadelphia, by the "impression process," and the Yale lock. Since then many new forms of locks have been invented, and the modern lock combinations are constructed in a manner which has made the trade of burglary extremely difficult.

CONSTRUCTION

There are three ways of procuring security against burglary: first by the laminated construction; second, by the use of blocks of chilled iron, this method being more useful in the construction of large vaults than in the making of portable safes; and third, by the spherical chilled-iron safe. In the first method of construction the chamber is made of alternate layers of hard and soft plates of iron and of plates of hardened steel, the two laid alternately over each other in the walls of the chamber in such a way that they form a single mass. Thus the body of the safe, being constructed of alternate plates of iron, welded iron and steel, carbonized and decarbonized steel, and crystal steel, fastened together by means of bolts from the inside, has made safes practically impregnable to drills, jimmies, jackscrews and other devices. Another method of making safes, in common use by manufacturers, is to roll down together while hot into one solid sheet of tempered steel, three layers of soft iron or steel alternated with two intermediate layers of hard steel. These composite sheets, when they have been rolled until about one-half of an inch thick, are then built into the walls of the safe and alternated with plates of heavy steel about one-half inch thick. The doors are generally the weak point in the construction of a safe, for it is these which a burglar first attacks to see if there is any crevice into which a wedge might be inserted, or any crack into which nitroglycerine or any other high explosive might be introduced. In some safes the plates comprising the door are dovetailed, engaging with the corresponding parts of the jamb; in some an air-tight packing is used between the jambs and their abutments; while in others a screw door is used.

One solid mass of metal is used in the second and third types of safes, the tough and hard qualities of the metal being obtained by modern processes of steel making. The metal used is a soft sheet iron, the surface of which can be hardened by cooling. In the construction of many vaults, blocks of chilled-metal, weighing from three-quarters to several tons, are bolted together on

the inside, the sides being dovetailed together, and the outside surface is chilled to the highest degree of hardness. The door is a single casting of steel, two inches thick, and also chilled on the outside.

In the third type, the spherical, invented by William Corliss, the shell, constructed of steel from four to seven inches thick and chilled to a depth of about two inches, sometimes contains a "bugging" made from a special ore. This material, which is excessively hard and is in appearance somewhat like crystallized silver, is so interwoven with wrought iron rods that it can be battered with immense force without damage. The purpose of this construction of wrought and crystallized iron is to hamper a burglar in his work, it being supposed that in an attempt to drill through the walls of the safe, the drill will penetrate the soft metal more readily than the hard, and, consequently, working sideways, will be broken off when it strikes the hard metal. The "bugging" may, however, be used in precisely the opposite manner, the rods being made of the hardest tool steel and the body of the filling composed of cast iron segments, but the principle of turning the point of the "cracksman's" drill is the same. 30-ton vault door in the Fifth Avenue office of the Manufacturers Trust Company, New York. On its two locks a new combination could be spun every minute for 380 years.

cular door is especially suitable for the spherical safe. They are closed after the manner of the breech block of a large gun, with an interrupted thread or screw.

In large banks and safe-deposit vaults there is no room sufficiently large to contain the number of individual safes which would be required to hold the enormous masses of money and other valuable securities with which these institutions are entrusted. This has turned the attention of the manufacturer in recent years to the building of large vaults which would be fire resistive and burglar resistive. The interior of these vaults may be constructed to suit the tastes and requirements of the owner, but the walls are now made much thicker than formerly and the builder has made more use of fireproofing materials. The most important feature of the modern vault is the lock, which has now reached the acme of perfection. The first form of lock used was the combination lock, an outgrowth of the "tumbler" lock, and the mechanism of these is very ingenious. These locks are not limited in the number of combinations upon which they may be set, and may be changed at any time should the combination become known to undesirable persons. The most valuable asset of the modern vault, however, is the chronometer, or time lock, the mechanism of which is as intricate and as complicated as the best watch, but at the same time it runs as true and as smoothly. To offset any possible disarrangement in the mechanism of a single clock, which would, of course, prevent the opening of the safe, three movements are usually enclosed in a single case. As these safes cannot be opened by any available agency until the time set for the clock to operate the mechanism which swings back the ponderous doors, it is obvious that the chronometer combination is the greatest safeguard against robbery which the bank can employ. The modern safe deposit vault is a vertical strong room, which could be broken into only by the aid of high explosives. See also Lock; Vault.

SAFED, sä'fĕd (Arab. Ṣafad), town, Israel, 2,700 feet above sea level. There is no mention of it in the Bible among the Galilean towns. It was a fortified place during the Crusades. In the 16th century it developed into a famous center of cabalistic studies and became one of the four holy cities of the Jews in Palestine. But at the establishment of the State of Israel in 1948 it had a population of 11,000 of whom two-thirds were Muslim Arabs, practically all of whom have been evacuated.

SAFETY VALVE. See Valve Terms.

SAFFARIDS, să-făr'ĭdz (Arab. Ṣaffārids), a Mohammedan dynasty reigning in Persia for over 40 years. Taking its name from the fact that its founder was, in his youth, apprenticed to a *ṣaffār,* or coppersmith, this minor dynasty has historical significance because it appeared as a national revival within Persia following the Arab invasion of the 7th century A.D., over 200 years earlier, and because it was the first real military challenge from its Muslim adherents to the temporal authority of the caliphate at Baghdad.

Ya'qūb ibn-al-Layth al-Ṣaffār and his three brothers grew up not far from Zaranj, then the chief town of the Province of Seistan, an area which today lies within eastern Iran and southwestern Afghanistan. Tiring of menial occupations, they gathered a robber band which gained dignity by association with the local warriors' guild, a loose grouping of volunteer forces. Eventually Ya'qūb was able to force the governor of the Tahirid dynasty to leave the province and in 861 he became commander of the local forces. Quickly taking over much of the area of present-day Afghanistan, including Kabul and Herat, he moved west toward the heart of Iran to seize the provinces of Kerman and Fars. By 873 he had captured both the Tahirid ruler and his capital, Nishapur. Alarmed by the rising power of this upstart, the caliph found it expedient to name him amir, or governor, over the area of his conquests. Still unsatiated, Ya'qūb marched toward Baghdad but his force was defeated in battle and he retired to the east to consolidate his holdings. Ya'qūb died in 879. A man of very simple habits and tastes, his major interest was in creating an army personally devoted to him. All matters of administration were concentrated in his own hands and, as a result of this policy and the power of his military machine, he left a vast treasure.

'Amr, a brother of Ya'qūb, was proclaimed

the latter's successor by the army. He hastened to tender his submission to the caliph who appointed him governor over the territories ruled by Ya'qūb. His career was a stormy one for he was alternately in and out of favor with the caliph and experienced the relentless enmity of the Tahirids, in spite of the fact that he dwelt in their former capital and was much the stronger. In 898, 'Amr received a decree from the caliph which granted him authority over the vast area of Transoxiana (northeast of the Amu Darya) in place of the current holder, Ismā'īl the Samanid. However, this authority had to be established by force; in the campaigning that followed, his army was beaten and in 900 'Amr himself was taken prisoner. Weak and fallen, he was sent to Baghdad where the caliph had him executed in 902.

For the next decade four descendants of Ya'qūb and 'Amr struggled to maintain authority over a constantly shrinking territory and some years later two other members of the family exerted limited power until about the middle of the 10th century when the line vanished from history.

As military despots of brief authority, comparatively little historical material is available regarding the functions and operations of the Saffarid state. It is known that there were three separate treasuries: that of land revenue was expended for the upkeep of the army; the income from royal holdings supported the court; and auxiliary sources of income were distributed as monetary rewards for services rendered. These hectic years were part of a longer period when local dynasties were waxing and waning, each struggling with one or more of its neighbors. As one among this number the Saffarids should be singled out for their revival of national consciousness and national spirit and for their interest in Shī'ism, the Muslim sect that was destined to win all Iran in a later century.

DONALD N. WILBER.

SAFFLOWER, a large thistle-like composite plant (*Carthamus tinctorius*) with orange-colored flowers, said to have been originally brought from the East, but now naturalized in many parts of Europe and extensively cultivated. The tubular flowerets are collected, dried and used somewhat as a feeble laxative medicine, in place of, or as an adulterant of, saffron. They are, however, chiefly important as the source of carthamin, a dyeing principle originally much employed by the Chinese and later by Occidental silk manufacturers, as it gives brilliant, although fugitive, red tints; mixed with French chalk it forms the cosmetic rouge. In Spain the flowers are used to color soups and other dishes. The Jews in Poland are remarkably fond of the flowers and mix them with their bread and most of their viands. Oil, in India, is expressed from safflower seeds, for culinary and lighting purposes.

SAFFORD, Truman Henry, American mathematician and astronomer: b. Royalton, Vt., Jan. 6, 1836; d. Newark, N. J., June 13, 1901. He was early known as a calculator of great skill; in 1845 he prepared an almanac; by a method of his own he abridged by one fourth the task of computing the rising and setting of the moon, and after his graduation from Harvard was officially connected with the observatory there, 1854–1866. In 1865 he was appointed professor of astronomy in the University of Chicago and director of the Dearborn Observatory; in 1874–1876 he was a member of the United States Coast Survey, and in 1876–1901 professor of astronomy in Williams College. He studied the nebulae, discovering many new ones; computed cometary and planetary orbits and for some time devoted his attention to latitude and longitude work for the United States Corps of Engineers, for which he prepared a star catalogue. Among his further published writings were a catalogue of polar stars, *Mathematical Teaching and its Modern Methods*, and numerous contributions to astronomical journals, to the *Proceedings* of the American Academy, and to the notices of the Royal Society.

SAFFRON, a bulbous autumnal plant (*Crocus sativus*) and a commercial dyestuff obtained from it. The cultivated saffron originated probably in the Levant, and was grown in early times about the town of Corycus, Cilicia (from which the *Crocus* genus may have taken its name). The Arabs cultivated it in Spain about the 10th century, and it was an important crop in England, especially about Saffron Walden, Essex, in the 15th century, bringing the highest market price. It is now raised about the Mediterranean and in Asia. The saffron is low, with the grass-like leaves and long-tubed, funnel-shaped flowers, springing directly from the ground, which are characteristic of the crocuses. Its flower is purple, with a style tipped with three orange-colored stigmas, each more than an inch long, extending from one side of the perianth. These stigmas are picked off in the early morning and dried on a kiln, either loosely or between layers of paper, and under the pressure of a thick board which forms the mass into cakes, about 4,000 of these stigmas being necessary to give an ounce of saffron. In either case the commercial saffron is liable to suffer from adulteration. This adulteration was so prevalent at one time that those guilty of it (when caught) were killed.

Saffron stigmas, when genuine, have a characteristic orange red color and an aromatic, bitter odor and taste. The substance has faint carminative and narcotic properties, but is seldom used medicinally, except for coloring tinctures and occasionally as a diaphoretic in the eruptive diseases of children. In the *Song of Solomon* the saffron is mentioned among the sweet-smelling herbs, and it was much in demand among the Greeks and Latins for its perfume. A fragrant essence was made from it with water and wine for sprinkling in theaters and other places, even in the streets, for anointing the hair and for the bath. Saffron was also much employed in culinary operations, chiefly for its aromatic taste and for coloring, as the clown in the *Winter's Tale* says he "must have saffron to color the warden pies."

Saffron, however, is most commonly used as a dye, giving a yellow hue to cloth, but it is being displaced by cheaper colors. This tint was in very early times the royal color in Greece, and was that of some of the women's court robes, but afterward appropriated by the hetairae. In Ireland and the Hebrides it was also the color of the king's mantle and of the shirts of persons of rank. Saffron enters largely into the composition of the sacred spot

on the forehead of a Hindu pundit. An extract made from saffron, used as a glaze on tinfoil, imitated gold in mediaeval illuminations, and was also employed by painters.

HELEN INGERSOL.

SAG HARBOR, village, New York, in Suffolk County; at sea level; on Gardiners Bay, an inlet from the Atlantic Ocean; 99 miles east of New York; on modern highways. Situated in a farming section, with diversified crops and a large potato acreage; it has also various industries, including watch cases and knit goods; and is a famous summer resort, with fine bathing beaches, and a harbor affording excellent anchorage for yachts. There are a public library; and a whaling museum, containing a collection of equipment used in the trade. The Masonic Temple is a beautiful building, dating from 1845, and reflecting in its architecture the Greek influence of the period; and there is a whalers' monument, erected to the memory of the men lost at sea in the days when Sag Harbor was an important whaling port. The height of the whaling activity here was between 1840 and 1860, when the fleet numbered about 70 vessels. It has a mayor and board of trustees. Pop. (1940) 2,517; (1950) 2,373.

SAGA, city, Japan, capital of the prefecture of Saga, on the island of Kyushu, 43 miles northeast of Nagasaki. It is a minor seaport and commercial center. The town is intersected by numerous streams, chief of which is the channel of Sentonofutsi, 50 miles long. It unites the Gulf of Shimabara with the Northern Sea, and is of some importance as a manufacturing center and also as a distribution point for coal, camphor and rice. There are cotton mills and ironworks. Saga was formerly the capital of the feudal province of Hizen, which comprehended the present prefectures of Nagasaki and Saga. Pop. (1947) 64,978.

SAGA. The word saga is cognate with German *sage,* "a short tale," with which, however, it must not be confounded in meaning, and with English *saw,* "saying." In its limited and original meaning and without qualification, a saga is a story or group of stories in prose, of an historical character, relating in a series of episodes the whole life-history of a Scandinavian hero and written down in Norway or, mainly, in Iceland during the Middle Ages. The historical events which the sagas narrate took place mostly in the period which extended from the date of Iceland's settlement in 874 to the middle of the 11th century. That was the heroic age of the Icelandic people. At first the sagas were nothing but oral transmissions from one tale-teller to another. Their composition began about the middle of the 12th century and lasted for about 100 years.

In a wider sense the word saga is applied to any narration of events of the past, mythical as well as historical in character, but possessing the traits of the genuine saga. In these tales some legendary champion, from whom the saga takes its name and around whom the important events are centered, is the hero. Heroic achievement and marvelous adventure, fact and fancy, are mingled freely. In the course of generations the saga undergoes important changes, acquires accretions and takes on a more or less poetic and artificial character. Finally it is consigned to writing and handed down as a kind of rudimentary epic. When applied, as they frequently are, to works of that kind, in which the historic element is found in greater or less degree, the words saga, myth, legend, Märchen, epopee and epos are used without clear distinction of meaning.

In the third and last stage of its development, the word saga has come to mean any free creation of the popular fantasy, sometimes incredible or even burlesque in character. Here the historical element is entirely lacking. In its widest sense, saga is sometimes used to include the entire body of the history and mythology of a people, or their literature or some division of it: hence we read of the Norse, German, Irish, or Greek sagas; of saga poetry, saga cycles, heroic sagas, beast-sagas, the Cuchulainn saga, the Karl saga, the Njals saga. In Norse mythology Saga is also the name of a goddess.

The Icelandic sagas may be classified: (1) geographically, according to the part of the country in which they arose or in which their scenes are located; (2) as major or minor sagas, the latter being more distinctly local in character and simpler in plot and interest than the former; and (3), as here, as (a) historical, (b) mythical, or (c) romantic. To the class of historical sagas belong: The well-known *Landnamabók, Book of Settlements* which contains a list of all the notable men who, up to 930, settled in the island. It contains much that is valuable on the religion, laws and customs of the people. It is preserved only in a version dating from the 13th–14th century. The *Islendingasögur,* which embody the lives and achievements of celebrated Icelanders and the fortunes of great Icelandic houses from 950 to 1130. The *Biskupasögur* are biographies of Icelandic bishops who flourished in the 11th and 12th centuries; they constitute an ecclesiastical history of Iceland, of less literary interest than the secular sagas but of the utmost historical value.

It would be difficult to say how much is to be regarded as authentic history in *Nóregs Konungasögur,* also called *Heimskringla, World-Circuit,* from the words with which it opens. This was the work of the greatest of all Icelanders, Snorri Sturluson, who was born in 1178 in West Iceland and became distinguished as statesman, scholar, poet and sagaman. It was written about 1230 and gives the history of the kings (chiefly) of Norway. The Icelanders never lost the feeling of connection with the motherland with which their country was in close relations especially in the time of Harald Hárfagri, when Iceland was settled, and of Olaf Tryggvason, when it was converted. The *Heimskringla* possesses all the most excellent features of the best saga art. At about the same time the *Gudhmundarsaga Dyra* was written. Of historical importance also is the *Sturlungasaga,* "the history of Sturla," which is a collection of later *Islendingasögur,* telling of events which happened as late as the year 1250. The tales belonging to this saga arose in West Iceland about the beginning of the 14th century and contain some of the finest narrative passages in the whole body of Icelandic literature. The *Thordharsaga Sighvatssonar* treats of Icelandic history up to the same period. The mythical sagas are those that treat of the old heroic legends, some of which, like the *Völsunga Saga,* which is a prose rendition of the Nibelungen story as given in the Eddic lays, are the common property of all the German peoples, while others,

like the 'Frithjofs Saga,' is particularly Scandinavian.

The 'Fornaldarsögur' "Tales of the Past" deal with the early history of Iceland and are partly of a fairy and romantic character, telling of Viking voyages, love adventures, battles with berserker and monsters. The romantic sagas, as, for example, the 'Riddarasögur,' are mostly translations or adaptations of foreign (chiefly French) courtly epics and romances of chivalry, such as the tales of Troy, of Alexander, Charlemagne, Arthur and the Round Table, Barlaam and Josephat. They were reduced to writing in the 13th century and became favorites in the 15th. They are purely literary and have no historic value. Besides these, which are the three principal classes of sagas, there is a kind called Thättr, which is a short tale treating of a single episode in the life of a distinguished Icelander, and the simplest form of saga. There are also sagas dealing with the Faroes, the Orkneys, Norway, Denmark, Greenland and America. Among the minor sagas may be mentioned 'Gísla,' which is perhaps the most tragic of all the sagas, or at any rate the most conscious of its tragic aim; 'Gretis Saga'; 'Bandamannasaga' ('The Confederates'), which, quite exceptionally, is humorous and the first comedy in western Europe; 'Kormákssaga,' which is very romantic; 'Eríkssaga Raudha' ('The Saga of Erik the Red'), which tells of the discovery, in 982, by Erik, of Greenland and Vineland; his son Leifr discovered the North American coast, probably Nova Scotia; 'Bjarnarsaga,' 'Heidharvígasaga,' 'Víga-Glúmssaga,' 'Vápnfirdhingasaga' and 'Hrafnkelssaga Freysgodha,' which belong to the 12th century; 'Gunnlangssaga' and 'Flóamannasaga,' which were composed in the 13th century; and 'Hítdælakappa,' 'Hænsna Thórissaga,' 'Hardharsaga,' 'Grimkelsson,' 'Gullthórissaga, 'Fóstbrœdhrasaga,' 'Vatzdœlasaga,' 'Svarfdœlasaga,' 'Valla-Ljótssaga,' 'Ljósvetningasaga,' 'Reykdœlasaga,' 'Thorsteins-Hvíta' and 'Droplaugarsonasaga.'

The following four are the greatest of the Icelandic sagas: (1) The 'Eyrbyggjasaga,' which covers a period of about 140 years (890–1030) and was written probably by a cleric about 1225. It is remarkable for the great variety and richness of its adventure and for the light it throws on the manners and customs of the period. Its style is serious, measured and realistic. (2) The 'Egilssaga,' which takes its name from that of the skald (poet) Egill, portrays the life of the 9th and 10th centuries. As his sources, its author made use of oral traditions, other saga material and Egill's own poems and put the whole into writing about the year 1200. (3) The 'Laxdœlasaga' is, for the modern reader, the most romantic and one of the most attractive sagas. The incidents took place between 910 and 1026, and the scene is laid among the people of Laxátals in West Iceland. Here, too, the author, who was also probably a cleric, made masterly use of his sources, some of which may have been Irish, both oral and written. (4) The saga universally recognized as the ripest and most brilliant product of the saga-art is the 'Njálssaga.' It is composed of two originally independent sagas, those of Gunnar and Njál and belongs to the south of Iceland. It is designed on the most liberal scale and is remarkable for the masterly way in which its plot, full of intrigue, love and hate, has been handled, and for its character-drawing and simple and effective style.

In Iceland and Ireland, more than anywhere else in western Europe, story-telling was a necessary part of every assembly. The professional sagaman wandered from place to place, told his stock-in-trade, received entertainment and rewards in return for them and gathered material for new stories. These tales, both those of an historical and those of a legendary character, being of oral transmission, even when later they were thought fit to be consigned to writing, always used the oral saga as a background. Almost all the events narrated in them took place between the years 950 and 1030. That was the Saga Age of Iceland, when life, in a material sense, was almost barbarous and factional fights were of frequent occurrence. The sagaman made most of the abundant stuff at hand for heroic narrative. His heroes are represented as being almost more than human men and women. They belong, for the most part, to the ruling class. The author gives a short account of the hero's family, of his youth and manhood, his loves, friendships and enmities, his great deeds and his death, which was usually of a tragic character. Being based almost entirely on actual happenings and being in close relation to the lives of those for whom they were recited or written, the sagas convey a wonderfully faithful picture of life not only in the Scandinavian world during those centuries but also among the other Germanic peoples who once lived in similar circumstances but have left no such record of their own past.

The very language in which the sagas are couched is greatly conducive to the appearance of reality. It is in prose and very often in the form of dialogue. As the sagaman's main object was to move his hearers, he told his tales in unaffected, straightforward language, the everyday language of the people. Like a dispassionate observer, showing no sympathy with either the events or their heroes, he was content to assemble the incidents and to relate them briefly and restrainedly. The result, however, is much more than a mere impersonal folktale. Even at that early date it is surprising how clearly the essential rules of all good story-telling seem to have been fixed and were observed to perfection; dramatic irony and suspense; the orderly, steady progression of the scenes; the recurrence of personages familiar from other sagas, the chief figure in one becoming a subordinate character in another; the incidental mention of unheroic "mean" details; all this adds to the interest of the saga. One thing the Icelandic sagaman — like the contemporary Irish *sgéulaidhe* — could do supremely well, and that was to tell a story. The Icelandic sagas stand apart at once as a notable phenomenon in literary history and as an absolutely independent creation of the northern mind. See ICELANDIC LITERATURE.

Typus des isländischen Saga' (Leipzig 1877); Golther, 'Nordische Literaturgeschichte' (ib. 1905); Golther, 'Die isländische und norwegische Literaturen des Mittelalters' (Sammlung Göschen, No. 254); Heinzel, 'Beschreibung der isländischen Saga' (Vienna 1880); Olrik, A., 'Nordisches Geistes-

leben' (Heidelberg 1908); Ker, W. P., 'Epic and Romance' (London 1897); Carlton, W. N. C., 'The Icelandic Sagas' (Chicago 1912); Vigfússon, G. (editor), and Dasent, Sir G. W. (translator), Icelandic Sagas and Historical Documents, (Rolls Series, London 1887–94).

JOSEPH DUNN,
Professor of Celtic Languages and Literature, The Catholic University of America.

SAGARD-THEODAT, Gabriel, French Catholic missionary: b. 16th cent. He labored in converting the Huron Indians to Christianity during the 17th century and contributed in an important degree to a knowledge of Canada in its early colonial days as «New France.» His principal works are 'Travels to the Huron Country, towards the Freshwater Sea and the Uttermost Limits of New France, called Canada; Wherein is Treated of all Matters touching the Country, the Manners and Character of the Savages; their Government and their Ways, as Well in their Own Country as when Roaming; of their Faith and Belief; with a Dictionary of the Huron Language' (1632); also 'History of Canada and the Journey Made by the Friars Minor Recollects Thither, for the Conversion of Unbelievers' (1636). An edition of his works was published at Paris in 1866.

SAGASTA, sä-gäs'tä, **Praxedes Mateo,** Spanish statesman: b. Torrecilla de Cameros, 21 July 1827; d. 5 Jan. 1903. He studied at the College of Engineers in Madrid; practised as an engineer in Valladolid and Zamora; in 1854 was elected from Zamora province to the Cortes, where his attitude was a radical one. In 1856 for participation in an unsuccessful revolt he was compelled to escape to France. Upon the proclamation of amnesty he returned, became professor in the Madrid College of Engineering, re-entered the Cortes, was identified with the Progressive minority and edited its journal, *La Iberia.* After the outbreak of 22 June 1866 he again fled to France, but at the beginning of the revolution of 1868 was once more in Spain, where he became Minister of the Interior in the provisional government. In October 1871 he was chosen to the presidency of the Cortes; in December he entered the Malcampo Cabinet as Minister of the Interior; in February 1872 was commissioned to form a new ministry, but in May was forced to resign. In 1874 he appeared anew in office as Minister for Foreign Affairs in the Serrano Cabinet, but shortly afterward exchanged his portfolio for that of the Interior, and in August became president of the Ministry. He retired from office at the accession of Alfonso XII; for a time was a leader without a party; as a member of the Cortes was finally associated with Martinez Campos (1881) in the organization of the new Liberal party, and upon the overthrow of the Conservatives became president of the Ministry. He was forced from power in 1883. Subsequently he was president of the Cortes in 1883–84 and of the Ministry in 1885–90 and 1892–95. In September 1897 he was again summoned to form a cabinet. He recalled Weyler from Cuba, appointed Blanco captain-general and drafted a plan for Cuban autonomy. Although opposed to the war with the United States he waged it with such efficiency as his limited resources would permit and was loudly denounced for signing the treaty of peace. On 4 March 1899 he resigned with his entire cabinet, though on 6 March 1901 he again took the helm and, after averting a Carlist insurrection, remained in office until 3 Dec. 1902. He has been characterized as «singularly devoid of the blind arrogance which has been the bane of so many Spanish statesmen.» After Canovas' death he was conceded to be the greatest political figure of Spain.

SAGE, sāj, **Henry William,** American philanthropist: b. Middletown, Conn., 13 Jan. 1814; d. Ithaca, N. Y., 17 Sept. 1897. In 1832 he engaged in the lumber business which he conducted until 1854, settling at Ithaca, N. Y. He entered the New York assembly in 1847. His earlier benefactions were the endowment of various schools and churches, the West Bay City, Mich., public library, and the Lyman Beecher lectureship at Yale College. In 1870 he became a trustee of Cornell University and his various gifts to that institution were $266,000 for the Sage College for Women; $200,000 for the Sage School of Philosophy; $50,000 for the Susan Lynn Sage chair of philosophy; $260,000 with an additional endowment fund of $300,000 for the University Library Building; $20,000 for the Museum of Classical Archæology; $11,000 for the Sage professorship of philosophy; $300,000 for floating indebtedness. His careful management of timber lands owned by the institution realized for it about $6,000,000.

SAGE, Russell, American capitalist: b. Verona Township, Oneida County, N. Y., 4 Aug. 1816; d. Lawrence Beach, L. I., 22 July 1906. He began life as clerk in his brother's grocery store; entered the retail grocery business for himself in 1837, and during 1839–57 was a wholesale grocer at Troy, N. Y. He was alderman of Troy in 1841–47; treasurer of Rensselaer County, and a Whig member of Congress during 1853–57. In 1863 he removed to New York and shortly began large operations in railroad and other securities. He accumulated one of the largest fortunes in America and was director in many large corporations.

SAGE, Russell, Mrs. (MARGARET OLIVIA SLOCUM), philanthropist: b. Syracuse, N. Y., 8 Sept. 1828; d. New York, 4 Nov. 1918. She was the daughter of Joseph and Margaret Pierson (Jermain) Slocum, and after early vicissitudes graduated at the Emma Willard Seminary at Troy, and became a school-teacher. She taught in schools at Philadelphia, Syracuse and Troy, until at the age of 41 she became the wife of Russell Sage (q.v.), a grocer at Watervliet (then West Troy). Their home life continued simple, in spite of the great wealth which they accumulated, and Mrs. Sage took such deep interest in her husband's affairs that five years before his death he turned over to her complete control of his business and found that his faith was borne out by her successful operations. After his death her life was largely devoted to benevolent work and during the last seven years of complete stewardship of the $70,000,000 left by her husband, she returned nearly $30,000,000 to the public by systematic philanthropies.

SAGE, William, American novelist, son of Abby Sage Richardson (q.v.): b. Manchester,

8 May 1864. He was educated in France and Germany, was engaged in railway and banking business 1881–96, and since then has given his attention to literature. He has published 'Robert Tournay' (1900); 'The Claybornes' (1902); 'Frenchy — The Story of a Gentleman' (1904); 'The District Attorney' (1905); 'By Right Divine' (1907); 'A Maid of Old Virginia' (1915); 'La Belle Yseulte' (1924).

SAGE, a name covering both the common garden herb (*Salvia officinalis*) and other plants of diverse families, somewhat resembling it in color or odor. The cultivated sage is a mint, and the genus differs from the majority of labiates in having two stamens instead of four. It is a native of southern Europe, a shrubby perennial of hoary aspect, bearing rough, wrinkled, gray-green, opposite leaves, on the decumbent stems, and pale-blue, streaked flowers in verticillate spikes at the extremities of the branches. It has been widely cultivated, for at least three centuries, on account of its aromatic odor and bitter, pungent taste. It was formerly used in medicine, having slight tonic, stimulant and astringent properties. An infusion of the plant, or "sage-tea," was drunk in England before the advent of Chinese tea, was a favorite remedy for colds and is even now employed as a gargle. An old English proverb states that "He that would live for aye must eat sage in May." See HERBS, CULINARY.

Many salvias, or sages, are frequently cultivated for their brilliant flowers. The most common, perhaps, are the scarlet sage or salvia (*Salvia splendens*) with racemes, perhaps a foot long, of slender flowers two inches long, arranged in whorls, both calyx and corolla being of a most brilliant scarlet hue; and the equally large-flowered but blue-tinted *S. patens.* The woolly white foliage of *S. argentea* has caused it to be included in gardens, and there are a score of others quite worthy of cultivation for ornament.

Several genera of the *Chenopodiaceæ,* a family which takes kindly to alkaline soils, and which inhabit the desert regions of western North America, are called salt white, or silvery sages. Bitter sages are composites, and are more commonly known as sage-brush (q.v.). The salt sages are species of *Atriplex,* living on thousands of acres of waste lands, which are strongly impregnated with alkali, and so dry that little other vegetation can exist. Since water is so scarce in certain of these alkali deserts, stock cannot be taken into them in summer, and the sages make a good growth, the fruits, valuable for their nutritive qualities, become ripened and the leaves "sun-cured," which, together with the tender spring shoots, make excellent forage, particularly for sheep. The flocks are taken in in winter, when the snow furnishes water for them, and eat the salt-bushes greedily, Nuttall's sage (*A. nuttallii*) being the most valuable, as it is perennial with a deep, woody root, and although cropped, seeds and all, quite down to the ground, survives and starts up again, during the summer, when it is undisturbed. In fact, the constant cropping of these pastures, and the constant manuring, are improving the winter ranges, which are thus becoming nearly as valuable as the summer ones. The white-sage or winter-fat (*Eurotia lanata*) is another highly prized winter forage plant, a foot or more high from a shrubby base, whitened with long hairs, perennial and with abundant fruit, that contributes largely toward the great fattening qualities attributed to this sage, which is also supposed to have a beneficial effect on the grazing stock. The shad-scale, a spiny, shrubby salt-sage (*Atriplex confertifolia*) produces in the spring tender shoots and thick succulent leaves and enormous quantities of flat, winged seeds. These are eagerly sought at the time, and, in the autumn, when leaves and fruit have dropped and been blown into hollows of the plain, the sheep seek them out and devour them utterly.

HELEN INGERSOLL.

SAGE-BRUSH, any one of the species of the genus *Artemisia* — composites very abundant in the arid, alkaline regions of the western United States, where the soil is not too saline, and, with other desert vegetation, covering immense areas. The best-known sage-brush is the common shrub, or bitter-sage (*A. tridentata*), which is found growing on the plains and ascending to the sub-alpine parts of the mountains. It varies in different situations from a dwarfed shrub to almost tree-like proportions, when its trunk near the ground will measure nearly a foot through, being twisted and knotty and loosely enveloped in a light-gray, shreddy bark.

SAGE-BRUSH STATE, or **SAGE-HEN STATE,** a nickname for the State of Nevada, from the large amount of sage-brush growing there.

SAGINAW, Mich., city and county-seat of Saginaw County, on the Saginaw River, 16 miles from Saginaw Bay, 97 miles northwest of Detroit and 65 miles northeast of the capital at Lansing. The railroads entering the city are the New York Central, the Pere Marquette and the Grand Trunk Western. It is also served by a regular air line and by numerous passenger bus and motor freight lines. The city, built upon both banks of the beautiful Saginaw River, here spanned by several highway and railroad bridges, lies at the head of deep-water navigation communicating with the Great Lakes. One of the great cities of the state, it is a city of great beauty and attractiveness; has an ideal climate without extremes of heat or cold, has many handsome residences and ranks well with any city of the United States in the percentage of fine modern homes owned by its residents. Situated on United States highways 10 and 23 and surrounded by an excellent state road system, it is a central point of tourist travel in the state.

Industries, Manufactures, etc.—Industrially the city is fortunate in possessing an immense supply of hydroelectric current, and being the center of the bituminous coal fields of Michigan. Lumber, sand quarries and salt wells also abound, and a productive sugar-beet region is cultivated. Saginaw was at one time the center of the white pine industry, and millions of dollars worth of logs have been floated on the river. This vast industry, through deforestation, has given way to manufacturing, and the city is now distinctively a manufacturing and jobbing center. The principal manufactures of the city are automobile parts, machinery, foundry and iron products, furniture

graphite products, rules and tapes and boilers. About 18,000 persons are employed in industry.

Municipal Conditions.—Ample banking facilities, a city-manager-council form of government since 1936, moderate tax rate, modern civic services of all kinds and other municipal improvements, over 80 churches, are evidence of healthy civic development and growth. Saginaw has a school system which has set and kept pace with other communities. The public and the Hoyt libraries are well-equipped institutions. The hospitals are the Saginaw General Hospital, St. Mary's Hospital, St. Luke's Hospital, and the Saginaw County Contagious and Tuberculosis Hospital. Of interest to visitors are the Woman's Club Building, the statue of Little Jake Seligman, a self-erected memorial to a prominent clothing merchant of the 1890's, the Federal Building, the Hoyt Library (already mentioned), Hoyt Park, Ezra Rust Park, the Butman-Fish Memorial Library, and the Old-Musee-Schuch Hotel, one of the oldest hotels in the state, with its collections of Indian relics, early Americana, and various art objects.

History and Population.—The earliest white men to reach and explore the Saginaw Valley were French Canadians. A fur-trading post was built where the city now stands in 1816 by Louis Campau. In 1818 a council-house was constructed by Campau at the instance of Governor Louis Cass and here on Sept. 24, 1819 the Treaty of Saginaw was concluded between Louis Cass and the Chippewa Indians, which ceded extensive tracts of land to the United States. Fort Saginaw was then built on the west bank of the river, and unrest among the Indians led to the stationing of soldiers there in 1822. The winter of 1822–1823 was so severe that the commander advised that the post be abandoned and in mid-summer 1823 following a fever epidemic the post was abandoned. The settlement grew slowly in the decade that followed and its activities were centered in the fur trade. In 1837 Saginaw was incorporated as a village. The lumber trade brought prosperity to the place and by 1857 there were 14 steam sawmills operating along the Saginaw River. The lumber industry gradually declined with the depletion of the forests but the loss to Saginaw was in great part offset by the discovery of great deposits of bituminous coal, which had been unearthed by salt drillers. In 1890, Saginaw County was the leading coal field in the state. The present city is a consolidation of old Saginaw City, East Saginaw and the village of Salina or South Saginaw. The latter was incorporated as a village in 1866 and became a part of East Saginaw in March 1873. East Saginaw was incorporated as a village in 1855 and as a city in 1859. Saginaw City was incorporated as a city in 1857. The two municipalities, East Saginaw and Saginaw City, long traditional rivals, were consolidated by act of the legislature of 1889 into the city of Saginaw, and the first meeting of the common council of the consolidated city was held March 12, 1890. The population of the city is cosmopolitan in character. For many years the Germans predominated, as attested by their many societies of an educational and social character. Later comers were the Irish, French, Poles and Bohemians. Negroes and Mexicans were imported later, the latter to work in the beet fields. The Mexican group has dwindled due to labor competition from the Negroes and also to deportations. A new city charter was adopted by the city in 1936. It is of the city-manager-council form of government and has attracted wide attention from students of city government. In 1950 the city had a population of 92,918.

SAGINAW, a river in Michigan which is formed by the junction of the Flint and Shiawassee, and flows nearly due north into Saginaw Bay. The main stream is only about 20 miles long, but with its branches it drains a large portion of the lower peninsula. It is navigable to the city of Saginaw, 16 miles.

SAGINAW BAY, the largest inlet of Lake Huron on the coast of the United States. It indents the east coast of the lower peninsula of Michigan. It is about 60 miles long and from 20 to 30 miles wide. It is a safe harbor and never dangerously rough, although it is sometimes subject to storms. The color of the water in the bay is brownish-green.

SAGITTARIA, săj-ĭ-tā′rĭ-ą, a genus of plants of the water plantain family (*Alismaceae*). It is a widely distributed genus, wholly or partly aquatic, native to the temperate zones and the tropics. The species are handsome, with lancelike, elliptical or arrow-shaped leaves, erect or floating; the flowers are verticillate in threes around the upper part of the scapes that carry them well above the water, and are three-parted, with beautiful white and crinkled fungacious petals. The common arrowhead (*S. latifolia*) grows in the mud along rivers and ditches, and is very ornamental with its charming whorls of flowers rising from the center of a cluster of large, erect, sagittate leaves, varying surprisingly in different plants in respect to size and shape. It is a perennial, with thick fibrous rootstocks, which produce oval, fleshy tubers, often as large as a hen's egg, abounding in starch, and a staple and nutritious article of food with many Indian tribes. The squaws sometimes waded into the mud where the arrowheads grew thickly, loosened the tubers with their toes and when the plants floated to the surface captured them and flung them into canoes, to be boiled or roasted. *S. chinensis* is cultivated in China for food.

SAGITTARIUS, săj-ĭ-tā′rĭ-ŭs, *in astronomy,* a southern constellation south of Aquila and partly in the Milky Way consisting of eight visible stars. It is represented on celestial globes and charts by the figure of a centaur shooting an arrow from his bow. *In astrology,* the ninth sign of the zodiac.

SAGMULLER, Johannes Baptist, German ecclesiastical historian: b. Winterreute, Württemberg, Feb. 24, 1860. He was educated at the Latin School of Mergentheim, the Ehingen High School and the Seminary of Tübingen. He was ordained to the Roman Catholic priesthood in 1884; was curate at Alpirsbach in 1884–1887, and tutor at Tübingen Seminary in 1887–1893. He was special professor of history in 1893–1896 and after 1896 was professor of canon law and pedagogics at the University of Tübingen. His published works include *Die Papstwahlen und die Staaten von 1447–1555* (1890);

Die Papstwahlbullen und das staatliche Recht der Exklusive (1892); *Zur Geschichte des Kardinalats* (1893); *Die Tätigkeit und Stellung der Kardinäle bis Papst Bonifaz VIII* (1896); *Die Entwicklung des Archipresbyterats und Dekanats bis zum Ende des Karolingerreichs* (1898); *Lehrbuch des katholischen Kirchenrechts* (1904; 2d ed., 1909); *Die kirchliche Aufklärung am Hofe des Herzogs Karl Eugen von Württemberg* (1906); *Die Trennung von Kirche und Staat* (1907); *Wissenschaft und Glaube in der kirchlichen Aufklärung* (1910); *Unwissenschaftlichkeit und Unglaube in der kirchlichen Aufklärung* (1910); *Der Rechtsanspruch der katholischen Kirche in Deutschland auf finanzielle Leistungen Seitens des Staates* (1913). He also contributed to periodicals and encyclopedias.

SAGO, a farinaceous food, obtained from the central portion of various species of tropical palms, principally, however, from *Metroxylon rumphii* and *M. laeve.* The sago palms flourish in wet soil, and are cultivated in the East Indies, and particularly in Sarawak. They are rarely over 30 feet high and have stout stems, with an outer rind about two inches thick, as hard as bamboo, but filled with spongy pith, containing a large proportion of starch.

The preparation of sago is one of the industries of the East Indies. The trees flower only once, and if allowed to do so, and to fruit, would exhaust the mass of starch stored in their stems, and then die, after propagating themselves either by seeds or by offshoots. To prevent this, the trees are felled when they are about 15 years old and on the point of flowering. The starchy tissue, then most productive, is extracted and pounded or grated to a powder. This is kneaded in water, in a cloth or sieve, the escaping water carrying the starch into a trough, where it is washed and settled out, until fit for use. The water is then drawn off and the caked residue is ready for native cookery. This cake, or meal, when made into a paste and pressed through a sieve, forms fine pearly grains, which are left either in their original brownish hue, or are bleached, and compose the commercial product, pearl sago.

Sago-meal is eaten by the natives as pottage, or as biscuits, partially baked in earthen molds. It is not entirely soluble in hot water, as is ordinary starch, and can, therefore, be employed in making puddings, etc., forming a valuable article of food, as it is cheap, nutritious and easy of digestion. In Europe it is used for feeding stock, making starch and by cocoa manufacturers for their beverages. Inferior qualities of sago are produced by *Phoenix farinifera, Corypha* of various species, *Caryota urens, Raphia flabelliformis,* and two South American palms.

Portland sago is a delicate farina extracted from the corm of the European wake-robin (*Arum maculatum*). Wild sago is the product of the coontie-root. (*Zamia integrifolia*), a cycadaceous plant of Florida, well known as an article of food among the Seminoles; and other cycads, incorrectly called sago palms, furnish a coarse kind of sago.

SAGOIN, sa-goin', or **SAGOUIN,** a French form of the native South American name of a genus (*Callithrix*) of Brazilian monkeys, of small size and remarkably light, active and graceful in their movements.

SAGOYEWATHA. See Red Jacket.

SAGUA LA GRANDE, sä'gwä lä grän'dā, Cuba, town in the Province of Santa Clara, on the Sagua la Grande River, 150 miles east of Havana. It is connected by railroad with La Isabela, its port on the north coast, with Cienfuegos, Havana and Matanzas, and with towns to the east; and carries on a considerable trade, sugar and molasses being the chief exports. Formerly gold was mined in the vicinity to some extent. It is well built, with wide and regular streets; among its public buildings are a hospital, a town hall and a large church; it has also several schools. Pop. (1931) 19,035.

SAGUENAY (săg-ĕ-nā) **RIVER,** Canada, large river in the Province of Quebec, emptying into the Saint Lawrence at Tadousac Harbor. It is about 120 miles long and of remarkable depth—17 to 500 fathoms. It drains Lake Saint John and flows with almost unparalleled impetuosity, between high rocky walls and over deep precipices, forming numerous falls and cataracts in its upper course. Its magnificent scenery attracts many tourists. It is navigable for large vessels as far as Ha Ha Bay, 10 miles south of Chicoutimi.

SAGUNTUM, sa-gun'tŭm, now **SAGUNTO,** or **MURVIEDRO,** Spain (*Hispania Tarraconensis*), situated near the mouth of the Palantias, three miles from the coast and 18 miles by rail from Valencia. It was a rich commercial town in early times, especially famous for its figs and manufacture of a certain kind of pottery. The town was founded (date unknown) by Greek colonists from Zacynthus, whence its name. In the interval between the First and Second Punic wars, it formed an alliance with the Romans, and became celebrated for the resistance it made to Hannibal in the siege of 219–218 B.C. The city was nearly destroyed at this time, but the Romans rebuilt it and made it a colony. The ancient city is now replaced by the modern Murviedro, and the only important ruins are those of the theater. Pop. (1930) 20,235.

SAHAPTIAN. See Shahaptian Indians.

SAHARA, sa-hä'ra, Africa, the great desert region in the north of the continent, extending from the Atlantic eastward as far as the Nile, and from the Mediterranean provinces to the Niger and Lake Tchad. Its area is about 1,500,000 square miles,—equal to four fifths of Europe. The configuration is irregular and the surface highly diversified, reaching from 100 feet below the sea level to an altitude of from 5,000 to 8,800 feet in Mount Tousside. Some of the highest summits are those of the Ahaggar, a great mountain plateau. Aïr or Asben is an isolated mountain, midway between Tibesti and the Niger. Farther south is the extensive plateau of Adghagh. At the northeast in Fezzan are the dark mountains of Jebel es Sóda. The rest of the Sahara consists generally of undulating rocky surfaces and sand dunes interspersed with occasional oases. The date palm flourishes on these green spots, also the olive tree. Apples, peaches, oranges, grapes, etc., grow, and wheat, barley, rice, durra and other tropical crops are raised, and there is a considerable variety of flora. Mammals consist, outside of the domestic animals, such as camels, asses, black cattle, of 15 species, compris-

ing the jerboa, fox, jackal, baboon, hyenas, mountain sheep, etc.; about 80 species of birds, among which is the ostrich. There are also tortoises, lizards, chameleons, serpents, such as the python, horned viper, etc. The edible frog and fish also occur. There is an important trade in silk tissues and mixed goods, ivory, ostrich feathers, gums, spices, musk, hides, gold dust, indigo, cotton, palm oil, kola nuts, silver, dates, salt and alum. The imports are textiles, weapons, gunpowder, etc. Many thousand tons of phosphate are extracted. The range of temperature is very great. The chief centers of population are the oases. The inhabitants consist of Moors, Tuareg, Tibbu, Negroes, Arabs and Jews; the former occupy the region between Fezzan and Lake Tchad. The tribes of the desert inhabit the south of Algeria and Tunis. The Tuareg control the principal caravan routes. The Tibbu, who number about 200,000, live in the oases between Fezzan and Lake Tchad. By convention with Great Britain, the right of France to all the Sahara except the Libyan Desert is recognized, or about three fifths of the whole, outside Tripoli and a small portion owned by Spain. The Sahara is included in the province of French Sudan. The French government and private individuals have experimented with traffic by specially designed motor cars, with success, and regular routes are maintained to Timbuktu and other cities. The French Sahara has an area of about 1,500,000 square miles, and a population of about 2,000,000.

SAHARANPUR, sa-här-an-poor′, or **SEHARUNPOOR,** sĕ-här-ŭn-poor, India, (1) capital of a district of the same name, in the United Provinces of Agra and Oudh, 90 miles northeast of Delhi. It is an important railway junction. Among the buildings the most noteworthy are an old Rohilla fort (used as a courthouse), and a fine Mohammedan mosque. The residential part is substantial and modern. There is a church, an American Presbyterian mission and a fine botanical garden for experiments in tea and cinchona. Commerce in grain, sugar, molasses, and country cloth is considerable. Pop. about 70,000.

(2) The district in the Meerut division has an area of about 2,242 square miles, and occupies an alluvial tableland between the Ganges and the Jumna. It consists partly of wildly picturesque broken ground, but the larger portion is tillable. Cereals are the chief products, and its commercial importance is considerable. Pop. about 1,200,000.

SAHIB, sä′ĭb, the term of native address in India to a reputable European. It is an Arabic word, signifying companion or lord. The feminine form is *Sahibâ.*

SAI, sä′ĭ, a Brazilian native name for a local monkey of indefinite application, most often, perhaps, designating the capuchin (*Cebus capucinus*).

SAID PASHA, sä-ēd păsh′â, Turkish statesman: b. 1835; d. Constantinople, Oct. 29, 1907. He commanded an army corps in the Russo-Turkish War, became governor of Cyprus and was later appointed secretary of state. He was premier 1879–1882, was grand vizier 1882–1885 and was twice dismissed but reinstated by the sultan in 1883. In 1885–1895 he was minister of foreign affairs, and subsequently president of the Council of Ministers.

SAIGA, sī′gą, an antelope (*Saiga tartarica*) found on the steppes of Russia and in western Asia. It is about two and one half feet high at the shoulders, pale bluish-gray in color and is remarkable for the greatly swollen appearance of the nose, due to the thick cartilaginous coverings of the nostrils.

SAIGO, Kichinosuke Takamori, Japanese patriot: b. Kagoshima, 1827; d. there, Sept. 24, 1877. He was of the samurai class and an enthusiastic partisan of the Mikado. In 1858 the vigor with which he urged the overthrow of the Tokugawa administration caused his banishment to Satsuma. He took an important part in the restoration of the Mikado in 1868. He was appointed commander-in-chief of the army by the Mikado and retained the office until 1873 when, his desire to attack Korea being overruled, he retired to Kagoshima. The samurai class, which was largely disaffected because of opposition to the progressiveness of the emperor, rallied to his support and in 1877 launched a rebellion against the government. He fell in action at Kagoshima. The government, mindful of his invaluable services in establishing the Mikado on the throne, erected a bronze statue of him at Tokyo.

SAIGON, sī-gōn′ (Fr. sâ-ē-gôn′), French Indochina, capital of the colony of Cochinchina, on the right bank of the Saigon or Donnai River, 34 miles from the sea. Before the French conquest, Saigon (then known as Gaidinh-thanh) was the capital of Lower Cochinchina. It was captured by the French in 1859 and was included in the territory ceded to France in 1862. The city adjoins the municipality of Cholon to the southwest, with which it is united by railway, tramways, roads and canal, and the two comprise a new administrative division, the Region Saigon-Cholon. Saigon had, in 1936, a population of 110,577, of whom 9,821 were French and 274 other Europeans. The population of Cholon in the same year was 145,-254, almost entirely Asiatic.

Saigon has fine public buildings, modern shaded streets, and zoological and botanical gardens; its educational institutions include the colleges of Chasseloup-Laubat and d'Adran. There are seven banks or bank-agencies in the city, the two chief ones being the Franco-Chinese Bank and the Indochina Bank. Saigon handles half the seaborne foreign trade of the country, chief exports being rice, rubber, maize, teakwood, tin, tea, pepper, and hides. An active trade is carried on with China, Siam, Singapore, and Java. Considerable French and English goods are imported, among them textiles, petroleum products, raw cotton, iron and steel, machinery, and paper. During 1938, the well-equipped port was visited by 777 ships totaling 2,494,000 tons. The chief industries of Saigon and Cholon are rice and sawmilling, electric power, alcoholic beverages, textiles, soap, and chemicals. Saigon is the seat of two Chambers of the Court of Appeal of French Indochina, of tribunals of first instance and of commerce, and of the vicar apostolic of Cochinchina. See also FRENCH INDOCHINA.

SAIL, or **SAIL-TAILED, LIZARD,** a large agamoid lizard (*Lophurus amboinensis*) of the Philippines, Celebes, Java and neighboring islands, which takes its name from the tall sail-like crest bone upon the upper surface of

the tail of the adult, which is supported by a great lengthening of the spines of the vertebræ of that region; the tail otherwise is highly compressed, long and powerful. The lizard frequently exceeds three feet in length, is olive-green, spotted and marbled with black, and has many curious folds of skin about the neck. It is strong and active and spends much of its time in trees, but when alarmed or chased rushes for water, dives to the bottom and endeavors to hide among the stones. It is defenseless and harmless, and its flesh, which is white and tender, is much liked by the islanders.

SAIL. See SHIP.

SAILCLOTH, a coarse, strong linen, cotton or hempen cloth used in making sails. The best is made of flax, and combines flexibility with lightness and strength. See SHIP.

SAILFISH, a large predaceous fish (*Istiophorus nigricans*) of the West Indian and neighboring waters, which is closely allied to the sword-fishes and of the same family as the spear-fishes (*Tetrapturus*). It reaches a length of six feet, has an elongated, much compressed body, covered with elongate scutes, and a powerful, deeply forked tail, while the dorsal fin is, relatively, of huge size and deeply notched outline, well simulating the appearance of a ship under sail as it appears above the water when the fish glides along the surface as it frequently does. The bones of the nose are prolonged into a "sword," not so long as that of the sword-fish, but sharper, and they are an effective weapon in a school of small fish.

SAILING. See NAVIGATION; SHIP; SAILING VESSELS.

SAILING VESSELS. The first vessel of which history gives any description is the *Ark,* as built by Noah. Its proportions possess some interest, because, though not intended for a voyage, it may be inferred that it was constructed to float with as little motion as possible, considering that it "went upon the face of the waters" for about five months. Assuming a cubit to be about 21 inches, its length was 525 feet, its breadth 87 feet 6 inches and its depth 52 feet 6 inches. Its length is thus seen to have been six times its breadth, which proportion is about an average of all types of vessels. Its draft of water must have varied greatly during the period of its occupation, as 12 months' provisions must have formed a very large proportion of the original weight, and these must have been gradually consumed. It had three decks; but was fitted with neither masts, sails nor rudder.

Ancient History.— The paintings and sculptures, as the early records of Egypt, show regularly formed boats constructed of sawed planks of timber, propelled by numerous rowers, and also by sails. These vessels were long galleys with one mast and a large square sail, which was sometimes of linen and sometimes of papyrus. The oldest authentic record as to these sailing vessels is the illustration of one of them used as a decoration on an Egyptian amphora (in the British Museum), judged by the best authorities to have been made about 6000 B.C. It is to be noted, however, that these boats could sail only with the wind, and that the science of tacking and sailing against the wind was unknown for, literally, thousands of years, during which vessels sailed if the wind was favorable, and unshipped the mast, and set the oarsmen at work when it was contrary. The Hebrews in the time of Solomon must have possessed vessels of considerable size, as mention is made in the sacred writings of that date of stately ships, and of voyages made to bring trees of considerable size to be used in the building of the temple. The Phœnicians about 1200 B.C. had sailing vessels which did not differ in any important respect from those of the Egyptians, but they seem to have developed the art of sailing to a considerable degree. Later they were connected with the Hebrews in their maritime expeditions, and this people appear to have been the most enterprising in navigation of all the nations of antiquity. Herodotus tells us of their feat of circumnavigating the continent of Africa in 604 B.C. They started from the Red Sea, passing Ophir on east coast of Africa, then rounded the Cape, and keeping by the west shore they entered the Mediterranean Sea through the Straits of Gibraltar, and arrived in Egypt in the third year of their expedition. Little doubt exists of the Phœnicians having been the discoverers of the art of sailing, as their skill in evading Nebuchadnezzar at the siege of Tyre for 13 years shows that they possessed more than a superficial knowledge of navigation. They were also engaged in concert with other nations in wars with the Greeks: and it was from them the latter nation learned in their conflicts what they knew of ships and navigation. The fact of the Grecian mariners making use of the screw pump to discharge water from their vessels' holds would lead to the conclusion that their vessels were no mere sloops; yet the relative placidity of the waters in which they sailed suggests that their vessels were sailing boats rather than sailing ships. An evidence of the want of strength in the construction of these ancient vessels is the fact of their being bound around the outside with heavy ropes. They were sometimes carried as part of the vessel's outfit, and used as necessity required. Out at sea and in heavy weather, they were made use of. There were sometimes as many as 8 or 10 bands running fore and aft of the vessel. The Greek warships were strengthened to withstand the shock of ramming by the addition of longitudinal timbers secured to the exterior of the hull. At this period it was the custom of mariners to draw their fragile vessels out upon the shores at the approach of autumnal storms, and to leave them there till mild weather came again in the spring.

Roman Galleys.— The Romans in the early stage of their history paid little attention to navigation, until it was forced upon them by the necessity of competing with their rivals, the Carthaginians. The galleys of this period ranged from a single bank up to five banks of oars. The oars in these large galleys were arranged in sets or banks; the number of these could be increased to any extent by giving increased length to the galley. The trireme, or three-bank galley, appears to have been generally open, in the waist where the rowers sat, with decks or platforms at both ends for the soldiers. The galleys of greater size than the three tiers appear to have been always decked

vessels. At the time of the First Punic War the Roman fleet is said to have consisted of 330 vessels, each containing 300 rowers and 120 soldiers. The triremes were each 105 feet long and 11 feet wide, and the quadriremes were 125 feet by 13 feet.

Viking Ships.— Of much sturdier build were the ships of the Norsemen, designed to sail the turbulent waters of the northern seas. The custom of burying noted Vikings in the boats which they commanded has preserved under great burial mounds a number of specimens of these early ships. One of these, found in England, was 48 feet long, 9 feet 9 inches beam and 4 feet depth of hold. Another, unearthed in Norway, was 45 feet 6 inches in length, about 14 feet beam and 4 feet deep. The famous Gogstad ship, exhumed in 1880, was 79 feet 4 inches long, 16 feet 6 inches beam, 6 feet deep amidships and 8 feet 6 inches deep at bow and stern. All of these vessels were of oak, clinker-built and caulked with moss or hair of some animal. They have been decided by antiquaries to belong to the 3d century. The remains of a much larger vessel, prodigious for its time, were found in the Orkneys. It was 130 feet in length and had a depth of hold of about 15 feet. This vessel is regarded as belonging to the latter part of the 9th century, and is believed to have been one of the ships with which the Vikings conducted raids on the coast of England. These raids served to stir Alfred the Great (848–890) with a spirit of rivalry and he proceeded to build ships twice as large as those of the enemy, but of the same type. It is noteworthy, however, that he failed to find seamen of experience in his own kingdom, but was compelled to hire them in Holland. Under Athelston, the grandson of Alfred (895–941), it is known that a considerable merchant trade was carried on with France and Flanders by English sailing ships; and it is recorded in history that King Edgar (944–975) had a fleet of some 4,000 sailing ships stationed as a guard around the entire coast of Great Britain.

The expedition of Richard Cœur de Lion (1157–99) to the Holy Land led to the remodeling in some respects of the English sailing craft, through the adoption of some of the developments in construction of the ships of the Mediterranean, which were much larger as to hull, and carried taller masts and a larger area of sail. But these improvements in the English ships were chiefly those for warlike purposes and the more important features of the Mediterranean vessels seem to have been overlooked, or at least neglected, for they did not appear in the English ships until the 15th century.

Merchant Ships.— It is generally supposed that ships intended only for merchant purposes were first built by the Genoese, and that not until the beginning of the 14th century were sails first used by that people. The fishing boats were the small beginning from which sprang the sailers and the larger sail vessels of a later period. But it is an indisputable fact that long before this time ships of three decks and of 600 or 700 tons, of Italian build, were sailing the Mediterranean with both freight and passengers. In England, as early as 1344, many vessels of this character were in service. In the middle of the 15th century many large vessels were built in England, but they were mostly naval vessels. Prior to this the compass had come into more general use, and it was now possible to engage in longer voyages. The discovery of America and the passage around the Cape of Good Hope were early fruits of these improvements. The Portuguese employed vessels of small size in their voyages of discovery, but the Spaniards built larger vessels and long maintained a superiority in this respect. England was far behind the Peninsular nations in commercial enterprise at the opening of the 16th century, but under the reign of Queen Elizabeth (1558–1603) the merchant marine of England was relieved of many oppressive laws and the coasting trade of the British Isles was reserved exclusively for British ships. And not only did the coasting trade flourish, but English shipping began to contest successfully with that of Italy, Spain and Portugal for the carrying trade of the world. Moreover, a distinct change appeared in the design of English ships in the abandonment of the high Spanish poop and forecastle prevalent on the vessels which sailed the Mediterranean. Meanwhile the French had not been idle, and while their merchant ships were few and small, they were building war vessels which compared well with those of Spain and England, though leaning in type toward the Spanish models. The *Cordeliere* of 700 tons and the *Grand Louise* of 790 tons were as large as any ships afloat.

The Spanish Armada, which visited English waters in 1588, comprised 130 sailing vessels of all sorts, with a total tonnage of 60,000. Some 60 of these were galleons of the largest type. The wrecking of one of them on the western coast showed it to be of 900 tons. At this time the «treasure-ships» of Spain, 100 feet in length and 34 feet in breadth, were making regular voyages across the Atlantic for the gold and silver of the New World. More light on the shipping of those days is afforded by the record of the carak *Madre de Dios,* captured by the English in 1592. This vessel was 165 feet in length, 46 feet 10 inches beam and drew 26 feet of water. The height of her mainmast was 121 feet and her main yard was 106 feet long. Her capacity was 1,600 tons, by far the largest known up to that time.

The Dutch ships of this period were distinctive in model owing to the shallow waters in which they sailed. They were low and of comparatively wide beam and large sail area. For their smaller craft the Dutch had already developed the fore and aft rig, and were using both the sprit sail and sprit topsail on their galleons. It is to be noted in passing that the Dutch galleons were at this time determinedly engaged in the first polar explorations on record — the endeavor to find a northeast passage to China (1594, 1595 and 1596). From the earliest times the Dutch had been fishermen and accomplished navigators, and while their war fleet was small, their merchant fleet grew apace and by the early part of the 17th century they controlled the coasting trade as far south as Portugal and were successfully monopolizing the East India trade of Britain. The English merchant marine was in a very depressed condition. Internal discords had put a damper on the enterprise of the merchants, and as the island was not yet famed for its manufactures,

commerce dropped with every disaster to trade. The British East Indies Company was formed under the auspices of Queen Elizabeth (1599) and some great ships were built for this trade, the largest being the *Trade's Increase* of 1,200 tons. From this time onward the British made every effort to control the shipping trade of the world. The Dutch were their principal competitors, and had, without doubt, the best-built and best-manned fleet and had established colonies in South America, to which their ships made regular voyages. The British policy was to build larger ships than those of any other nation and in this they surpassed the Dutch, but the French excelled them. The *Sovereign of the Seas,* built in 1637, was the largest of the British ships at this period. She was 170 feet long, 48 feet beam and 19 feet deep and measured 1,683 tons. The largest Dutch ships at that time were the *White Elephant* of 1,482 tons and the *Golden Lion* of 1,477 tons. The French had the *Soleil Royal* of 1,946 tons and the *Royal Louis* of 1,800 tons. The English continued to build larger vessels and in the early 18th century had the *Royal George* of 2,047 tons, and in 1765 launched the *Victory,* Nelson's famous flagship of 2,162 tons. The capture by the British in 1792 of the French *Commerce de Marseilles* of 2,747 tons aroused new emulation of the French shipbuilders, and the direct result of this impetus was the *Caledonia,* launched in 1808, a vessel 205 feet in length and of 2,616 tons.

The First American Ships.— This continent having been fitted by nature in supplying it with an abundance of good timber, vessels have been built upon our shores from the first year of actual settlement. The first ship constructed was for the purpose of carrying a small band of settlers back to England, who were discouraged with their prospects after the first winter. The vessel was built in 1607 at Stage Island, near the mouth of the Kennebec River in Maine. It was a staunch and excellent little vessel of 30 tons, a two-master, named *Virginia.* She is believed to have been about 30 feet long, 13 feet beam and 8 feet deep. She subsequently made a number of voyages between America and England. The next vessel built was at New York in 1614 by Capt. Adrien Blok, who had lost his ship *Tiger* by fire while lying in Manhattan River. His new vessel was named *Onrust* (*Restless*) and was 38 feet keel, 44½ feet long over all and 11 feet beam. This vessel was employed for several years in exploring the Atlantic Coast from the 38th to the 42d degree of latitude. Block Island was visited during one of the excursions and took its name from Adrien Blok. With the exception of fishing boats and shallops, there is no record of the construction of any other boats until 1631. In that year the 30-ton bark *Blessing of the Bay* was launched at Medford, Mass., for the use of the Massachusetts colony. In the course of the season this vessel made several coasting trips and soon after visited Manhattan Island and Long Island. It is thought the vessel was lost with a load of furs and fish in 1633 off the capes of Virginia. By 1635 there were six of these small sailing vessels regularly employed in the trade with England. In 1636 the *Desire* of 120 tons was built at Marblehead and put into the fishing business.

Early Shipbuilding.— Shipbuilding at this time appears to have received its impulse from the same cause which threw the colonists upon their own resources for the supply of many of the necessaries of life. They had been hitherto supplied with all but their corn and fish by the many emigrant ships which had yearly added to their numbers. A suspension of this emigration, brought about by the civil wars in England, and the diminished intercourse caused thereby, left them dependent on mercantile enterprise alone, which the state of navigation then rendered precarious in the extreme. Governor Winthrop then said, "The general fear, of the want of foreign commodities, now our money was gone, and things were like to go well in England, set us on work to provide shipping of our own: for which end Mr. (Hugh) Peter, being a man of very public spirit and singular activity for all occasions, procured some to join for building a ship at Salem of 300 tons, and the inhabitants of Boston, stirred by his example, set upon the building of another at Boston of 150 tons. The work was hard to accomplish for want of money, etc., but our shipwrights were content to take such pay as the country could make." He speaks in another place of the *Trial* of 160 tons, as the first ship built at Boston. She sailed for Bilboa on 4 June 1642, laden with fish, "which she sold there at good rate, and from thence freighted to Malaga." Thus early began the profitable trade to distant ports from New England, and by 1676 the colony of Massachusetts owned 200 vessels of from 30 tons to 50 tons; 200 of from 50 tons to 100 tons, and 30 above 100 tons. An early and successful prosecution of the business of shipbuilding could have been more reasonably expected of none of the first colonists of America than of the settlers of Manhattan. Holland was at that period, and long after, in the enjoyment of the carrying trade of the world. Though not possessed of a foot of timber, she built and armed more ships than all the rest of Europe. Planted by this commercial people, and by merchants and capitalists of Amsterdam, then the mercantile metropolis of Europe, exclusively for the purposes of trade, it appears somewhat surprising that the facilities afforded by the new territory for shipbuilding were not made available to a greater extent by the parent nation. But the administration of a privileged mercantile association, such as the West India Company, which, in 1621, was invested with a monopoly of its trade, was unfavorable to the development of the resources of the colony. About 1630 the carrying trade between Holland and America, and the trade with Brazil, where the company had sustained losses equivalent to "one hundred tons of gold," were thrown open to the colonists and private ships were for the first time entered at Amsterdam and publicly advertised for New Netherlands. Other restrictions, which had fettered commerce, were soon after removed and the trade of the world with the exception of that to the East Indies, and the trade in furs, were open to the colonists. In 1678 the shipping owned in the port consisted of three ships and 15 sloops and other small sailing vessels. In 1694 the shipping had increased to 60 ships and 102 sloops. This was on account of a monopoly of exporting flour and biscuits from the

province. South of New York during colonial times there was little or no construction of vessels. New England developed her large shipping interests through the fisheries that were at her door and the coasting trade maintained by the latter extended as far south as the West Indies during these early days. It might be said the fisheries were the cause of the large merchant marine of New England. Between the years 1674 and 1714 a total of 1,332 vessels were registered as built in New England yards, in many cases by men drawn from English shipyards. Of those built, 239 were sold to foreign owners.

The Schooner.— In 1745 Andrew Robinson of Gloucester, Mass., built a vessel with a square stern, which was fitted with two masts, bearing a sloop sail on each, and a bowsprit with jib. She was sharp on the bottom and on being launched sped over the water so fast from the impetus gained by descending from the ways as to elicit from a bystander the remark, "See how she scoons." Scoon was a word used by plain people to express the skipping of a flat stone over the surface of the water when skilfully thrown; and the builder of the vessel, having been somewhat at a loss for a name for the new rig, seized upon the trifling incident and replied, "A scooner let her be," and two-masted vessels, with jibs, and fore and aft sails have since been called by that name. This vessel was probably used in the fisheries. The schooner proved to be a very economical vessel to run, with fewer men to her sail area than any other type of sailing vessel. The largest schooners were those sent to the Grand Banks, and for many years after 1800 about 70 sailing vessels were sent annually to the Grand Banks, chiefly from Cape Ann. These early vessels were from 20 to 40 tons.

Colonial Merchant Marine.— Before the Revolutionary War our merchant marine was in a prosperous condition and took nearly first rank with us. By 1760 from 300 to 400 trading vessels were being built annually in the different provinces. In 1769 alone, 389 ships with a tonnage exceeding in the aggregate 20,000 tons were turned out of American shipyards. Of these, 113 were square-rigged and a large proportion of the remainder were schooners. Few of these exceeded 200 tons. During the War of the Revolution the whaling and fishing fleets suffered seriously from raids by English cruisers. Foreign trade in our vessels suffered the same fate. A large part of the merchant and fishing fleet was employed during the war in privateering and it became a profitable field for them at times, as small armed sloops frequently captured large merchantmen under the British flag. The larger privateers built during the war, when the conflict was over, were converted into merchantmen and sent to the East Indies to trade. The Baltimore-built schooner took high rank as a privateer during the war. The 16 years that followed ending with the War of 1812 were perilous times for American shipping. England excluded us from a profitable trade with the British West Indies and the same interests led to the searching of our merchant vessels for British subjects, the capture and confiscation of our vessels and cargoes and a detention of a large number of them for evasions of the British law. The American merchant fleet which had increased to a total registry of 848,307 tons in 1807 fell to 769,054 tons in 1808, under the restrictions of the American embargo laid at the insistence of Great Britain. The repeal of the embargo in 1809 brought the tonnage of the merchant fleet to 910,059 and in 1810 it reached its high-water mark for many decades to come at 984,269 tons. Then came on the War of 1812 that lasted for nearly three years, during which many privateers were constructed that subsequently pursued the peaceful pursuit of trade. A change in the form of our sailing vessels now began to appear, giving them better entrance lines, and cutting off those high poop decks that had been such a fixture on large vessels for many years.

The Carrying Trade.— Prior to the War of 1812 our coastwise trade was carried on by no larger sailing vessels than those that were schooner rigged, while our foreign trade was most largely carried on in foreign-built bottoms. Before 1812 a few sailing packets, or vessels carrying both passengers and freight, were brought into the transportation business, and cleared from port on regular days in each month, and were operated between special points only. At this time, however, there were many American-built whalers making three-year voyages to the Pacific from Massachusetts harbors and not a few had gone as far as Bering's Sea. The average tonnage of these daring vessels was less than 300 tons. When the war ended there were only a few small British ships in the packet service between England and America, and very few between America and other parts of the world. Soon after the peace, however, a large number of lines came into existence as a natural outgrowth of the rush of emigration from Europe to America, and the general expansion of ocean travel and trade. The carrying of passengers was a profitable business and there was considerable competition among shipping merchants to get the most business for their vessels. None but the best and finest vessels could be used in this trade and the old-fashioned freighting vessels with their small cabins and houses and poop decks, were subjected to many changes to adapt them to the passenger business. The merchants at most all our coastwise ports, from Portland, Me., to New Orleans, La., soon saw the advantage of these packets for our coastwise trade and regular established lines were soon in operation that remained as carriers until the coastwise steamship lines began operations in 1847, when these lines of sailing vessels gradually withdrew from business. In this trade brigs, schooners and barks were used, while in the foreign service ships and barks only were placed in service.

Packet Lines.— It was at New York the packet business between Europe and America mainly centred. There were lines from other ports, but New York was the pioneer, always kept the lead and had the largest number and finest vessels for the service. In 1816 Isaac Wright and Company of New York founded the famous Black Ball Line, so called from the round black circle in a white field, which was adopted as the pennant of the ships. There were at first four vessels in this line, each of 400 tons, and named *Pacific*, *Courier*, *Amity* and *James Monroe*. This line was subsequently owned by Goodhue and Company, Charles H.

Marshall and others, and a dozen other ships added, from 300 to 500 tons burden. They were placed in the Liverpool trade and sailed once a month at first and during the first nine years the average time in voyages to Liverpool was 23 days and for returning home 40 days, but one of the later ships, the *Canada*, the fastest of them all, once made the outward voyage in 15 days and 18 hours and held for a long time the average record of 19 days outward and 36 days homeward trips. A London line followed the Black Ball line and then a Havre line was started. In 1821 a second Liverpool line was established from New York by Byrnes, Trimble and Company, known as the Red Star line, consisting of the *Manhattan, Hercules, Panther* and *Meteor*, sailing once a month, and soon after Fish, Grinnell and Company, afterward Grinnell, Minturn and Company, founded the Swallow Tail line with four packets, making from New York at this time, one sailing for Liverpool each week. In 1830 the passenger fare in the cabin from Liverpool was $180, including beds, bedding, wines and stores of every description. The London packets now sailed twice a month and the Havre line had three sailings a month. There were also at this time sailing packets to South America and Mexican ports. In 1830 there were 1,510 arrivals at New York from foreign ports, of which 382 were ships, 28 barks, 714 brigs, 376 schooners, 8 sloops, 1 ketch and 1 felucca. Of these, 1,366 were American, 92 British, 7 Spanish, 12 Swedish, 2 Hamburg, 5 French, 8 Bremen, 6 Haitian, 9 Danish, 2 Brazilian, 2 Dutch and 1 Portuguese. The number of arrivals in 1829 was 1,310, and passengers, 16,064. In 1823 John Griswold established a London line of four vessels, that had been increased by 1837 to 12 vessels. These vessels down to 1845 were one- or two-decked vessels, and had increased in size from 900 to 1,000 tons. The between deck space, aft, was divided into cabins for the passengers, the middle portion was fitted up with kitchens, pantries, etc. The steerage passengers and crew were placed forward. After 1830 there were frequent sailings of rival packets, transient, but all American, from Boston, New York, and Philadelphia to Great Britain and other parts of Europe. All the ships sailed with great speed and made the run across the Atlantic in excellent time. The *Red Jacket* once ran from New York to Liverpool in 13 days 11½ hours. The *Mary Whiteridge* made the voyage from Baltimore in 13 days 7 hours; but the usual time was 19, 20 or 21 days to Liverpool and from 30 to 35 days homeward. English steamers were sent out in 1838 and 1840 to compete with these packet lines; but the steamers did not at first make much better average time on a voyage than the packets, but in the course of a few years the increase in speed and their additional carrying capacity gave them an advantage and the packets could no longer successfully compete with them.

Clipper Ships.—After the packets came the clipper ships, vessels intended primarily for freighting, and built to secure the highest possible speed when laden with cargo. The packets were the fast sailers from 1816 to 1845, but after the latter date there grew up various branches of trade in which a quick delivery was as important for commercial purposes as it was for the passenger trade. For instance, there was the tea trade from China to the United States, in which speed has always been considered essential. The cargoes consisted of teas, spices, coffee, dried fruits, etc., which were liable to deteriorate in a long voyage of four months to the home port, and to shorten the voyage as much as possible was desirable for many reasons. There were no telegraph lines and ocean cables in those days and the uncertainty of the markets made fast trips home from the East Indies very important. Merchants had repeatedly suffered heavy loss, sometimes business ruin by the decline in eastern goods brought home by ships during their absence on the voyage out and back, and good ships were, therefore, always required in that trade. The first clipper, the *Scottish Maid*, was built in 1839 in Great Britain. She was a schooner of 150 tons and proved very fast and continued in service for 50 years. The first American clippers were built at Boston and Medford. These were small schooners, the *Angola* of 90 tons and the *Zephyr* of 150 tons. They were used in the opium trade. The pioneer of the large clippers was the *Helena*, of 650 tons, whose dimensions were 135 feet length on deck, 30 feet 6 inch beam and 20 feet depth of hold, built by William H. Webb. She came out in 1841 and was constructed for A. and N. Griswold for the China trade. She was a good sea boat and a very fast sailer for her day, making many fast voyages between China and other East Indian countries and New York. Following the *Helena* came the *Rainbow* of 750 tons, built by Smith and Dimon in 1843 for Howland and Aspinwall. She was the first of the extremely sharp type and at the time was claimed by her captain to be the fastest ship in the world. Very few sailing ships since have equaled her records. This vessel made the voyage to Canton and return home in six months and 14 days, having spent three weeks of the time in loading and discharging cargo. The *Helena* and the *Rainbow* brought about a great change in this type of vessel. They commanded better prices for freights than sloop ships, and in every way proved desirable. Then in 1844 followed the *Montauk* of 540 tons for William S. Wetmore, built by William H. Webb. Then A. A. Low and Company had Brown and Bell construct for them the *Howqua* of 706 tons, a very fast and fine vessel, which made a voyage from Shanghai to New York in 84 days. The owners of the *Rainbow* then had the noted clipper *Sea Witch* of 907 tons, built by Smith and Dimon, with the intention to have the fastest vessel of the type afloat. This vessel had finer under water lines than her predecessors, and may be said to have been the first of that advanced type of fast clipper ships. She made one voyage to California in 97 days; to Hongkong in 104 days; to Valparaiso in 69 days; and returned from Canton to New York in 85 days. Her best 24 hours run was 358 miles, a speed greatly exceeding any steam vessel then existing. The era of fast clipper ships was now fairly inaugurated, and many of this class were now built not only at New York, but at Boston, Philadelphia and Baltimore. Nearly all the early ones did not exceed 1,000 tons register, or about 165 feet long, but competition led to

a great increase in size, and every year saw vessels launched that spread more and more canvas, longer, larger and faster than ever, and expressly intended to excel everthing that had preceded them in the merchant shipping of the world. In 10 years after the first clipper ship the size of 2,400 tons was reached and there were many built 2,000 tons each.

British Rivalry.—Foreign merchants were by no means idle spectators of what was going on in this country, and in 1846 England began to awake to the new and dangerous rivalry from America. The arrival of the *Oriental*, 1,003 tons, in London in 1850, 97 days from Hongkong, with 1,600 tons of tea, on which she collected $48,000 freight, created a furore. Not a single British ship was her equal in speed or elegance of line and construction. The British Admiralty sought and were given permission to draught her underwater lines in drydock; and a great impetus in the building of fast ships resulted. Alex. Hall and Company of Aberdeen made a specialty of clipper ships, and there were launched from their yard many superior and famous vessels. But the Americans, though hard pressed, were able to maintain the lead, and entitled to the best record ever made by ships sailing under canvas. There were several famous races home from China. Once the British clippers *Chrysolite* and *Stornaway* and the American clippers *Race Horse, Surprise* and *Challenge* engaged in a race from Canton to Liverpool and Deal and arrived at the home ports as follows: At Liverpool, *Chrysolite* in 106 days; at Deal, *Stornaway* in 109 days; *Challenge* in 105 days; *Surprise* in 106 days. The British ship *Challenge* ran from Shanghai to Deal in 113 days, and the American clipper *Nightingale* in 110 days. These races were claimed by both parties; but the Americans kept the reputation of superiority, and several ships were ordered at our shipyards for foreign account. Then shortly after the gold fever broke out in California, and the *John Bertram* of 1,100 tons was built at Boston, Mass., and sent to the Pacific Coast in 1850 by Boston parties. This was the first clipper ship built for the California trade. The *Witch of the Wave* and four others of 1,500 tons each were immediately after built for the same parties. The *Witch of the Wave* made the trip from Canton to Deal in 90 days — 15 days faster than the best previous record, that of the *Challenge*.

Sailing Speed.— The speed of the clippers was remarkable. Six miles an hour was a good average rate of speed for long voyages and nine miles an hour excellent time, especially for a ship loaded with a full cargo of merchandise. Clippers ran across the Atlantic to Liverpool at an average speed of nine miles an hour, spurting at the rate of from 10 to 13 miles with a favorable wind, and on voyages that gave them the advantage of the trade winds they ran for days and weeks in succession at an average speed of from 12 to 15 miles an hour. To sail 300 miles a day was not exceptional. The largest of them all was the four-master *Great Republic*, of 4,555 tons, built by Donald McKay in 1853 at East Boston. The length on load line was 314 feet, beam molded 49¼ feet, molded depth 32 feet. She was burned at her dock before sailing. The hull was afterward rebuilt at Greenpoint, L. I., and was launched at 3,357 tons, being still the largest ship afloat. One of the noted clippers of the day was the *Dreadnought* built in 1853 at Newburyport, Mass. In 1859 she made the voyage from Sandy Hook to Liverpool in 13 days, 8 hours. Fast as the *Dreadnought* was she failed to surpass the records of the *Red Jacket*, a Maine-built clipper of 2,006 tons, of 13 days, 1 hour from Sandy Hook to the Rock Light, Liverpool (1854), and of the *Andrew Jackson*, built at Mystic, Conn., of 1,679 tons, holding the record for the west-bound voyage, 15 days from Rock Light to Sandy Hook (1860).

Other record passages of those days which have never since been beaten are the following:

James Baines, 2,515 tons, launched at East Boston in 1854; 12 days, 6 hours, Boston to Liverpool. From Liverpool to Melbourne in the then record time of 63 days; and thence home to Boston in 69 days; making the circuit of the globe in the unequaled time of 132 days.

Lightning, American-built ship of 2,090 tons, Melbourne to Liverpool, 63 days (1853); Portsmouth to Calcutta, 87 days (1857).

North Wind, American built, 1,041 tons, London to Sidney, New South Wales, 67 days.

Mandarin, 776 tons, New York to Melbourne, 71 days.

Mary Whitridge, American built, 987 tons, Liverpool to Baltimore, 14 days, 9 hours (1855).

Marco Polo, American built, 1,512 tons, Liverpool to Melbourne, 61 days (1861).

Thermopylae, British built, 927 tons, London to Melbourne, 60 days (1869).

The record voyages of American sailing ships in the coastwise trade, known as the «California clippers,» were:

Flying Cloud, 1,793 tons, New York to San Francisco, 89 days (1851). The same feat was accomplished in 1854 by the same vessel and repeated in 1860 by the *Andrew Jackson*.

Northern Light, 1,021 tons, San Francisco to Boston Light, 76 days, 5 hours (1853).

Comet, 1,836 tons, San Francisco to New York, 76 days (1854).

The best day's run ever made by a sailing ship was 436 nautical miles, recorded by the *Lightning* on her maiden voyage from Boston to Liverpool in 1854. The highest speed ever recorded by a sailing ship was 21 nautical miles per hour, made by the *James Baines* on 17 June 1856.

After 1860 there was no longer any necessity for great size and speed in this type of vessel. Too many ships had been built and a reaction set in that lasted for many years. By 1857 there were from 80 to 100 large ships in the California trade and the rates of freight fell off one-half, and the ships were thrown into the general trade of the world. In the next place, steam vessels, about 1852, had been built to run on all the principal ocean routes and there was no longer any need for sailing vessels to be fitted out with large cabins and roomy passenger accommodations. This ended the career of those fast clipper ships that had such a world-wide reputation from 1850 to 1860. Then the Civil War came on and our foreign trade was cut off for four years. After 1865 the grain trade attracted the larger sailing vessels from all over the world. This type of vessel was no longer an extreme clipper of the former

period, but a handsome, medium clipper of from 1,400 tons for the British ships to 1,600 and up to 2,000 tons register, for the American; capable of carrying a large cargo at a fair rate of speed. The Maine shipyards at this time turned out a large number of strong wooden sailing ships of from 1,600 to 2,400 tons. These vessels continued in the Atlantic-Pacific trade until the American Hawaiian Steamship Line commenced operations in 1900.

Modern Schooners.— The schooner, as previously mentioned, was a distinctively American product of a comparatively early date (1713). It was largely used in the coastwise trade, to the West Indies, to South America and later to Africa, and it may be said has not fallen from favor even to this day. The early vessels were not over on an average 75 tons. When it became necessary to increase the tonnage of the vessel it was thought to be advantageous to increase the power, so three masts were adopted. The earliest date of the building of a three-masted schooner in this country is thought to be about 1831. There were a few more built about 1845, and in 1847 the *Midas* was converted into a three-masted schooner, the *Zachary Taylor* was built at Philadelphia in 1849 and the *Spray* at Wilmington, Del., the same year. The period when this type of sailing vessel had passed the experimental stage appears to have been in 1853 when there were built the *Gardner Pike*, the *James H. Chadbourne*, the *Kate Brigham* and the *E. R. Bennett;* and in 1855 the *Eckford Webb* and the *William L. Burroughs;* and in 1856 the *Hartstein* and the *Cordelia*. The two latter were two-decked vessels and were the largest of the type built for some years. These vessels were used mainly in our coasting trade, as far south as the Gulf of Mexico ports. There were a few more built prior to 1860; the Civil War came on when but few, if any, were built. It was 1868 before three-masted schooners were again constructed, and by 1873 they were the most popular type of our coastwise sailing vessels. The first *four*-masted schooner was the *William L. White*, built at Bath, Me., and completed in June 1880. The Northern lakes also had four-masters immediately after the *William L. White*. Then it was some years before the pioneer *five*-master was constructed in 1888 at Waldoboro, Me., as the *Governor Ames*. The latter was the largest schooner for 12 years, until the *George W. Wells* was built in 1900 as a *six*-masted schooner. The largest of them all was the *Thomas W. Lawson*, built of steel in 1902, as a *seven*-masted schooner. This superb vessel foundered off the Scilly Islands in 1907.

Iron Hull Ships.—Although iron had been used in Great Britain for building hulls as far back as 1829 and came into common use in the early 40's, the first iron hull sailing vessel constructed in the United States was the schooner *Mahlon Betts* of 275 tons, built in 1854 at Wilmington, Del. Then there were none but wooden sailing vessels until the brig *Novelty* was built at Boston, Mass., in 1868, and the bark *Iron Age* constructed in 1869 for Tupper and Beattie of New York. The sloop yacht *Vindex* was then built in 1871 at Chester, Pa., by Reanie Son and Archibold; and in 1879 the yacht *Mischief* was built at Wilmington, Del. The three-masted schooner *Josephine* followed in 1880, being built by William Cramp and Sons Company. Then there came much larger vessels in the *Tillie E. Starbuck*, built in 1883 by John Roach and Son at Chester, Pa.; and in the same year by Gorringe and Company, as the American Shipbuilding Company, the *T. F. Oakes*. These vessels were about 2,000 tons register each.

The world's recorded tonnage of merchant sailing vessels in 1850 totaled 7,701,885; of which 3,396,650 tons were British; 3,009,507 tons American; 674,228 tons French; 298,315 tons Norwegian; 289,870 Dutch, and 33,315 Belgian.

In 1900, with more complete records, the total was 9,167,620, distributed thus: United States, 2,507,042 tons; United Kingdom, 2,096,408 tons; Norway, 1,002,675 tons; France, 636,081 tons; Germany, 593,770 tons; Italy, 568,164 tons; Japan, 320,572 tons; Sweden, 288,687 tons; Finland, 287,154 tons; Russia, 269,460 tons; Greece, 175,867 tons; Denmark, 158,303 tons; Spain, 95,187 tons; Holland, 78,493 tons; Portugal, 43,874 tons; Austria-Hungary, 25,342 tons; China, 20,541 tons.

In 1911, which is representative of pre-World War conditions, the total of the merchant sailing marine was 7,454,189 tons, distributed as follows: United States, 2,564,721 tons; United Kingdom, 962,718 tons; Norway, 738,197 tons; France, 624,521 tons; Germany, 510,059 tons; Japan, 451,529 tons; Italy, 410,791 tons; Finland, 327,625 tons; Russia, 254,330 tons; Sweden, 154,968 tons; Greece (1910), 145,284 tons; Denmark, 124,510 tons; Spain, 44,325 tons; Portugal, 43,844 tons; Holland, 42,312 tons; Austria-Hungary, 32,871 tons; China, 15,679 tons.

A comparison of decades shows that the zenith figures of the sailing fleets of the several maritime nations were as follows: United States, 1861, 4,662,669 tons; United Kingdom, 1870, 4,577,855 tons; Norway, 1890, 1,502,594 tons; Italy, 1870, 980,054 tons; Germany, 1880, 965,767 tons; France, 1860, 928,000 tons; Sweden, 1880, 461,593 tons; Holland, 1860, 423,790 tons; Greece, 1870, 398,703 tons; Russia, 1880, 378,894 tons; Finland, 1911, 327,625 tons; Spain, 1880, 326,438 tons; Austria-Hungary, 1870, 279,400 tons; Denmark, 1880, 197,509 tons; Portugal, 1900, 57,925 tons; Belgium, 1850, 33,315 tons.

A comparison of these figures will give a measurably accurate view of the rise and fall of the sailing vessel in the principal maritime countries.

In the United States the zenith of the building of sailing ships was reached in 1855, when 1,781 vessels, aggregating 510,690 tons, were launched. Of these, 381 were ships, 126 were brigs, 605 were schooners and 669 were sloops.

On 30 June 1917 there were on the register of the United States 134 square-rigged vessels; 82 of these being American built and 52 built abroad. These were 38 ships totaling 77,863 tons; 55 barks, totaling 68,993 tons; 38 barkentines, totaling 37,987 tons, and 3 brigs and brigantines, totaling 940 tons. The materials of which these vessels were built were: Of wood, 81; of iron, 28; of steel, 25.

The sailing vessels of the world, of 100 tons and upward registered for the year 1930–31,

were recorded by *Lloyd's Register* as 2,717 in number and of the aggregate of 1,583,840 tons. Of the whole number 793 were British, with a tonnage of 271,504; 706 American, tonnage, 843,547; 275 Italian, tonnage, 69,304; 150 French, tonnage, 60,288; 111 Finnish, tonnage, 70,031; 111 Swedish, tonnage, 29,625; 98 Portuguese, tonnage, 26,596; 96 Spanish, tonnage, 24,644; 62 Danish, tonnage, 16,485; 47 Estonian, tonnage, 11,107. The total number of sailing vessels in the American merchant marine in 1930 was 1,584, of which 1,472 were of wood and 112 of metal. The tonnage of these was 756,792. The greater number were under 100 tons. In 1930 there were constructed in American shipyards only 8 sailing vessels, with a gross tonnage of 210, as against 28 vessels with a tonnage of 2,869 in 1925.

J. H. MORRISON.

SAILOR'S CHOICE, the name of several excellent food fishes taken on the eastern and southeastern coasts of the United States, which are of small size and belong to the family of grunters. The best known, probably, is *Orthopristis chrysopterus,* also called pigfish, and especially common in the Gulf of Mexico. It is regarded as the best pan-fish of the region.

SAILOR'S CREEK, Battle of, the last great battle of the Civil War in the East. Sheridan says that it was «one of the severest conflicts of the war . . . so overshadowed by the stirring events of the surrender, three days later, that the battle has never been accorded the prominence it deserves.» When General Lee abandoned Richmond and Petersburg on the night of 2 April 1865, he ordered the concentration of his army at Amelia Court House, about 30 miles west of Petersburg, and it had collected at that point by noon of the 5th. On the night of the 5th Sheridan's cavalry and the Second, Fifth and Sixth corps of the army of the Potomac were at or near Jetersville, under orders to march early next morning on Amelia Court House. General Meade began the advance at 8.30 A.M., and when four miles out of Jetersville, Humphreys' Second corps, on the left, discovered that Lee was moving westward, passing by the flank of the Union army. The advance on Amelia Court House was suspended, and the army faced about; the Second corps was ordered to move on Deatonsville; the Fifth through Painesville, on the right of the Second; and the Sixth through Jetersville to the left of the Second. Sheridan's cavalry moved on the extreme left parallel to the Confederate line of retreat, impeding the march of the column wherever practicable, but Longstreet's corps succeeded in reaching Rice's Station, on the Lynchburg road, where he awaited the corps of R. H. Anderson, Ewell and John B. Gordon, the last-named commanding the rear-guard. The Second corps was checked at Flat Creek by the destruction of the bridge, but, soon repairing it, overtook Gordon and kept up a running fight with him for 14 miles, carrying several lightly intrenched positions, and capturing prisoners, colors, and wagons. The pursuit continued to Parkinson's Mill, on Sailor's Creek, where Gordon made a stand, but was soon driven across the creek, losing three guns, 13 colors, several hundred prisoners, and a large part of the trains of Lee's army. He attempted another stand beyond the creek, but fell back as Humphreys crossed, and marched for High Bridge. Pursuit ended at night. During the day the Second corps had captured 1,700 prisoners, four guns, 13 colors, and several hundred wagons and ambulances. While the Second corps was engaging Gordon, the Sixth corps, with the cavalry commands of Merritt and Crook, had come up some three miles to the left and overthrown the corps of R. H. Anderson and Ewell. Custer's division had interposed between Ewell and Gordon, destroying 400 wagons and taking prisoners and 16 guns; and Crook, moving rapidly to the left, found R. H. Anderson's command posted on high ground behind breastworks running across the Rice's Station road, and sent a dismounted brigade to take possession of and form across the road, thus cutting Anderson off from Longstreet. Ewell now proposed to Anderson that they make their way through the woods, around Sheridan's left, and get to Longstreet; but before anything could be done both were attacked. The Sixth corps had opened its artillery upon Ewell's 3,600 men, to which there was no reply, as Ewell was without artillery; and about 5 P.M. two divisions advanced, crossed Sailor's Creek, and attacked Ewell, who made a most determined resistance and, massing his troops, broke the centre of the Union line, but was checked by the artillery-fire from beyond the creek. The two divisions of the Sixth corps — Seymour's and Wheaton's — wheeled to the left and right respectively, enveloping Ewell's flanks; Stagg's cavalry brigade charged his right; and at the same time Merritt's and Crook's cavalry charged and routed R. H. Anderson's 6,300 men, killing wounding and capturing about 2,600. Ewell, now completely cut off and surrounded, surrendered his entire command. About 250 men of Kershaw's division, serving with him, escaped. Seven general officers were included in the surrender. The total loss of Lee's army was not less than 8,000 men. The Union loss did not exceed 900. Longstreet, who had remained at Rice's Station during the day, waiting for Anderson, Ewell and Gordon to unite with him, marched as soon as night set in, with Fields', Heth's and Wilcox's divisions, for Farmville. (See FARMVILLE AND HIGH BRIDGE). E. A. CARMAN.

SAILORS' SNUG HARBOR, a home for aged sailors on Staten Island, N. Y., established by Captain Richard Randall in 1800. The home is under government supervision and is in charge of a naval commander.

SAINFOIN, sān'foin, or **ESPARSETTE,** a leguminous plant (*Onobrychis sativa*), originating in the Mediterranean countries and cultivated for centuries. The stem is about two feet high, with pinnate leaves composed of small leaflets. The pea-like flowers are rather large and of a showy pink color, and are disposed in short spikes, on long axillary peduncles. It is nutritious fodder, well liked by livestock, especially sheep. It makes good hay, and will grow on light, warm, chalky soils, where other pasturage does not thrive; the roots are long-lived and are useful for binding light soils, while the foliage not only shades the pastures, but makes a good crop for plowing under. It is also recommended as a honey-producing plant for bee pastures.

SAINT, a person eminent for piety and other virtues. In the books of Scripture, both the Old and the New Testament, the whole body of the faithful people are called saints (2 Chron. vi. 41; Ps. xxxi, 3; Hebr. xiii, 14, «Salute all the saints»; Eph. i, 1, «the saints at Ephesus.») It is customary to give the title saint to all the apostles, evangelists and other holy persons, men and women, named in the New Testament, to most of the Fathers of the Church, to all the martyrs. In the Church of Rome the title of saint is formally and authoritatively bestowed on servants of God who in their lifetime were eminent for their Christian virtues and graces, and whose sanctity has been proved by miracles after their death (see CANONIZATION; BEATIFICATION); but thousands of saints are honored by that church, who lived in early times before the process of canonization was thought of. Intercession by the saints in heaven and invocation of the saints are articles of belief in the Catholic Church, Eastern and Western, as also in the schismatical Eastern churches: but that doctrine is repudiated by all the Protestant churches. The teaching of the Church of Rome, as proclaimed by the Council of Trent, is that the saints reigning with Christ «offer to God their prayers on behalf of men»; that it is good and useful «to call upon them with supplication,» and, in order to obtain benefits from God through Jesus Christ, «to have recourse to their prayers, help and aid.» Here the Church's doctrine regarding both intercession and invocation of saints is defined. Catholic divines find full warrant for this belief in the Christian sacred books; for the doctrine of intercession, in 1 Cor. xii, 12, where the unity of the Christian society is enforced; in James v, 16, where the prayer of the righteous is lauded; in Eph. vi, 18, and 1 Tim. ii, 1, where Saint Paul sets such store on the prayers of his fellow Christians; and it is asked: Can it be that the souls which have gone to God no longer exercise this kind of charity for their brethren on earth? If Scripture were silent on this question, the practice of the Church in all ages would suffice to remove all doubt as to the Apostolic origin of the belief in the intercession of saints. For the doctrine of the invocation of saints, theologians quote the word of Jesus Christ, that the angels in heaven rejoice when a sinner repents of his sin (Luke xv, 7). It were superfluous to cite the usage of the Catholic Church regarding invocation of saints: it began with the beginning of Christianity itself.

SAINT, The ('Der Heilige'). 'The Saint,' by Conrad F. Meyer (1879), is a short novel, about the length of 'Silas Marner,' centred around the great quarrel between Henry II and his Chancellor and Primate of England, Thomas Becket. In a broad sense based on history, its psychology is fancifully developed from a mediæval legend found by Meyer in 1853 in Thierry's 'Conquest of England' (Book IX), according to which Becket was the son of an Englishman and of the sister of the Kalif of Cordova. The story of Henry's amours with beautiful Rosamond Clifford in the hidden bower suggested the secret palace in which Meyer's Becket rears his daughter Grace to save her from royal lechery. The accidental slaying of Grace after her seduction by the king inspires in Becket a deep-laid plot for revenge under the veil of pretended loyalty and later of saintly devotion when he becomes Primate on Henry's nomination, whereby he drives the king to alternate fits of despair and fury over the loss of political advantages and of the love of his queen and sons. The tragic ending is historical.

The story is put in the mouth of a Swiss bowman, who is supposed to have come on his wanderings to London, where he entered the service of the king and was a minor actor in all the events he relates. The style is vivid, swift and powerful, and the diction of wonderful force and color, suggestive of a Gobelin tapestry, or as Keller said, «brocade.» It is Meyer's most finished production, possibly his best. The English reader will find it curious to compare it with Tennyson's 'Becket.' Consult 'Der Heilige' (66th ed., Leipzig 1913); American School Edition (ed. Eggert, New York 1907, with critical introduction); Frey, Adolf, 'Conrad Ferdinand Meyer' (Stuttgart 1900); Credner, Karl, 'C. F. Meyer, Der Heilige' (Berlin 1899); Langmesser, 'K. F. Meyer' (Berlin 1905).

CARL E. EGGERT.

SAINT ACHEUL, France, archæological site near Amiens which has given the name *acheulian* to the paleolithic deposits discovered there, containing flint implements evidencing human industry at a time corresponding to the second glacial period in France.

SAINT ALBANS, âl'bạnz, England, in Hertfordshire, 20 miles northwest of London, an ancient borough and market-town, standing on a height above the river Ver. Its abbey is one of the most remarkable Christian temples in England. Only a gateway remains of the original abbey, built in 793 in honor of Saint Alban, the first British Christian martyr. The present abbey has been so often extended and altered that it represents in its architecture many styles and various epochs of history, from the time of the Romans to that of Henry VII. It has the form of a Latin cross, with a length of 547 feet and breadth of 206 feet. Its tower has an elevation of 146 feet, crowned with battlements. Other churches are Saint Michael's, 10th century; Saint Stephen's, with some good Norman features, and Saint Peter's,

whose nave is of the Early Perpendicular. There is an Edward VI grammar school, and of modern buildings those deserving notice are the corn exchange, courthouse, prison, baths and public library, besides benevolent institutions, including hospitals and almshouses. The chief industries are silk manufacture, straw-plaiting, and there are breweries and iron foundries. Two battles were fought between the houses of York and Lancaster near Saint Albans; in that of 1455 Richard, Duke of York, defeated Henry VI, and in 1461 Margaret of Anjou defeated the army of York, commanded by Warwick. Southwest of the present city stood the ancient Verulamium, one of the oldest towns in Britain, on Watling street. In the abbey the printing press was set up on which the first English translation of the Bible was printed. Pop. (1951) 44,106.

SAINT ALBANS, Vt., city, port of entry, and Franklin County seat; altitude 409 feet; 32 miles north of Burlington; on the Central Vermont Railroad. Saint Albans is the trading and shipping center for an area in which hay and timber are produced and dairy farming and manufacture of maple products are carried on extensively. Here are railroad shops and offices; creameries and manufacture of poultry and stock feeds, maple products, and maple sugar-making equipment. The free public library maintains a collection of books and documents relating to the early history of the state. Beside public and parochial schools there is the Bellows Free Academy, a citizen's gift to the city. Taylor Park, in the center of the city, was given to the public by Col. Halloway Taylor in 1799; here at one time there was a town whipping post. St. Albans Raid on Oct. 19, 1864 was the most northerly engagement of the Civil War. In a scenic location, the city is favored as a summer resort. It was settled in 1763; incorporated as a town in 1788, and as a city in 1897, and is governed by mayor and council. Pop. (1940) 8,037; (1950) 8,552.

SAINT ALBANS, W. Va., city in Kanawha County; altitude 595 feet; situated at the confluence of the Coal and navigable Kanawha rivers, with steamboat service; 12 miles West of Charleston; on the Chesapeake and Ohio Railroad. It is situated in a coal mining region and in a great natural gas field. The city is largely residential, but has a lamp chimney factory, and machine shops. There is a large trade in dairy products, poultry and vegetables from the farms in the surrounding district. Very few of the inhabitants are foreign born. There are graded schools and a high school, also churches and schools for Negroes. Saint Albans is the oldest town in the Kanawha Valley and numbered Daniel Boone among its first residents. War industries in 1917–1918 inaugurated a boom period for the city and increased the population temporarily about 50 per cent. Under the revised charter of 1917 the government is vested in a mayor and six councilmen. Pop. (1940) 3,558; (1950) 9,870.

SAINT ALBANS, Confederate Raid on, a foray made Oct. 19, 1864, when Lieut. Bennett H. Young, with about 25 Confederates, nearly all of them escaped prisoners, armed with revolvers and carrying chemical preparations with which to set fire to town and farm-houses, crossed the Canada line into the town intending to burn it and rob the banks. Several citizens were killed or wounded, and three banks robbed of more than $200,000. An attempt to burn the town failed because of the defective character of the chemical preparations. Young and his party remained in town less than an hour, when they rode back to Canada on horses they had seized. Pursuit was made by United States troops, who captured some of the men on Canadian soil and turned them over to the authorities, by whom they were released on the technical ground of want of jurisdiction.

SAINT ANDREWS, Scotland, an ancient cathedral and university town in Fifeshire, located on the North Sea, 30 miles northeast of Edinburgh. Originating in the 7th century as the site of a Celtic monastery, it developed into an outstanding resort town of Great Britain.

It received its name in the 8th century when a stranger brought relics of Andrew the Apostle. In the 10th century, when St. Andrews had become a stronghold of the Celtic Church, the first cathedral was built, and during the reign of David I (1124–1153), a second cathedral was built. St. Andrews was also made a royal burgh. The third cathedral was completed in 1318. A castle built by Roger de Beaumont was destroyed by Edward I, and during the 14th century it was rebuilt, destroyed, and again rebuilt.

The first university in Scotland was founded at St. Andrews in 1412. It consists of St. Salvator's College, built in 1450; St. Leonard's College, founded in 1512; and St. Mary's College, founded in 1537. It is said that Queen Mary enjoyed respites from the cares of state by studying at St. Leonard's, which is one of the famous colleges for women in Great Britain. St. Mary's became a theological school, with the original college hall still in use. The university chapel, built in the 15th century, is the most beautiful building in the town.

During the Reformation, St. Andrews declined in importance. A Lollard and a Hussite were burned here in the 15th century, and in 1528, Patrick Hamilton was burned in front of St. Salvator's College. George Wishart was burned here in 1546, and the Cardinal Archbishop David Beaton was assassinated. Following a sermon by John Knox in 1559, the cathedral was partially sacked and destroyed; the castle was also demolished. Through these and later assults, the cathedral at St. Andrews which had been the largest church in Scotland became a ruin.

During the 19th century, St. Andrews developed as a health resort, and it has become famous as the birthplace of the game of golf. Pop. (1947) 8,693.

SAINT ANGELO CASTLE, Rome, Italy, a famous fortress situated on the right bank of the Tiber in the northwestern part of the city, opposite the bridge of Saint Angelo and a short distance from the main buildings of the Vatican. It was built by the Emperor Hadrian as a tomb for himself and his family. Originally it was a round stone tower covered with marble and surmounted by a number of statues, which, together with the marble covering, have disappeared, leaving the bare stone structure. When the Goths besieged Rome it was used

as a fortress, and has served this purpose ever since, being held and garrisoned by the party in power in the city. Since the time of Innocent III it has belonged to the popes, who strengthened the fortifications with outworks and connected the castle with the Vatican by an underground passage.

SAINT-ARNAUD, săn-tàr-nō′, **Armand Jacques Leroy de,** French soldier: b. Paris, France, Aug. 20, 1801; d. at sea, Sept. 29, 1854. He entered the French Army in 1817, but in 1822–1831 was engaged with the Greeks in their struggle for independence. He returned to the French Army in 1831, and in 1837 he went to Algeria, where he rose to the rank of maréchal-de-camp in 1847, and general of division in 1851, in recognition of his successful warfare against the Kabyle tribes. He was appointed minister of War Oct. 26, 1851, was active in promoting the *coup d'état* of December 2, and was made a marshal of France in 1852. He was placed in command of the French forces in the Crimean War and cooperated with Lord Raglan at the Battle of Alma, Sept. 20, 1854.

Consult *Lettres du Maréchal de Saint Arnaud* (Paris 1855).

SAINT ASAPH, sânt ăs′ăf, town, Wales, in Flintshire, six miles southeast of Rhyl, occupies an eminence in the Vale of Clwyd, near the confluence of the Clwyd and Elwy. It is built irregularly and has a venerable appearance. The cathedral, a small plain structure, dating from 1284, has been restored several times, and is one of the smallest in Great Britain.

SAINT-AUBAIN, săn-tō-băn′, **Andreas Nicolai de,** Danish author known by his pseudonym KARL BERNHARD: b. Copenhagen, Nov. 18, 1798; d. there, Nov. 25, 1865. He first appeared in literature as a contributor to the *Flyvende Post,* and finally obtained a large measure of success by his works of fiction, of which several dealt with higher Danish circles in modern times, while others were drawn from events of Danish history. He wrote *Kröniker fra Christian den Andens Tid* (*Chronicles from the Time of Christian II,* 1846), and *Kröniker fra Erik of Pomerens Tid* (*Chronicles from the Time of Erik of Pomerania,* 1850). A collection of his writings appeared at Copenhagen in 1856–1866.

SAINT AUGUSTINE, ā-gŭs-tēn or â-gŭs-tēn′, city, Florida, seat of Saint Johns County, on the Atlantic coast about 38 miles southeast of Jacksonville. It is situated on a peninsula formed by the San Sebastian River on the west, and the Matanzas River and the Intercoastal Waterway on the east and south. It is served by the Florida East Coast Railroad, and by U.S. Highway 1; also by several state highways. Saint Augustine is the oldest white settlement in the United States. It was founded September 8, 1565, by Don Pedro Menéndez de Avilés, captain general of the Spanish Fleet, and remained under Spanish control until 1763, when, together with the remainder of Florida, it was ceded to England. The British occupied the city until 1783, when Florida was re-ceded to Spain. By treaty of 1819 Spain ceded Florida to the United States in settlement of claims of United States citizens against Spain, not to exceed five million dollars. Possession was taken in 1821.

Established as a military post, Saint Augustine remained pretty much that until in the 1880's when the late Henry M. Flagler, one of the founders of the Standard Oil Company, decided to make it into a great winter resort. Until it became American, Saint Augustine experienced many vicissitudes. Menéndez had established it as a base for operations against the French who had set up a colony on the Saint Johns River. He called it Saint Augustine because he made the landfall on the feast day of the saint, August 28, 1565. In 1586, Sir Francis Drake sacked and burned the town. It was again sacked by pirates in 1668, and in 1702 was besieged by a band of Carolinians. Eventually they abandoned the siege, but before doing so, burned the town, making the third time it had been reduced to ashes by an invading force. In 1727, Colonel Palmer of Carolina made a sortie against the Spanish and Indians in Florida, and carried desolation and destruction to the very gates of Saint Augustine. And in 1740, Governor James Oglethorpe of Georgia led a joint expedition of Georgians and Carolinians against Saint Augustine but failed to win the city though he did take all of its outlying defenses. That he and others failed to capture the city itself was due to the fort which the Spaniards had erected at the northern approach to it, and which they called Castillo de San Marcos. It stands today, a splendid example of military architecture of its time, and was made a national monument in 1924. Of the numerous historical attractions in Saint Augustine, it is the foremost. It was begun in 1672 and was not completed for 87 years. It is built of coquina stone, quarried nearby. See also NATIONAL PARKS AND MONUMENTS.

In 1762 Spain and England were at war. The English captured Havana. England then proposed a treaty by which she would release Cuba to Spain in exchange for Florida. Spain agreed and the treaty was ratified February 10, 1763. Under the British, Saint Augustine prospered. In 1772, they exported 40,000 pounds of indigo which brought the highest prices on the London market. Other exports increased correspondingly. Soon after the United States acquired Florida the Seminole War broke out. This resulted in the Dade massacre on December 28, 1835, when Maj. Francis L. Dade, with a command of 139 men, was surprised by the Indians, and he and all but four of his men were killed. The Civil War had but little effect on Saint Augustine. In 1870, it had a population of but 1,800. The first railroad to reach the town was one 14 miles long extending to the town of Tocio on the Saint Johns River. This brought visitors, among them Mr. Flagler. The latter built the Ponce de Leon Hotel, a highly ornate structure that still stands. He also built the Alcázar, now a museum, and set up headquarters for his Florida East Coast Railroad, and for the chain of hotels which he erected along the Florida East Coast.

Because of its historical interest, Saint Augustine has become one of the most frequented resorts in the country. Among its many sights worth seeing, in addition to Castillo de San Marcos, may be mentioned, the Oldest House, the Oldest Wooden Schoolhouse, the City Gates, the Governor's House, the Old Spanish Inn, the Spanish Treasurer's House, Treasury Street, the narrowest in the city of many narrow streets, Ponce de Leon Circle, the Plaza de la Con-

SAINT AUGUSTINE

In old St. George Street, just inside the city gates, stands the oldest schoolhouse in the United States.

stitucion, the Catholic Cathedral, Trinity Episcopal Church, the Slave Market, the Fountain of Youth, and many other objects of real interest. Near Saint Augustine is the famous Alligator Farm, with literally thousands of alligators, one estimated to be 900 years old; also Casper's Gator and Jungle Ostrich Farm, while 18 miles south of the city is the famous Marine Studios, with thousands of fish of all varieties.

Saint Augustine has a commission-manager form of government. Its shrimp fisheries are extremely important. It builds boats, makes shell novelties, fishing tackle, and other small wares. Here are located the repair shops of the Florida East Coast Railroad. There are two hospitals—the Flagler and the East Coast. (The East Coast Hospital has been called the Saint Augustine Clinic since moving to new quarters). Pop. (1950) 13,418.

SAINT AUSTELL, ôs't'l, urban district, England, in Cornwall, 14 miles northeast of Truro, on Saint Austell Bay. It is the market town for a considerable agricultural district. China clay (kaolin) is produced in the neighborhood. Pop. (1951) 23,634.

SAINT BARTHELEMY, or SAINT-BARTHELEMY, săn bàr-tāl-mē', French West Indies, in the Department of Guadeloupe, Leeward Islands. It is about nine square miles in area, of irregular form and mountainous. Although nearly treeless it is fertile; vegetables are cultivated in some of the valleys, and bananas, Cassia, tamarinds, and sassafras are exported. Rocks and shallows make access to the island difficult for any but the larger coasting craft. Lead and zinc ores have been found in the island. The principal town is Gustavia, a seaport on the southwest coast; the only other town is Lorient. Saint Barthélemy was first occupied by the French in 1648. It was ceded to Sweden in 1784; and in 1877 it was reacquired by France through purchase. Slavery was abolished in 1848. The people are of French and Negro descent. Pop. (1938 est.) 2,479.

SAINT BARTHOLOMEW, Massacre of. Name given to the murder of the Huguenots in France which began on St. Bartholomew's Day, Aug. 24, 1572. Its authorship is usually attributed to the king's mother, Catherine de' Medici, but its causes were probably more complex. It began with a plot to murder Coligny, whose influence with the king was dreaded by the queen-mother and others. This failed, but it aroused a good deal of suspicion, and both sides prepared for bloodshed. Taking advantage of the presence of many Huguenots in Paris, they having come to attend the marriage of Henry of Navarre and the king's sister Marguerite, Catherine, backed by the Guises and others, persuaded Charles IX to strike at their foes. He consented, and the massacre began in Paris, and then spread to the provinces, lasting until October 3. One authority states that 50,000 were killed, but 25,000 is probably nearer the mark. Gregory XIII, misinformed, ordered a *Te Deum* and had a medal struck depicting an angel with cross and drawn sword slaying the Huguenots (q.v.).

SAINT BENEDICT'S COLLEGE, a Roman Catholic institution for men at Atchison, Kansas. It was founded in 1858 by the Benedictine Fathers. Four-year courses of study lead to the degree of bachelor of arts, while the degree of master of arts is conferred for two years' postgraduate study. . Enrollment (1950–1951) 515.

SAINT BERNARD, city, Ohio, in Hamilton County; 6 miles north of Cincinnati; on the Baltimore and Ohio; New York Central; Norfolk and Western; and Pennsylvania railroads. There are manufactures of soap, stearic acid, chemicals, car wheels and lumber. Near by is Ivorydale, soap manufacturing center. Pop. (1940) 7,387; (1950) 7,066.

SAINT BERNARD, săn bĕr-nàr', the name of two passes across the Swiss Alps, connecting Valais, Switzerland, with Piedmont department, Italy, known respectively as Great Saint Bernard and Little Saint Bernard.

Great Saint Bernard (French Grand-Saint-Bernard), 8,111 feet above sea level, was known to the Romans as *Alpis Poenina.* It is 15 miles east of Mont Blanc, and leads from Martigny, Switzerland, to Aosta, Italy, a distance of 50 miles; on the east side of the pass is Mount Velan, and on the west side the Point de Dronaz. It was known to the Romans as early as 57 B.C., when it was crossed by Servius Galba on the instructions of Julius Caesar. A military road was in existence by 79 A.D., traces of parts of it still being visible. There are remains of a temple of Jupiter Poeninus on the plain at the top of the pass, dating from the early days of the Roman Empire; it was excavated in 1890–1893. Votive tablets, some of which date from the time of Tiberius, bronze objects of the first Iron Age, Gaulish coins, and other antiques found in the vicinity, were deposited in the museum of the hospice which stands at the summit of the pass. This famous hospice, one of the highest permanently inhabited places in Europe, was founded in 962 by Saint Bernard of Menthon, and was maintained primarily for the relief of travelers lost in the snows or exhausted by the rigors of the journey. It is in charge of Augustinian monks who, with their celebrated dogs, have saved countless lives. When, with improved roads and communications, there was a decreased demand for these humane services, the monks established a hospice in the mountains of Tibet.

Little Saint Bernard (French Petit-Saint-Bernard), 7,177 feet high, was known to the Romans as *Alpis Graia.* Situated about 10 miles south of Mont Blanc, it connects the valley of the Isère, on the west, with that of the Dora Baltea, in the east. The pass across it is one of the easiest in the Alps. It is believed to have been the pass by which Hannibal led his forces into Italy in 218 B.C. There are remains of a Roman road and temple; and it, too, has a hospice founded in the 11th century, and administered by the Order of St. Maurice and St. Lazarus.

SAINT BERNARD DOG, a race of large dogs which gets its name from the Hospice of Saint Bernard, where it has long been kept by the monks to aid them in rescuing perishing travelers. This dog is very valuable in assisting the monks to keep to the line of the road and in finding their way back. They are seldom burdened. Dogs of other races are used for the same purpose in other parts of the Alps. The Saint Bernard dog is of two varieties: the rough and the smooth coated; the first, which has long white hair with black or tawny spots are few in

number. This famous dog, according to the traditions of the monastery, is the result of a cross between a Danish-bull bitch and a mastiff, a native hill dog, though at what time effected it is impossible to say. After the breed was once established it was kept pure till 1812. About 1860 these dogs first attracted attention of English travelers, who imported them to Great Britain, where they were exhibited and at once excited much notice on account of their size and beauty. Others were introduced, and the Saint Bernard was soon established as the most popular big dog, a popularity which has gone on increasing. The Saint Bernard, as bred to modern English ideas, is an immense red or orange colored dog, marked with white on muzzle, neck, chest, feet and tip of tail. The head should be massive and imposing, with a strong square muzzle, a point of great importance. Legs should be straight, with large feet, and double or, at least single, dew claws. Hind feet should turn out, though not sufficiently to hinder the dog's movements. The coat of the rough variety is of medium length; it should not be too curly. In the smooth variety the coat should be short and wiry. See also Dog—*Working Dog Group.*

SAINT BONIFACE, city, Province of Manitoba, Canada, county seat of Provencher County, on the east bank of the Red River, immediately opposite the city of Winnipeg with which it is joined by three bridges and by the Canadian National and Canadian Pacific railways, bus, and street railway services. Originating in a mission and settlement founded by the Abbé Provencher in 1818, and now the seat of a Roman Catholic archdiocese, with a cathedral which is one of the largest of church buildings in Canada, it was incorporated as a city in 1908, and is noted as the chief marketing center for livestock in the province and for its meatpacking and miscellaneous industries. The city has three public schools and a collegiate institute, a seminary, a normal school, a Roman Catholic college, a weekly newspaper, and two hospitals. The harbor on the Red River is administered by a commission of five of which Winnipeg appoints three members and St. Boniface two. Population (1951) 26,342.

SAINT BRIEUC, săn-brē-û′, city, France, capital of the Department Côtes-du-Nord, 55 miles northwest of Rennes. It is built on a hill rising 290 feet above the right bank of the river Gorrët, a mile from its outlet, in its port of Le Légué, on the bay of Mont Saint Michel. A considerable coasting trade is carried on in fish, garden and farm products, and the manufacturing industries include iron, steel and agricultural implement works, lumber, brush and wool factories. The city dates from a monastery established by the Welsh missionary Saint Brieuc, in the 5th century, and has had a turbulent history, especially during the 18th century Reign of Terror. The 13th century restored cathedral, a church of the same period, the modern church of Saint Michael, the bishop's palace, the city hall with its museum and picture gallery, the military barracks, formerly an Ursuline convent, a statue of Du Guesclin, and the colossal statue of the Virgin on a dominating northern hill are among the chief features. Pop. (1946) 28,596.

SAINT CASIMIR, Institute of the Sisters of. See Orders, Religious.—*Roman Catholic Orders*—Orders of Women.

SAINT CATHARINES, city, Province of Ontario, Lincoln County seat, on the Welland Ship Canal, and on several branches of the Canadian National Railway, 12 miles northwest of Niagara Falls, 32 miles east of Hamilton. St. Catharines is noted for its mineral wells, has large hotels and is in a picturesque and fertile region. Manufactures include electrical equipment, tools, locks, drop forgings, textiles and leather. It is the center of the Niagara Peninsula fruit trade; ocean-going boats in the Welland Ship Canal stop at its docks. Educational facilities include numerous public and private schools, among them Ridley College. Pop. (1951) 37,984.

SAINT CHAMOND, săn shà-môn′, France, in the Department of Loire, eight miles northeast of St. Etienne by rail, at the confluence of the Gier and Janon, is a well-built manufacturing city. There are large coal mines in the vicinity, famous dye-works and extensive metallurgical manufactures and various other industrial works, including large mills for the manufacture of silk and lace. The remains of a Roman aqueduct are found at St. Chamond. Pop. (1946) 14,546.

SAINT CHARLES, city, Illinois, in Kane County; altitude 802 feet; on the Fox River; 38 miles west of Chicago; on the Chicago and North Western and Chicago Great Western railroads; has airport. Metal kitchen and dining furniture, custom kitchens, molded fiber products, plastic enclosures, water softeners, letterpress and offset printing, and sound equipment are made here. The city has a memorial community center and also a fine municipal building of Georgia marble. It is the home of a livestock center where pure bred cattle are bought and sold in sales sponsored by breeding associations. Pop. (1940) 5,870; (1950) 6,709.

SAINT CHARLES, city, Missouri, Saint Charles County seat; alt. 504 feet; on the Missouri River; 23 miles northwest of St. Louis; on the Wabash; and the Missouri, Kansas and Texas railroads; state and federal highways; and with both railroad and highway bridges across the river. The industrial and shipping center of an agricultural district devoted to grain and general farm crops, the city also has railroad car and foundry companies, and manufactures shoes and steel dies. There are, as well, deposits of sand, gravel and coal. Cultural facilities include a public library; the Sacred Heart Academy, founded in 1818; and Lindenwood Female College, an institution of higher learning, established as a school for girls by Maj. and Mrs. George C. Sibley in 1827. It received the Sibley estate as an endowment and is under the auspices of the St. Louis Presbytery. St. Charles was settled in 1769 by the French, under the leadership of Louis Blanchette; came under the Spanish rule for a brief period; was receded to the French; and became a part of the United States with the Louisiana Purchase. It was incorporated in 1795; was the first capital of the state, in 1820–1826; and received its city charter in 1849. Government is by mayor and council, and the water supply is municipally owned. Pop. (1940) 10,803; (1950) 14,314.

SAINT CHARLES, Engagement at, occurred during the American Civil War; it was fought on June 17, 1862, on the White River at Saint Charles, Arkansas County, Ark. On the orders of Gen. Henry Wager Halleck (q.v.), Capt. Charles Henry Davis, commanding the Federal flotilla on the Mississippi, despatched two ironclad vessels and two wooden gunboats to open the White River for communication. At Saint Charles they encountered a fortified Confederate position and took it by assault after the *Mound City,* one of the ironclads, had been crippled by gunfire; this successful action gave control of the White River to the Federals.

SAINT CHARLES COLLEGE, Catonsville, Md., is the classical department of Saint Mary's University and Theological Seminary of Saint Sulpice, at Baltimore, Md. It was founded on July 11, 1831, at Ellicott City, Md., the land and an endowment of $5,349 being provided by Charles Carroll (q.v.), one of the signers of the Declaration of Independence. The institution was not opened until October 1848. After destruction of the buildings by fire on March 11, 1911, the college was removed to Catonsville. In 1946–1947 there were a faculty of 12 and student enrollment of 200 men.

SAINT CHRISTOPHER, popularly known as **SAINT KITTS,** British West Indies, an island of the Leeward Islands colony, situated 46 miles west-northwest of Antigua. The length is 23 miles and breadth 5 miles, the area being 68 square miles. It is traversed by a densely-rugged mountain range whose highest summit, Mount Misery, has an altitude of 3,771 feet. The island has a healthful climate, and considerable cultivation is carried on in the coastal lowlands. Sugarcane is the principal economic crop, and other products include cotton, cacao, coffee, tobacco, limes, and coconuts. Basseterre (pop. 12,000), a town on the southwest coast, is the capital and principal seaport; other towns are Old Road and Sandy Point. Administratively, Saint Christopher and Nevis (q.v.), lying 2 miles to the southeast, constitute (together with the dependent island of Anguilla) one of the four presidencies of the Leeward Islands colony; the presidency has an aggregate area of 152 square miles, and the population numbers 46,300. Head of the government of the presidency is an administrator, who is assisted by a Legislative Council of 11 members comprising 3 officials and 8 unofficials (5 of the latter being elected and 3 nominated). Sugar companies operate 36 miles of railways in Saint Christopher; and there are some 60 miles of highway suitable for automobile traffic. Air transportation services link Basseterre with other islands of the British West Indies and with Willemstad, Curaçao. The island was discovered by Christopher Columbus in 1493. British settlers were taken there in 1624 by Sir Thomas Warner (d. 1649), and Frenchmen arrived shortly afterward. Both Britain and France exercised sovereignty over parts of Saint Christopher until 1713 when, by the Treaty of Utrecht (q.v.), all French rights to the island were ceded to Great Britain. Pop. (1944) 17,992.

ST. CLAIR, Arthur, American army officer: b. Thurso, Caithness, Scotland, March 23, 1736; d. Greensburg, Pa., Aug. 31, 1818. A grandson of the Earl of Roslyn, he attended the University of Edinburgh and studied medicine prior to 1757, when he became an ensign in the British Army. He sailed for America in the fleet of Admiral Edward Boscawen (q.v.), and during 1758 served under Baron Amherst (q.v.) at the capture of Louisburg and under James Wolfe (q.v.) in the successful assault on Quebec. Resigning his commission in 1762, he settled first at Boston, Mass., where he married a niece of James B[illegible]doin (q.v.), later governor of Massachusetts. Two years later he moved to the Ligonier Valley of western Pennsylvania, where he had been assigned large grants of land because of his military service. The largest resident landowner in Pennsylvania west of the Alleghenies, he became surveyor of the district of Cumberland in 1770 and judge of quarter sessions and common pleas in 1773. With outbreak of the Revolution he cast his lot with the colonies, and thus was drawn into a military and political career that brought him prominence but little fame, many humiliations and disappointments, and ultimately poverty and oblivion. Appointed colonel of the 2d Pennsylvania Regiment in 1775, he served under John Sullivan in the disastrous raid into Canada; promoted brigadier general in 1776, he organized the New Jersey militia and fought at Trenton and Princeton. Becoming major general in 1777, he succeeded Gen. Horatio Gates (q.v.) in command at Ticonderoga, but with the approach of British troops under Gen. John Burgoyne (q.v.) he evacuated the fort (which had been considered impregnable) without a fight; for this action, he was court-martialed in 1778 but was fully exonerated. In 1780 he served on the court-martial which convicted Major John André (q.v.), and during 1781–1782 he was in command of forces serving in Georgia and the Carolinas under Nathanael Greene (q.v.). He was made a member of the Continental Congress in 1785, and became its president in 1787. That same year he was appointed the first governor of Northwest Territory, and this post he continued to hold for 15 years; in 1790 he selected as site for his headquarters a place to which he gave the name Cincinnati, thus commemorating the Society of the Cincinnati, of which he had been president for Pennsylvania from 1783 to 1789. As major general in command of federal troops during 1791 he conducted a campaign against the Miamis, but on November 4 he was thoroughly routed at Saint Mary's by Little Turtle (q.v.) in one of the most severe defeats ever inflicted on white men by Indians; the next year he resigned his army command although Congress had freed him of blame. He continued as territorial governor, however, but he was overbearing in his treatment of the white inhabitants and outraged them by his unyielding tactics. When Congress, ignoring his protests, finally arranged for establishment of the State of Ohio, he announced to the Constitutional Convention that the act of Congress was illegal; because of this action, in 1802 the long-patient President Jefferson removed him from the governorship. Thereafter he lived in poverty for some years until Congress acknowledged his claim for the refund of monies expended. He wrote *A Narrative of the Manner in Which the Campaign Against the Indians in the Year 1791 was Conducted* (1812). Consult Burger, Nash K., *Arthur St. Clair* (Richmond 1945).

SAINT CLAIR, city, Michigan, in St. Clair County; altitude 604 feet; on the St. Clair River (q.v.); 11 miles south of Port Huron; on the Port Huron and Detroit Railroad, with ferry to Courtwright, in Ontario, Canada. Nearby farms produce grains, hay and vegetables. Exploitation of large salt deposits underlying the city is the foremost industrial activity. The city has standard schools, recreational facilities, and civic and social welfare institutions.

A British fort was established here in the 1760's, to safeguard transport of supplies, but was abandoned after some 20 years of use. St. Clair was platted in 1818, and replatted 10 years later. In its early years it was a lumber center. Incorporation as a city was effected in 1858. Pop. (1940) 3,471; (1950) 4,098.

SAINT CLAIR, borough, Pennsylvania, in Schuylkill County, altitude 749 feet, three miles north of Pottsville. It is served by the Philadelphia and Reading Railroad. It is an anthracite region and the chief industries are connected with the mining and shipping of coal. The government is by president and council. Pop. (1950) 5,856.

SAINT CLAIR, river, Michigan (called originally SINCLAIR), in honor of Patrick Sinclair, a British officer, who in 1765 purchased from the Indians a tract of land along the river. The river is the outlet of Lake Huron, and discharges its waters by several channels into Lake St. Clair The delta at the mouth is known as the Saint Clair Flats. A number of summer cottages and hotels have been built on the Flats. One of the channels has been improved for navigation; a canal about one and one half miles long has been built at such an angle as to shorten the course, and of such a width and depth as to admit large lake steamers. A railroad tunnel under the river connects Port Huron in the United States with Sarnia in Canada. It is nearly two miles long, including approaches, and was opened for travel in 1891. The river is about 40 miles long.

SAINT CLAIR, sânt klâr′, **Lake,** between Michigan and Ontario, Canada, and between Lake Huron and Lake Erie. It receives the waters of Lake Huron through St. Clair River and discharges its waters into Lake Erie through Detroit River. It is about 30 miles long, from north to south; its maximum width is 24 miles and the average width 12 miles; area, 460 square miles. It is about three feet higher than Lake Erie and five feet four inches lower than Lake Huron. The northern part is shallow, owing to the sediment from St. Clair River; the average depth of the central part is 26 feet. The bed is covered with a blue mud, with sand and gravel in some parts, all supporting a dense growth of low vegetation in which are many forms of animal life. The lake is noted for the large number of steamers and the enormous tonnage which it carries each year.

SAINT CLOUD, săn klōō′, city, France, in the Department of Seine-et-Oise, on a height near the Seine, seven miles west of Paris, is charmingly situated and especially interesting for its historical associations. It commands a superb view of Paris, and the beautiful shady park, with its château and elegant fountains, is a favorite resort of Parisians. Within the precincts of St. Cloud are situated the new national Sèvres porcelain manufactory. The château was built by Gondi in 1572, purchased by the duke of Orléans, the brother of Louis XIV in 1658, and by Louis XVI for Marie Antoinette in 1782. Henry III was murdered in the old mansion by Jacques Clement Aug. 21, 1589 Peter the Great was received there in 1717. It was the scene of Napoleon's coup of the 18th Brumaire, and his favorite residence; here he caused himself to be declared first consul, and here Blücher had his headquarters (1815). At St. Cloud, Charles X (1830) affixed his signature to the ordinances which doomed him. Here Napoleon III signed the declaration of war against Prussia (1870). Pop. (1946) 17,101.

SAINT CLOUD, sânt kloud′, city, Minnesota, and Stearns County seat, altitude 1,032 feet, on the Mississippi River, 70 miles northwest of the Twin Cities, Minneapolis and St. Paul. It is served by the Great Northern and Northern Pacific railways, by three bus lines and one airline.

In 1870 the first granite quarry was opened in St. Cloud. Today the famous St. Cloud granite is known throughout the world and the city ranks first in the nation in the production of colored granite and second in the production and processing of all types of granite.

Because of the city's strategic position in the center of the state, St. Cloud has become an important focal point for both industry and the large tourist trade. It is Minnesota's fifth largest city

Industry is widely diversified. There are large railway car manufacturing shops. Other important industries include an optical works, factories for the production of floor sanding machines, refrigerators, boats, playground equipment, brooms, airline tanks, neon signs, frost shields, and many other products. The processing of dairy products is of major importance as St. Cloud is located in the heart of one of the largest dairying regions in the United States.

The city is well-equipped with modern schools, both public and parochial grade and high. The St. Cloud State Teachers College is located here. St. John's University for men and St. Benedict's College for women are situated in beautiful settings within a few miles of the city. A county historical museum is located in the city. The Carnegie library, opened in 1902, has paintings and mementoes of St. Cloud in France, for which this Minnesota city was named. The courthouse is built of Minnesota granite, as is the post office. The courthouse, library, and post office are grouped centrally, near the river. Local institutions are the fine modern St. Cloud Hospital; an orphanage, and a neighborhood house. The women's club guild conducts an active philanthropy, and there is a civic music association. State and federal institutions are a reformatory and a veterans hospital.

St. Cloud was settled in 1852, platted in 1854, incorporated as a village in 1868 and chartered as a city in 1889. Since 1912 it has had a commission-council form of government. Before the days of the railroads it was the terminus of the Hudson's Bay Company for unloading the furs brought down from the Red River Valley in wooden oxcarts. The first stage line came through in 1851, and in 1866 the railroad reached St. Cloud. Pop. (1940), 24,173; (1950) 28,410.

SAINT CROIX, sânt kroi′, (1) a river, the outlet of Grand Lake, flows south, east-southeast, and forms part of the boundary between Maine and New Brunswick. It empties into Passamaquoddy Bay It is 75 miles long; navigable as far as Calais, Me., above which there is extensive water power. (2) A river which rises in Douglas County, Wisconsin, flows southwest to the Minnesota border, then south, forming the boundary between Wisconsin and Minnesota for a distance of about 100 miles, entering Mississippi River at Prescott, Wisconsin. It is about 150 miles long and navigable to the Falls or the Dalles, a distance of 54 miles from its mouth. At the Falls there is a descent of 50 feet in 900 feet, and below there is a canyon.

SAINT CROIX, sânt kroi′, the largest of the Virgin Islands of the United States, lying 60 miles east by south of Puerto Rico; area 81.93 square miles. It is hilly except in the southern part; well-watered, and fertile, and has a larger proportion of land under cultivation than the other islands of the group. Sugar is the chief product; tobacco, cotton and fruits are also cultivated. Some cattle are raised.

The island was discovered by Columbus in 1493, and was occupied by the Dutch, the English, the Spaniards, and the French. Ceded to Denmark by France, it was occupied by the English in 1807, but finally restored to Denmark by the Treaty of Paris. It came into the possession of the United States by purchase on March 31, 1917. Pop. (1950) 12,096. See also Virgin Islands of the United States.

SAINT-CYR, săn-sēr′, Marquis **Laurent de Gouvion,** marshal of France: b. Toul, France, April 13, 1764; d. Hyères, France, March 17, 1830. In 1807 and 1808 he fought in the Polish campaign and in the Russian campaign of 1812 in which he distinguished himself by winning the Battle of Polotsk in recognition of which he was made a marshal. After the overthrow of Napoleon he made his peace with the new regime, was minister of war in 1815, and was created a marquis in 1817. His *Memoirs* are records of the campaigns in which he fought.

SAINT-CYR, or **SAINT-CYR-L'ECOLE,** săn-sēr′ lā-kôl′, town, France, in Seine-et-Oise Department, 3 miles west of Versailles, at the end of the old park of Louis XIV, celebrated for its military school. Madame de Maintenon founded here (1686) a seminary for the education of the daughters of families of high rank in reduced circumstances. The convent chapel contained the tomb of Madame de Maintenon, and Racine's *Esther* and *Athalie* were written for the pupils of the school and first acted there. During the Revolution this institution was abolished, and in 1806 Napoleon transferred to St.-Cyr the famous military academy which he had founded at Fontainebleau. Two advanced forts of the new enceinte around Paris are situated at St.-Cyr. Pop. (1946) 4,288.

SAINT DAVID'S, dā′vĭdz (anc. Menevia), town and parish, Wales, in Pembrokeshire, 14 miles west-northwest of Haverford. Its famous 12th century cathedral is one of the most beautiful in Wales. Pop. (1951) 1,580.

SAINT-DENIS, săn-dē′, city, France, in the Department of Seine, four and one half miles north of Paris, is an important junction on the Northern Railroad. The town is especially celebrated for its venerable abbey, from which it derives its name; the two high towers are respectively Romanesque and Gothic; the rose window dates from the 13th century. The abbey was the burial place of the kings of France and in the chapels of the nave are the tombs of Louis XII, and Anne of Brittany (1591); of Henry II; Catharine de Medici; Louis of Orleans; Francis I; and Claude of France—one of the splendid tombs of the Renaissance; and that of Dagobert, one of the most curious of mediaeval (13th century) works of art. The crypt dates partly from the time of Charlemagne. In the center is the vault, where the last king reposes—Louis XVIII, the only one whose ashes have been respected. The crypt also contains the Bourbon vault, where reposes Louis XVI and Marie Antoinette. Modern features deserving notice are an orphanage (1886), the monument commemorative of the revolution and other public statues, and the railway station. Pop. (1946) 68,595.

SAINT-DENIS, city, capital of the French island of Réunion in the Indian Ocean, on the north coast of the island. It is built on a long, narrow beach shut off on the land side by a range of high volcanic mountains. In the city are a cathedral, a palace for the governor, a theatre, and a large number of educational institutions, including a lyceum, several large schools, a library, a museum, and a botanical garden. The harbor is an open roadstead exposed to frequent severe storms, but a new, protected harbor has been constructed at Pointe des Gallets, a few miles to the west, which is connected with the city by a railroad. Pop. (1946) 25,332.

SAINT-DIZIER, săn-dē-zyā′, town, France (ancient Desiderii Fanum), Department of Haute-Marne, on the Marne, 35 miles southeast of Châlons. Part of the old castle is standing and the church has some peculiar Gothic windows. There is a library and a museum. It is an important center of the iron trade, with foundries of iron, steel, copper and bronze, engineering works, etc. It is a railway station. In 1544 St. Dizier was besieged and taken by Charles V, although strongly fortified. In 1814 there was severe fighting nearby, between Napoleon and the Allies. The walls have been razed and the site now constitutes the promenade of the town. Pop. (1946) 15,936.

SAINT ELIAS, Mount, in Alaska, in the southeastern part of the territory; long. 140° 55′ 47.3″ W.; lat. 60° 17′ 35.1″ N. The United States Coast and Geodetic Survey report the height 18,108 feet above sea level. It rises from an elevation of considerable height, and the foot-hills on the south side are covered with trees. The timber line is from 2,000 to 2,500 feet above sea level. The mountain itself is covered with snow and ice and has many glaciers The south side is almost perpendicular; the storms of ages and the avalanches have removed many of its rugged features. The north side is more accessible, and has been explored to some extent The Malaspina Glacier is on the slope and at the foot of Mount Saint Elias, near Yakutat Bay.

SAINT ELMO CASTLE, Naples, Italy, a fortress crowning a rocky hill on the western outskirts, built by Robert the Wise (1343).

SAINT ELMO'S FIRE, the popular name of an electric appearance, especially in southern climates, during thunderstorms, of a brush or star of light at the tops of masts, spires, or other objects.

SAINT-ETIENNE, săn-tā-tyĕn′, France, manufacturing city of the department of the Loire, and its capital, situated on the Furens, 36 miles southwest of Lyon. It is located amid some of the richest coal fields of France. The important buildings include the old abbey of Valbenoite, dating partly from the 13th century, a Protestant church, a synagogue, a town house, a school of mines with fine collections, and an art palace, with a museum and library, rich in old manuscripts, collections of natural history, and of ancient artillery. The enormous metallurgical establishments yield one third of the whole French production of steel. Here are also the national gun factory and other metal works. The manufacture of hemp cables, pottery, and lime, the weaving of ribbon, laces, trimmings, and conditioning of silk are among the active industries of the city. Pop. (1946), 177,966.

SAINT EUSTATIUS, sânt ū-stā′shĭ-ŭs, Netherlands Antilles, island 12 miles west of St. Kitts and 16 miles southeast of Saba, 12 square miles in area. It is of volcanic origin. In the southern part is an extinct cone 1,975 feet in height; and in the northern part a second rises to 965 feet. The land is used principally for the pasturing of sheep, goats, and cattle, the former plantations of tobacco, sugarcane, and other crops having long since disappeared. Oranjestad, the capital, was at one period the chief commercial port of the West Indies.

Saint Eustatius, known to its inhabitants as Statia, was first occupied by the Dutch in 1635. It became an important trading center in the 18th century, and during the American Revolution the island was one of the chief sources of supply for the forces of General Washington. Here, on Nov. 16, 1776, the Dutch governor, Johannes de Graeff, ordered the first foreign salute to be fired in honor of the "Congress flag," this being flown by the brig *Andrea Doria,* commanded by Capt. Josiah Robinson. On Feb. 3, 1781, the island was captured by a British fleet commanded by Admiral Sir George Rodney, and this struck a blow to its prosperity from which it did not recover after return to Dutch sovereignty in 1814. Pop. 1,209. See also Netherlands Antilles.

SAINT-EVREMOND, Charles de Marguetel de Saint-Denis, Seigneur de, săn-tā-vrē-môn′, French wit and littérateur: b. Saint-Denis-le-Guast, April 1, 1610; d. London, England, Sept. 29, 1703. He fought in the Thirty Years' War and became a favorite of the prince de Condé (duc d'Enghien), but, though a royalist, he fell into disfavor because of his criticism of the Peace of the Pyrenees (q.v.) and in 1661 fled the country. By way of the Netherlands he reached England, where he became a favorite of Charles II. During 1664–1670 he resided in the Netherlands, and thereafter once more he lived in England until his death. For long he was closely associated with Hortense Mancini, duchess of Mazarin, a leader of fashion in London. He wrote dramas, essays and letters that earned him European fame as scholar and wit.

SAINT-EXUPERY, săn-tăg-zü-pā-rē, **Antoine de,** French aviator and writer: b. Lyon, 1900; d. southern France, August 1944. Becoming a commercial pilot in 1926 after service as a military flyer, he was employed on the routes to West Africa, South America, and the Sahara. Drawing from these experiences, he was inspired to write three notable books known in English translation as *Night Flight* (1932), *Southern Mail* (1933), and *Wind, Sand, and Stars* (1939). The poetic quality of these works earned for him the Prix Femina-Vie Heureuse in 1931 and the award of the grand prize of the French Academy in 1939. Rejoining the French Army air service at outbreak of World War II, his plane was shot down in May 1940 as the resistance of France to the German onslaught was drawing to its close. Making his escape from France, by way of Portugal he reached the United States, and there wrote *Flight to Arras* (1942), a dramatic account of his last reconnaissance flight. He also wrote *Airman's Odyssey* (1943), recounting his escape, and *The Little Prince* (1943), the latter a child's fantasy. Joining the French forces resisting the Germans in France, he was reported missing when engaged in a flying mission over southern France.

SAINT FRANCIS, a river rising in southeastern Missouri and flowing 450 miles to join the Mississippi at Helena, Ark. It is navigable for 150 miles.

SAINT FRANCIS COLLEGE, Brooklyn, N. Y., was founded by the Jesuits in 1847 and was granted powers of a university in 1861. Originally on the island of Manhattan, it was removed to Brooklyn in 1913. There is a faculty of 40 and a student enrollment of 850.

SAINT FRANCIS OF ASSISI. See Canticle of the Sun; Francis of Assisi.

SAINT GALLEN, sânt gäl-ĕn (French, Saint Gall, săn gàl′), Switzerland, name of a canton and of its capital. 1. The canton, in the northeast, is bounded by Lake Constance (Boden See), the Rhine, and the lakes of Zürich and Walen. With an area of 777 square miles, it has a diversified surface, the southern and central portions being covered by lofty Alpine ranges. While the climate of the valley is mild, it is rigorous in the mountainous district. There are good pastures, vineyards, and orchards. The canton, which was admitted to the Swiss Confederation in 1803, sends 13 representatives to the Nationalrat (National Council). German is the main language, and the majority of the inhabitants are Roman Catholic. Pop. (1941) 286,201. 2. The town, on the Steinach 50 miles east of Zürich, is the see of a bishop. Until 1846 the cathedral was the abbey church of the ancient Benedictine abbey, suppressed in the 18th century. The abbey library contains some of the oldest and most precious manuscripts in the world, as well as many early printed books. One of the principal industrial towns of Switzerland, Saint Gallen manufactures linen, woolen, and cotton goods, laces, embroideries, and fine muslins. Pop. (1941) 62,530.

SAINT-GAUDENS, sânt-gô'dĕnz, **Augustus,** American sculptor: b. Dublin, Ireland, March 1, 1848; d. Cornish, N. H., Aug. 3, 1907. He was brought to the United States in infancy. At 13 he was bound in apprenticeship to learn cameo-cutting, and he spent several years at this art. Six years later (1867) he went to Paris and studied under the sculptor François Jouffroy at the École des Beaux Arts. While at Rome in 1871 he produced his first figure, *Hiawatha,* and the following year he returned to the United States. He had a studio in New York City until 1885, and thereafter at Cornish, N. H. Saint-Gaudens was a sculptor of originality and freshness, who had adopted the best standards of French taste and method of execution without being hidebound by tradition. He had a style at once polished and free. Among his other works are the *President Lincoln* statue in Lincoln Park, Chicago, Ill.; the bas-relief *Adoration of the Cross by Angels;* the *Shaw Monument* at Boston, Mass.; and the *Diana* on the tower of the old Madison Square Garden, New York City. He also took part in executing the *Parnell Memorial* monument in 1901, designed several medals of presentation authorized by Congress, and assisted John La Farge in decorating Trinity Church, Boston.

What perhaps is the most striking characteristic of all his ideal statues is *The Puritan* (at Springfield, Mass.). It represents the Puritan of earlier New England in all his aggressive and unbending strength—soldier, theologian, statesman. There is nothing winning or conciliating in his air. He is come to conquer the wilderness as Cromwell conquered the aristocracy of England and wiped out for the brief period of the commonwealth the haughtiest of European dynasties. The Puritan, as Saint-Gaudens has portrayed him, carries the Bible next his heart in one hand and a stout cudgel of oak in the other. He personifies those unswerving, and sometimes fanatic principles on which the ancient commonwealths of New England were established. The *Sherman* equestrian statue which was unveiled at the southeast entrance of Central Park in 1904 was the last of a series of five in which he commemorated heroes of the American Civil War, among the most notable of which is the remarkable statue of *Farragut* in Madison Square, New York City. Of the *Sherman* monument, executed by Saint-Gaudens, a critic had said: "The composition of the Sherman is his own, and it has the spontaneity and the balance of a work evolved straight from a powerful imagination and an original mind. The Victory is exactly where it belongs, and bears a relation as true, as unforced, as anything in nature itself to the horseman pressing close upon its flying robe. Once more a word on the sculptor's discretion is inevitable. He wanted to express movement in this monument, to give to Victory almost aerial lightness in her carriage, to embody in the horse a type of great strength, pushing its way to the front, and to make Sherman himself the very ideal of a leader, who spurns the miles behind him. The bronze seems almost sentient. The group quivers with vitality. But the rhythm of this dramatic conception is held so well in hand, it is so majestic, that classic art itself could not produce a more nobly monumental effect."

SAINT GEORGE, Cape, is the western projection of Newfoundland. It forms the northwestern extremity of Saint George Bay, on the Gulf of Saint Lawrence.

SAINT GEORGE AND THE DRAGON. See Dragon.

SAINT GEORGE'S CHANNEL, an arm of the Atlantic which separates Ireland from Wales. At the north it unites with the Irish Sea. Its entire length, from southwest to northeast, is about 100 miles.

SAINT GEORGE'S CHAPEL, Windsor, England. See Windsor.

SAINT-GERMAIN, săn-zhĕr-măn', **Comte de,** adventurer in Paris: d. Eckernfoerde, Schleswig, about 1784. Of disputed origin, he was thought to be an Alsatian Jew, a Portuguese, or the natural son of the queen of Charles II of Spain. He appeared at the French court about 1748, where he became a favorite of the marquise de Pompadour and of Louis XV. The latter employed him on various confidential missions. He claimed extraordinary powers of alchemy, and declared that he had lived 2,000 years. Arousing hostility in some quarters in Paris, he lived in London during 1760–1762, thence going to Saint Petersburg, Russia. He was again in Paris from 1770 to 1774, and then moved to Schleswig, there engaging in magical practices with the landgrave Karl of Hesse. Consult Lang, Andrew, *Historical Mysteries* (London 1904).

SAINT-GERMAIN, Treaty of, arising out of World War I, was signed on Sept. 10, 1919, between the Allies and Austria. It was the complement of the Treaty of Versailles, and settled at that period the territorial and political status of Austria. Its complete text was handed to the Austrian delegates on July 20, and it was ratified by the Austrian legislature on October 17.

It recognized Austria as a republic and fixed new boundaries for the state. Austria, on her part, recognized the full independence of all the territories which formed part of the former Russian Empire; and accepted definitely the annulment of the Brest-Litovsk Treaty, and of all treaties and agreements of all kinds concluded since the revolution of October 1917 with all governments or political groups on territory of the former Russian Empire. Austria further agreed to respect the political, racial, and religious rights of all peoples within her boundaries. The Austrian Army was limited to 30,000 men, including officers and depot troops; all Austrian warships had to be surrendered to the Allied powers, and no naval forces or air forces were allowed to be retained.

Other clauses provided for the restoration of jewels and paintings carried off by the house of Habsburg and other dynasties from Italy, Belgium, Poland, and Czechoslovakia; and her war debt was to be apportioned among the states as they existed after the dismemberment of the Austro-Hungarian Empire. Important conditions were drawn up affecting her ports, waterways, and railways.

SAINT GERMAIN-EN-LAYE, France, a town in the department of Seine-et-Oise, on a height bordering the Seine, 13 miles west of Paris. At the edge of a forest, 200 feet above the river, the air is bracing and salubrious. It is a favorite summer resort and

residence of Parisians. The terrace of St. Germain is one of the finest promenades in Europe and commands an extensive view of the valley of the Seine and surrounding hills. The ancient castle of the town now serves as a museum of antiquities; it was destroyed and restored at various epochs. This castle was first built by Charles V (1370), on the site of a still older structure, and reconstructed and embellished by many succeeding sovereigns, especially Louis XIV. Here were born Charles IX, Margaret of Navarre, Henry II and Louis XIV. James II of England and most of his family here lived and died as exiles. In the Henry IV pavilion Thiers died (1877). St. Germain is the seat of one of the cavalry garrisons which surround Paris. The treaty between the Allied and Associated Powers and Austria was signed here on Sept. 10, 1919.

SAINT GOTTHARD, sānt gŏt'ĕrd, Switzerland, a mountain group on the confines of the cantons Uri, Grisons, Ticino, and Valais, belonging to the Lepontine or Helvetian Alps, which it connects with the Bernese Alps. It forms a kind of central nucleus in the great watershed of Europe; each of its slopes giving rise to an important river—the north to the Reuss, the south to the Ticino, the west to the Rhone, and the east to the Rhine. All these rivers rise within a circuit of 10 miles from its center. The culminating point, Pizzo Rotondo, has a height of 10,490 feet, and three other summits are beyond the limit of perpetual snow. The Col of St. Gotthard, at its summit level, where the Hospice stands, is 6,808 feet high. A bridle path through the pass had existed since the 6th century and over it an excellent carriage road was completed in 1832, in which, particularly on the Italian side, formidable difficulties were surmounted, and much engineering skill displayed.

A railway tunnel pierces this mountain group between Göschenen on the north and Airolo on the south, thus directly connecting the railway system of North Italy with those of Switzerland and Western and Central Germany. This tunnel is 16,295 yards, or rather more than 9¼ miles long. Only two tunnels are longer. Its construction, begun in 1872, was completed in 1881, and it was opened for traffic early in 1882. The total cost of the railway and tunnel was about $57,800,000, of which $11,500,000 was expended on the tunnel alone, the expenses being met by Swiss, German, and Italian state subventions, by mortgages and shares. The excavation was carried on simultaneously from the Italian and the Swiss side, the workmen finally meeting in the middle, where the height above sea level is 3,785 feet.

SAINT GREGORY. See Gregory, Saint.

SAINT HELENA, sānt'l-ē'nà; sānt hĕ-lē'nà, city, California, in Napa County, in Napa River valley; altitude 299 feet; 68 miles north of San Francisco; on the Southern Pacific Railroad. St. Helena is in a fertile wine grape section, and has an important dry wine industry. The city is sometimes referred to as the "Table Wine Center of the World." Other crops are prunes, olives, figs, apricots, pears, peaches, and walnuts. Nearby, at Angwin, is Pacific Union College and the St. Helena Sanitorium (both Seventh Day Adventist). On the slopes of 4,343-foot Mount St. Helena is a petrified forest. Visitors are attracted by the vast stone vaults of the wineries, hollowed out of the solid limestone of the hills; and by the annual new-wine festivals, lavish California adaptations of an Old World custom.

St. Helena was once a part of the Carne Humana Rancho, a Mexican grant owned by Dr. Edward Bale, an Englishman, who built the Bale Mill in 1846. This mill is visited by thousands of tourists every year. Settlers came from Missouri in 1848, and the city was laid out by J. H. Still, another Englishman, in 1853. Its name comes from Mount St. Helena, which was named by early Russian settlers on the Coast. St. Helena was incorporated in 1876, and reincorporated in 1889. Pop. (1950) 2,297.

SAINT HELENA, island, in South Atlantic Ocean, a British insular possession, 1,200 miles west of Africa, and 700 miles southeast of Ascension Island, the nearest land; area about 47 square miles, of which some 8,600 acres are tillable.

St. Helena is of volcanic origin, the craters of long extinct volcanoes forming the main ridge of the island and other elevations, the highest of which is the 2,704-foot Diana's Peak. High cliffs extend around the shore to the water's edge; there are numerous caves and gorges, many of the latter 1,000 feet deep; an abundance of fresh water; and the largest tracts of level land, Deadwood and Longwood plains, in the northeastern section, are 1,700 feet above sea level. There is but one good harbor, St. James's Bay, which serves Jamestown, the only town on the island.

St. Helena's flora and fauna are interesting, many specimens being peculiar to the island; and the vegetation is largely tropical, though many English varieties have been naturalized, including the oak. Date palms, figs, fruit trees, bananas, eucalyptus, pine, cedar, bamboo and castor-oil plants thrive; potatoes and garden vegetables, cattle, sheep and poultry are raised for domestic use; and seafood and gamefowl are plentiful. Exports are chiefly flax products, tow, fiber, twine and rope. Other industries are lace making and fish curing.

St. Helena is a crown colony; and is garrisoned by a detachment of Royal Marines. There are cable connections with Capetown and the West Indies. Once an important port of call on the route to Capetown, the introduction of steam and opening of the Suez Canal changed its status, so that there is now an average of less than one vessel a week calling at the island. St. Helena was discovered in 1592 by the Portuguese, who later abandoned it; was occupied by the Dutch in 1651–1656; and by the British after 1656 except for a brief period in 1673 when it was claimed by the Dutch. Famous chiefly as the place of Napoleon's residence in exile from October 1815 until his death in May 1821, it has also been used as a place of detention for various African rulers; for Boer prisoners in 1899–1902; and World War I prisoners in 1914–1918. Ascension Island was annexed to it in 1922, and the Tristan da Cunha Islands in 1938. Pop. (1946) 4,748.

SAINT HELENS, sānt hĕl'ĕnz, county borough, England, Lancashire, 11 miles northeast of Liverpool, a municipal county and parliamentary borough, and market town. A town hall (1875–1876), a technical institute (1896), churches, schools, library and baths, an asylum and hospitals, numerous parks and recreation grounds are the main features. The town owes its importance to the coal-beds in the environs, copper-

smelting, the manufacture of iron and steel, chemical and lead works, potteries, breweries, its glass works and various other industries. Pop. (1951) 110,276.

SAINT HELENS, city, Oregon, on the Columbia River, altitude 30 feet above sea level, 30 miles from the city of Portland. It is served by the Spokane, Portland, and Seattle Railway and federal and state highways.

It is a manufacturing community with lumber, paper, and insulating-board mills. It is also a busy trading center for the vast agricultural hinterland of the Columbia River valley.

There are two grade schools, one high school, a public library, two banks, two newspapers, and numerous churches and civic organizations.

The first settlement was in 1844 but the area was not surveyed for a townsite until 1845. The city was incorporated in 1889. The government is the elected city council and mayor system. Pop. (1950) 4,711.

SAINT HELENS, a volcanic peak of the Cascade Range, in the State of Washington; height, 9,671 feet. The volcanic débris at the base and beyond is of ancient origin; the mountain has all the appearance of an extinct volcano. It resembles Mount Rainier in its treeless sides and ice-covered summit, but it is smaller. On the north side, at the base, is Spirit Lake.

SAINT HELIER, sânt hĕl'yĕr, town and civil parish, Channel Islands, island of Jersey, and a favorite European summer resort, on the east side of St. Aubin's Bay, on the south coast. It is strongly fortified and defended by Elizabeth Castle (1551–1586), on a rocky island connected with the mainland by a causeway, and by Fort Regent, an imposing citadel dominating the town. The principal buildings are Victoria College, the Maison St. Louis or Jesuit College, the courthouse, public library, town hall, hospital, Norman parish church and the French Roman Catholic cathedral. Fine markets, an esplanade and marine drive four miles long encircling the bay, and extensive and well-built harbors are prominent features. Pop. (1945) 19,398.

SAINT HENRI, city, Province of Quebec, Canada, a suburb of Montreal. It is a busy industrial center on the Lachine Canal and is served by the Canadian National Railway. Pop. (1951) 583.

SAINT-HILAIRE, săn-tē-lâr', **Auguste de** (in full Augustin François César Prouvençal de Saint-Hilaire), French naturalist and traveler: b. Orléans, Oct. 4, 1779; d. there, Sept. 30, 1853. A botanical expert, he set out in 1816 on a long journey through Brazil, carrying his explorations to regions then unknown, and returning in 1822 with valuable collections. In 1830 he was admitted to the Paris Academy of Sciences; subsequently he was made professor of botany in the Faculty of Sciences at Paris. He made several discoveries of scientific value, and published three narratives of travel, *Voyage dans les provinces de Rio de Janeiro et Minas Gerães* (1830); *Voyage dans le district des diamants et sur le littoral du Brésil* (1833); *Voyage aux sources de San Francisco et dans la province de Goyaz* (1847–1848); besides *Flora Brasiliae Meridionalis* and *Leçons de Botanique* (1840–1841).

SAINT-HILAIRE, Marco de (real name Emile Marc Hilaire), French writer: b. Versailles, about 1796; d. Dec. 5, 1887. He was educated as a page at the court of Napoleon I, and finding himself without means of support after the Restoration, turned his attention to literature. Though not important as a writer, his constant glorification of Napoleon was popular and undoubtedly did much to pave the way for the Second Empire. His work includes *Mémoires d'un page de la cour impériale* (1830); *Souvenirs de la vie privée de Napoléon* (1838); *Souvenirs intimes du temps de l'Empire,* 6 vols. (1838–1846); and *Histoire de Napoleon III* (1853).

SAINT HUBERT, Order of. See Orders and Decorations—*Germany* (Bavaria).

SAINT HYACINTHE, town, Quebec, Canada, in St. Hyacinthe County, on the Yamaska River, about 35 miles east of Montreal via the Canadian National (main line Montreal to Portland) and the Canadian Pacific railways. It is in a rich dairying and mixed farming district. The present-day city is chiefly noted for its industries the largest of which is a manufactory of cotton yarns. Other companies produce artificial silk, knitted goods and hosiery, and woollen yarns, and men's factory clothing.

The city was incorporated as a town over a hundred years ago. There is a Roman Catholic cathedral, a Dominican College, a seminary, a technical school, and two convents. Pop. (1951) 19,999.

SAINT IGNATIUS COLLEGE, now **LOYOLA UNIVERSITY.** See Loyola University.

SAINT IVES, sânt īvz', municipal borough, England, in Cornwall on St. Ives Bay, 60 miles southwest of Plymouth. The parish church of St. Andrew is in the Early Perpendicular style of the 15th century. It is a fishing town and popular watering place. Pop. (1951) 9,037.

SAINT IVES, municipal borough, England, in Huntingdonshire, on the Ouse River, about 50 miles north of London. It is the seat of an annual fair and market which was granted by Henry I to the abbot of Ramsey in 1286. This fair, originally held for eight days at Easter time, was gradually extended for a few days, and still survives. An old bridge, built by the abbots in the 15th century, crosses the river here. The central part of the bridge was used as a chapel. Oliver Cromwell was said to have resided here for one year, 1634–1635. The town, incorporated in 1874, has a large agricultural trade. Pop. (1951) 3,077.

SAINT JAMES, city, Minnesota, county seat of Watonwan County, on St. James Lake, 33 miles west-southwest of Mankato and 120 miles southwest of Minneapolis and St. Paul. It is served by the Chicago, St. Paul, Minneapolis and Ohio, and the Minneapolis and St. Paul railroads. It is an important agricultural area. Settled in 1868, it was incorporated in 1900. The form of government is city council. Pop. (1950) 3,861.

SAINT JAMES'S COFFEE-HOUSE, a famous Whig coffee-house of London which flourished from the time of Queen Anne until

late in the reign of George III. It stood on Saint James' street in the neighborhood of Saint James' Palace, and was much frequented by Swift, Harley and other men of note in its early days. It was here that Goldsmith's poem *Retaliation* originated.

SAINT JAMES'S PALACE, London, England, a royal palace located on the Mall, between St. James's and Green parks. It was originally the site of a hospital built about the time of the Norman Conquest, but Henry VIII took possession of it in exchange for land in Suffolk. During 1532–1533 he had it rebuilt as a palace. Edward VI, Elizabeth, and Mary I lived here; it was the birthplace of Charles II, James II, Mary II, Anne, and George IV. Queen Mary I died here in 1558, and in 1649, Charles I spent his last night here. Queen Caroline, wife of George II, died here. George III acquired Buckingham Palace and often lived there. The palace is also remembered as the scene of many famous weddings: George III to Charlotte; George IV to Caroline of Brunswick; Queen Victoria to Prince Albert; Edward VII to Princess Alexandra; and George V to Princess Victoria Mary of Teck. Sir Christopher Wren was married here to his second wife, Jane Fitzwilliam, in 1676. Fire destroyed the east wing of the palace in 1809. Buckingham Palace became the royal home with the accession of Queen Victoria. It was considerably damaged by bombings and fires during World War II, and several rooms were destroyed.

SAINT JEAN D'ACRE, săn zhŏn däkr, Palestine. See ACRE.

SAINT-JEROME, Canada, city and county seat of Terrebonne County, Quebec, 29 miles north of Montreal, on the North River, and on the Canadian Pacific and the Canadian National railways. It is the seat of a commercial college, a normal school, and a convent. Its industries include rubber mills, knitting mills, foundries, paper mills, cement pipes, pulp, and sash and door and saw mills. Pop. 12,000.

SAINT JEROME DE MATANE, or MATANE. See MATANE.

SAINT JOHN, one of the 12 apostles of Jesus Christ. He and his brother James are often spoken of as sons of Zebedee. It is commonly accepted (cf. Mark xv, 40 and Matt. xxvii, 56) that his mother's name was Salome and it is still further conjectured by many (see John xix, 25) that she was a sister of Mary, the mother of Jesus — a relation which would render more natural the committing by Jesus of his mother to the care of John. The family seems to have possessed some means, as Zebedee employed hired servants in his fishing business; Salome is mentioned among the pious women who aided in the support of Jesus and his associates during his ministry and John himself was personally known to the high priest.

Of his early life we know nothing. Presumably he had the ordinary training of the Jewish boy of his time and no more. In the order of narration, he first appears, according to an obvious inference, as an unnamed disciple of John the Baptist, who with Andrew follows Jesus (John i, 35–39). After some association with Jesus, John returned to his occupation as a fisherman, from which Jesus summoned him and his brother, together with Simon and Andrew, to discipleship, which was the basis of his appointment as one of the 12 apostles. In this company he was one of the three who were admitted to the closest intimacy with their Master and, indeed, is generally understood to be "the disciple whom Jesus loved." Little in particular is noted, however, in reference to him while Jesus lived. He and his brother are said to have been called "Boanerges," defined as "Sons of Thunder" (Mark iii, 17). While the meaning is somewhat obscure, it seems most probable that this hints at great stores of emotional power and passion. He, with his brother, is rebuked for proposing to summon fire from heaven to destroy the inhospitable Samaritan village, and he alone confesses attempting to check the activity of a healer who was not of their company. Only he of the apostolic company is mentioned as present at the trial of his Master and at his crucifixion, where he received the commission to care for Mary, the mother of Jesus, which he faithfully carried out, making a home for her till her death.

It appears from the statements in Acts and of Paul in his Epistle to the Galatians that for some time John remained in Jerusalem. Beyond this we are dependent upon tradition, which consistently associated the latest years of his life with the city of Ephesus. To be sure, on the basis of uncertain inferences from an obscure passage possibly incorrectly quoted by Eusebius from Papias, it has been argued by many scholars that all the tradition that John was at Ephesus was due to the confusion of the apostle with a supposed presbyter and original disciple of Jesus bearing the same name. But all the positive evidence tends toward the association of John in his latest years with Ephesus. There is a fragmentary tradition that he went to Rome and was there plunged into a cauldron of boiling oil, from which he miraculously escaped unharmed, and that he was then banished to an island. John, the author of the Apocalypse, speaks of himself as being "in the isle that is called Patmos," and the date which is given by Irenæus and others for the exile of John the apostle is late in the reign of Domitian, and for his return the year 96, early in the reign of Nerva. There is no tradition as to the date of his death. Many legends are current as to his life at Ephesus. Irenæus tells of his hostility to the tenets of the Gnostic Cerinthus, such that John even refused to remain under the same roof with the heretic. Clement of Alexandria exalts his pastoral fidelity by a story how he journeyed into the forest to reclaim a young man who had fallen into evil ways and joined a band of robbers. Cassian relates that when he was censured for spending time in play with a tame partridge, he answered that the bow cannot always be bent. The story, however, which is most familiar, is due to Jerome, who tells that, when so aged that he must be carried into church and was unable to speak at any length John would continually repeat, "Little children, love one another." Perhaps partly based on this story, partly perhaps on an impression gained from a superficial reading of his letters, the notion has widely prevailed that John was a weak sentimentalist. But this is unjust. It has been profoundly said of his epistles that their words are thunderpeals and it is plain that in his soul burned the fires of passion and

power which made him in his youth one of the «Sons of Thunder,» although in his age he had learned repression and self-mastery.

W., 'The Fourth Gospel in Research and Debate' (1910); Chapman, John, 'John the Presbyter and the Fourth Gospel' (1910); Drummond, James, 'An Inquiry into the Character and Authorship of the Fourth Gospel' (1903); Moffatt, James, 'An Introduction to the Literature of the New Testament' (1911); Thomas, W. H. G., 'The Apostle John' (1923).

DAVID FOSTER ESTES,
Former Professor of New Testament Interpretation, Colgate University.

ST. JOHN, Charles Edward, American physicist: b. Allen, Mich., 15 March 1857. He was graduated at the Michigan Normal College in 1876 and studied physics at Harvard and at the University of Berlin. He became instructor of physics at Michigan Normal College in 1885; was made associate professor at Oberlin College in 1897 and in 1899 became professor of physics and astronomy at that institution. In 1907 he was appointed dean of the College of Arts and Sciences there. From 1908 he has been astronomer at the Mount Wilson Solar Observatory of Carnegie Institution. He is a member of various national astronomical societies. He has written 'Wave-Lengths of Electricity on Iron Wires' (1894); 'A Study of Silphium Perfoliatum and Dipsacus Laciniatus in Regard to Insects' (1887).

ST. JOHN, Frederick Edward Molyneux, Canadian journalist and author: b. Newcastle, England, 28 Nov. 1838. His father was one of Wellington's veterans at the battle of Waterloo and the son followed him in a military career, on 23 April 1855 entering the Royal Marines (Light Infantry) as second lieutenant. He served under General Van Straubenzie throughout the operations against Canton in 1857–58 and acted with such gallantry under fire during the storming of the fort that in August 1858 he was promoted first lieutenant. In 1868 he came to Canada and being a member of the staff of the Toronto *Globe* was appointed in 1870 to accompany Colonel Wolseley's Red River expedition and later served with Lord Dufferin on his tour of British Columbia. Upon the forming of the Northwest Territories, he became the first clerk of the legislature, the first secretary of the Protestant board of education and later was appointed sheriff and Indian commissioner. In 1879 he returned to England, where in 1884 he became the first emigration agent and London secretary to the Canadian Pacific Railway. He was at different times editor of the Winnipeg *Standard*, the Montreal *Herald* and the Manitoba *Free Press* and in 1888 was president of the Ottawa Press Gallery. He has published 'A Sea of Mountains,' an account of Lord Dufferin's tour (1877); and 'Under the Mistletoe,' a society play. Deceased.

ST. JOHN, Henry. See BOLINGBROKE, VISCOUNT.

ST. JOHN, James Augustus, English author and traveler: b. Carmarthenshire, Wales, 24 Sept. 1801; d. London, 22 Sept. 1875. At 16 he went to London and engaged in newspaper work and in 1827 started the *Weekly Review*. He lived much of his life abroad, in France Switzerland, Egypt and elsewhere and found material in his travels for many of his works. He contributed to 'Constable's Miscellany' in 1830 a 'Journal of a Residence in Normandy' and wrote 'Egypt and Mohammed Ali' (1834); 'Anatomy of Society' (1831); 'Manners and Customs of Ancient Greece' (1842); 'Egypt and Nubia' (1845); 'Views in the Eastern Archipelago' (1847); 'Isis, an Egyptian Pilgrimage' (1853); 'Philosophy at the Foot of the Cross' (1854); 'Nemesis of Power' (1854); 'Preaching of Christ' (1856). He also wrote 'Lives of Celebrated Travelers' (1831); a biography of 'Louis Napoleon' (1857); an elaborate 'Life of Sir Walter Raleigh' (1868–69), etc.

ST. JOHN, John Pierce, American governor and prohibitionist: b. Brookville, Ind., 25 Feb. 1833; d. Olathe, Kan., 31 Aug. 1916. He went to California in 1853; later traveled in Mexico, Central and South America and Hawaii; and fought in Indian wars in Oregon. He served in the Union Army in 1862–65, attaining rank of lieutenant-colonel and subsequently removed to Missouri, where he engaged in law practice. In 1869 he settled at Olathe, Kan., and in 1879–83 he was governor of Kansas. He was Prohibition candidate for President in 1884, but in the first Bryan campaign affiliated himself with the Democratic party. He toured Kansas for woman suffrage in 1912 and in 1914 went on a speech-making tour of the East in behalf of prohibition.

ST. JOHN, Sir Spencer, English diplomat, son of J. A. St. John (q.v.): b. London, 22 Dec. 1825; d. Camberley, Surrey, 2 Jan. 1910. In 1848 he was appointed secretary to Sir James Brooke in Borneo, in 1850 became secretary to the mission to Siam and during 1856–61 was consul-general in Borneo. During the years 1863–96 he was consul successsively in Haiti, Lima, Bolivia, Mexico and Stockholm. He was created K. C. M. G. in 1881. He has published 'Life in the Forests of the Far East' (1862); 'Life of Sir James Brooke, Rajah of Sarawak' (1878); 'Haiti, or the Black Republic' (1885); 'Rajah Brooke, (1899); 'Adventures of a Naval Officer' (1905); 'Earlier Adventures' (1906); 'Essays on Shakespeare and his Works' (1908).

SAINT JOHN, one of the Virgin Islands, formerly Danish West Indies, lying east of Saint Thomas (q.v.), area, 19 square miles. It is of volcanic origin and hilly; only a small portion of the land is cultivated; sugar is the chief agricultural product. Cattle are raised and exported and bay rum is also exported. Coral Bay, on the east coast, is one of the best sheltered and safest harbors of refuge during hurricanes in the Antilles. By the terms of a treaty with the United States, ratified by the Danish parliament 22 Dec. 1916, the entire Danish West Indies, for and in consideration of the sum of $10,000,000, passed into the possession of the United States and are now administered by it. Pop. (1940) 722. See WEST INDIA and VIRGIN ISLANDS.

SAINT JOHN, British West Indies, the capital of Antigua, situated on the northwest coast, stands at the head of a safe but small bay. The residence of the English governor-

in-chief is the principal building. The staple of the island is sugar, which, together with pineapples, forms the chief export trade.

SAINT JOHN, city, Province of New Brunswick, Canada, St. John County seat; situated at the mouth of the St. John River on the Bay of Fundy; terminal of both the Canadian National and Canadian Pacific railways; by rail 482 miles from Montreal, 279 miles from Halifax. The city has a municipal airport with airline service, and is one of the great winter ports of Canada's Atlantic seaboard, administered by the National Harbours Board, and linked with every continent by steamship services.

Economic Activity.—St. John has nearly three miles of modern concrete piers, a score of metal transit sheds, three grain elevators with a storage capacity of 3,500,000 bushels, new customs and immigration facilities, and a drydock that could easily hold any ocean liner; a graving dock 1,150 feet long, 125 feet wide, and 42 feet draft over sill; and a tidal dock 440 feet long, 60 feet wide. The drydock and shipping are St. John's largest industries. Others include lumbering, woodworking, sugar refining, brass foundry, brushes, commercial fishing, clay bricks and building tiles, roofing, nails, cardboard and corrugated boxes, textiles, molasses, and lime.

Education.—Educational and cultural interests are strongly represented, including a symphony orchestra, art association with representative Canadian artists, music, and drama groups. A large provincial Festival of Music is held in St. John each spring.

Buildings and Places of Public Interest.—Besides modern public schools, a provincial vocational school, New Brunswick Museum, and Public Library, there are 67 churches (one erected in 1824), and four hospitals (including one provincial and one dominion institution). About a mile from the center of St. John are the Reversing Falls rapids seen where the St. John River meets the sea at the head of St. John harbor. At low tide the river water rushes through a 325 foot gorge with banks 95 feet high and makes a 17 foot descent to the sea. Then for a few minutes at slack tide, half way between high and low tide, the seething cauldron is quiet as a mill pond, and ships may pass through the gorge. Later, with the rising tide, the ocean waters force themselves upstream through the chasm in a turmoil of boiling eddies, whirlpools and rapids. This struggle takes place twice in every 24 hours.

History.—The river owes its name to Samuel de Champlain and Sieur de Monts, who first visited the harbor on the day of St. John Baptiste, June 24, 1604. For some years following Father Edmond Mosse, a Jesuit, was reported living among the Indian savages but it was not until 1631 that Ft. La Tour was built at St. John, only to be destroyed by Sieur D'Aulnay de Charnisay who established himself in another fort on the opposite side of the harbor. Ft. Charnisay was occupied by garrisons from time to time until 1700 when it was allowed to fall into ruin for about half a century. About the year 1758, however, it was captured by the English, rebuilt, and named Ft. Frederick. In 1762 the first English settlement developed under James Simonds, William Hazen and James White whose interests lay in fisheries, fur, ships, lumbering and lime. Finally the modern city developed in 1783 with the arrival of the United Empire Loyalists. This wave of colonization made New Brunswick a province in 1784, and a Royal Charter effective May 18, 1785, incorporated the former settlements of Parrtown and Carleton as the city of St. John, the first incorporated city in British America. St. John was also the first city in Canada to adopt the commission form of government. In 1877 a disastrous fire destroyed over half the city and many of the old wooden buildings were replaced with brick. Pop. (1951) 78,337.

PATRICIA W. HART,
Chief Librarian.

SAINT JOHN, river, the largest river of the province of New Brunswick, Canada, has its source in the highlands of northern Maine. After a course of 390 miles, it empties into the Bay of Fundy through a rocky gorge 325 feet wide, having a total fall of 17 feet. Throughout most of its upper course it forms the boundary between Maine and Canada. It is navigable for steamers of considerable size as far as Fredericton, a distance of 86 miles, while small steamers ascend to Woodstock, 145 miles.

SAINT JOHN, Knights Hospitallers of. See JOHN, ORDER OF SAINT.

SAINT JOHN, Lake (French LAC SAINT-JEAN), Province of Quebec, in St. John County, Canada, 200 miles by rail north of Quebec, a circular body of water, about 28 miles long and 25 miles broad, drained by the Saguenay River (q.v.). It receives the waters of the Mistassini, the Peribonka, the Ashuapmuchuan, and several smaller streams. It is exceedingly popular for its fishing.

SAINT JOHNS, city, Michigan, and Clinton County seat; altitude 765 feet; 98 miles northwest of Detroit; on the Grand Trunk Railway; federal highways; and with motorbus and truckline service. Situated in a rolling, well watered district, it has varied farming interests, including livestock, beans, peppermint and hatcheries; while among its manufactures are farm implement parts, piston rings, spray guns, and foundry products. There is a public library, and the village has a mayor, council and city manager. There are three elementary schools and one public high school. The water works are municipally owned. Pop. (1940) 4,422; (1950) 4,948.

SAINT JOHN'S, city, capital of the Province of Newfoundland, Canada, situated in the southeast corner of the island, in latitude 47° 34′ 02″ N, and longitude 52° 40′ 59″ W. It lies across the chief Atlantic shipping lanes and is 1,213 miles from New York and 1,829 miles from Liverpool. The harbor is completely landlocked and is entered by a short passage between high cliffs known as the "Narrows." The town was originally situated on the north side of the harbor but in recent years has spread north and west. It was a convenient port for fishing craft from European nations in the 16th century and today is a key defense port of the North Atlantic.

Communications.—St. John's is the eastern terminus of the Newfoundland Railway which on confederation in 1949 became part of the Canadian National Railway system. The western terminus at Port-aux-Basques is connected by boat with the mainland of Canada. Steamship lines also connect the city with Liverpool, New York, Bos-

ton, Halifax and Montreal. St. John's is also on the international air routes being only 45 minutes flying time from the Gander Airport. Its airport, Torbay, is four miles from the city. The city is connected by cable and telegraph lines and by radio telephone with the mainland of North America and the continent of Europe. It will be the eastern terminus of the Trans-Canada Highway, when completed. Communication is maintained with all parts of the province by means of telegraph, telephone and radio telephone. Steamships of the Newfoundland Railway ply between the capital and the chief ports along the coast. Transportation within the city is by bus and taxi and bus lines connect it with nearby towns and villages.

Business Center.—St. John's is the chief center of the business and financial interests of the island. In recent years, however, it has lost some of its importance in this respect. This is due to the development of the paper industry and the consequent rise to importance of the paper towns of Grand Falls in the north and Corner Brook in the west and also to the partial decentralization of the fishing business. Nevertheless it still retains much of its character as a center of the shipping and commercial interests and is still the chief center of the fishing business including the seal fishery. It also serves as a distributing center for the greater part of the island with the exception of the west coast. There are five banks: Bank of Montreal, Bank of Nova Scotia, the Royal Bank of Canada, the Bank of Commerce and the Newfoundland Savings Bank. Most of the principal business houses are located here. It has a large dry dock.

Manufactures.—There are several important factories, one of the largest being a ropewalk. There are biscuit factories, a margarine factory, breweries, lumber factories, foundries, a paint factory and a tobacco factory. There are two large fish refrigeration plants. Seal and cod oil are manufactured and seal skins exported.

Public Works, Buildings.—The city has an excellent water service, the water being obtained from a natural lake a few miles distant. Hydroelectric power is furnished by plants a few miles from the city. The city is the headquarters for the health services of the province and has three large hospitals, a mental hospital and a sanatorium for tubercular patients. It has two cathedrals, the one, Roman Catholic, an imposing example of modified Romanesque architecture, and the other, Anglican, a beautiful example of Gothic, designed by the late Sir George Gilbert Scott, R.A. There are also a number of fine churches of the various religious denominations. The city possesses a number of excellent schools and colleges and also a public library. There is now a university—the Memorial University—formerly known as the Memorial University College. It was built as a memorial to the Newfoundlanders who fell in the war of 1914–1918, and was given the status of a university in 1950. There is also a fine monument erected to commemorate the fallen in the same war. Other public buildings are the Colonial Building where the legislature meets, Government House and the Court House. The city has three radio stations and is the regional headquarters for the Canadian Broadcasting Corporation. It has three parks—Bannerman, Victoria, and Bowring. The latter is situated about two miles from the city and is noted for its beautiful natural scenery.

History.—Because of its position in the center of the cod-fishing grounds, St. John's became the headquarters of the fishing industry from the date of the discovery of Newfoundland in 1497. The date of its foundation cannot be exactly determined. Its first inhabitants were evidently part of the crews of the fishing fleet, who were left behind during the winter to prepare for the next season's fishery. There were 20 houses in St. John's in 1540. Hayes, a member of Gilbert's expedition in 1583, speaks of the town as a "place very populous and much frequented." A large barter trade, one of the most important in Tudor times, was carried on here between the French, Portuguese, Basques and the English fishermen. The American colonies began trading with Newfoundland as early as 1641 and by the time of the revolution St. John's did a business of $4,000,000 with them.

The town was twice captured and destroyed by the French and their Indian allies. On the last occasion it was retaken by Col. William Amherst with the Highlanders and the Royal American Regiment, the last and most gallant fight of the Seven Years' War.

St. John's was built of wood and has been three times practically destroyed by fire, in 1817, 1846, and 1892. It has been greatly improved in recent years and most of the buildings are now of brick, stone and concrete.

It has been the scene of a number of historic events. It was here that Sir Humphrey Gilbert took possession of the island in 1583. In 1901 Signor Guglielmo Marconi received here the first wireless signal to be sent across the Atlantic. In 1939 King George VI and Queen Elizabeth visited it. In 1919 Alcock and Brown took off from here on the first successful trans-Atlantic flight. The American base, Fort Pepperell was established near the city in 1941.

Government and Population.—The city is governed by a mayor and a council of six members. Pop. (1951) 67,749.

SAINT JOHNS, a river in Florida, the source of which lies in the unsurveyed swamps about Lakes Helen Blazes and Saw Grass in Brevard County. It flows north nearly parallel to the seacoast through numerous marshes, ponds, and lakes to Jacksonville where it turns eastward to enter the Atlantic Ocean about 15 miles from the city. Luxuriant vegetation, and in places large trees, line its banks for the greater part of its course. It is navigable for ocean steamers to Jacksonville, and for small steamers as far as Sanford, about 200 miles from the sea. In its lower (northern) reaches it is six or seven miles wide, and it is a mile wide 150 miles from its mouth. It forms part of the Intracoastal Waterway from Palatka, 86 miles upstream to the Atlantic Ocean. It receives many streams notably the Oklawaha. See FLORIDA—*Physical Characteristics.*

SAINT JOHN'S BREAD. See CAROB.

SAINT JOHN'S COLLEGE, Cambridge, England, was founded by Margaret, countess of Richmond and Derby, mother of King Henry VII, in 1511 mainly through the exertions of Fisher, bishop of Rochester, then chancellor of the university, who raised sufficient funds to endow 32 fellowships. The college replaced Saint John's Hospital founded in

the 12th century, and now consists of a master, at least 56 fellows, 60 foundation scholars and nine sizars; both fellowships and scholarships being open to all British subjects. Five fellowships are professorial fellowships to be held by professors of the university. There are three divinity studentships of the value of about $400, tenable for three years, and open to the competition of bachelors of arts not of sufficient standing to take the degree of M.A.; also four law studentships of the value of $450, tenable for four years; and a Hebrew scholarship of the value of $160, tenable for three years. Some $33,500 are expended annually in assisting deserving students of the college, and there are a number of prizes which are awarded on the results of the annual examinations. The college has the patronage of 52 church livings. The buildings include four courts chiefly of brick; the new court (1826) across the Cam, built of stone, is united by an ornamental covered bridge, commonly called the «bridge of sighs,» with the third court. The chapel (1869) is by Sir Gilbert Scott, and is a fine specimen of the Early Decorated style. The combination-room, 93 feet long, and the library (1623) are curious and striking. Ascham, Ben Jonson, Bentley, Rowland Hill, Wilberforce, Wordsworth and Lord Palmerston were members of the college.

SAINT JOHN'S COLLEGE, Oxford, England, a college founded in 1555 by Sir Thomas White, a London alderman, for a president, 50 fellows and scholars, a chaplain, an organist, six singing men, eight choristers and two sextons. Some of the buildings belong to the earlier college or Saint Bernard dating from about the middle of the 15th century. With buildings added at subsequent dates the whole forms a picturesque group. Under the statutes made by the Oxford Commissioners in 1926 the foundation consists of (1) an unlimited number of fellowships comprising the official fellows, professorial, emeritus, and supernumerary fellows, and senior and junior research fellows; (2) not more than 46 entrance scholars, of which 15 are for the Merchant Tailors' School, two to Coventry School, two to Bristol School, two to Reading School, one to Tunbridge School, and the remainder, not exceeding 24, open scholarships; (3) three senior scholarships confined to former pupils of Merchant Tailors' School. There are also two Fereday fellowships of £200 each annually; four Casberd scholarships of £100 annually; and certain exhibitions for undergraduates not on any foundation, and of at least one year's standing in the college. The Fereday fellowships founded by Dudley Fereday of Ettingshall Park, Stafford, are open, with certain limitations in respect to literary proficiency, first to the kindred of the founder, secondly to natives of Staffordshire, and then to any person whatsoever. There are some 33 church livings within the patronage of the college. Saint John's College, like all the other colleges at Oxford, is an individual corporation forming part of the general corporate body of the University.

SAINT JOHN'S COLLEGE, located at Annapolis, Md., was founded in 1696 as King William's School, rechartered under its present name in 1784. William Paca, Maryland signer of the Declaration of Independence, was among the petitioners for the charter. Three other signers, Charles Carroll of Carrollton, Samuel Chase, and Thomas Stone, were members of the College's Board of Visitors and Governors. Among its graduates was Francis Scott Key. The College is for men only and is non-sectarian. In 1937 St. John's drastically revised its curriculum; abolished the elective system in favor of a four-year all-required curriculum; abolished text-books for the study of some hundred-odd of the world's greatest books from Homer to living authors. This curriculum, which gained national fame as «the St. John's Program,» involved for every student four years of seminar discussions of the great books, of language study, of mathematics, of laboratory science. In 1938 the College abolished intercollegiate athletics and substituted a greatly expanded system of intra-mural sports. Approximate annual enrolment: 150.

SAINT JOHN'S EVE. See JOHN'S, EVE OF SAINT.

SAINT JOHN'S UNIVERSITY, Brooklyn, N. Y., founded as Saint John's College in 1870, chartered in 1871, re-chartered by the Regents of the University of the State of New York in 1906, and granted full university privileges with power to establish all necessary professional schools. It comprises a school of arts and sciences offering courses leading to the degrees of Bachelor of Art and Bachelor of Science; a graduate school offering courses leading to the degrees of Master of Art and Master of Science; a school of law; a school of pharmacy, and a school of commerce. It also operates a summer school. The school of arts and sciences is for men only: the graduate school and the various professional schools are open to both men and women. The university is under the control of the Roman Catholic Church. In 1935–36 there were 6,800 students enrolled.

SAINT JOHN'S UNIVERSITY, Collegeville, Minn., founded in 1857 and chartered the same year, is a Roman Catholic institution in charge of the Order of Saint Benedict. In 1869 the school was granted power to give degrees; and in 1878 it was further empowered by Leo XIII to grant the degrees of doctors in theology, philosophy and canon law. In 1883 it received from the legislature of Minnesota the title of University. The institution comprises the College Preparatory; the Liberal Arts College; the Seminary, also called School of Theology; and the School of Architecture. The university conducts week-end seminars in sociology in connection with the State organization of the Central Verein of Minnesota.

SAINT JOHN'S UNIVERSITY, Toledo, Ohio, under the direction of the Fathers of the Society of Jesus was opened in September 1898 and as «The Saint John's College of Toledo, Ohio,» was incorporated 22 May 1900. On 29 Aug. 1903 with the corporate title changed to «The Saint John's University of Toledo, Ohio,» the power to grant degrees under an amended charter, was ratified by the Secretary of State. Well equipped buildings and grounds offer all possible facilities for higher education. An undergraduate department consisted of a four years' course in the study of English composition and literature, Latin and Greek, German, French, history, algebra and the regulation courses of a Jesuit institution. The

university consisted of three distinct departments: St. John's College for Men; Mary Manse College for Women; and Teachers' College. There was for a time a law department, and there was no graduate school strictly speaking, though special students might enroll for the master's degree. The regular degrees offered were the B.A., the B.S., and the Ph.B. A two-year premedical course was given. The annual approximate enrollment in all departments was about 500. The institution is now closed.

SAINT JOHN'S WORT, a large genus (*Hypericum*) of plants of the family Hypericaceae. They are to be found nearly everywhere in the temperate and torrid zones, and are often shrubs or small trees. The foliage is pellucid punctate or black-dotted and the leaves and blossoms emit, when bruised, a strong resinous-aromatic odor, and have a bitter taste, due to an oil possessing astringent and tonic properties, and which held a prominent place in old pharmacopoeias. The flowers are perfect and numerous, borne solitary or in cymose panicles and are generally yellow.

Hypericum perforatum, to which formerly the name of St. John's wort was limited, has its leaves marked with pellucid dots, somewhat simulating perforations. It is a European plant which has become naturalized in America, and is a troublesome weed. It is a very smooth, shining herb, sometimes two feet high, with opposite oblong leaves and bright yellow flowers in broad terminal cymes. Both petals and leaves are black-dotted. Its yellow, acrid, resinous juice will stain the skin purple and was believed by Dr. John Torrey to cause inflammatory trouble in cattle. The dried plant dyed wool yellow.

Tradition states that the St. John's wort was so called because bloodlike spots appeared on its foliage immediately after the saint was beheaded and reappeared on the anniversary of the date. It was regarded as a universal panacea and perhaps possessed some curative qualities, especially in external use. It was supposed to preserve persons and property against lightning, but was still more in demand as a preventive of witch visits or those of other evil spirits, perhaps because, according to tradition, a baptized person anointing the eyes with the green juice of its inner bark could see witches. Italians gave it the name of devil-chaser. It was not only worn as an amulet, but was hung over doors and windows; yet it was not safe to tread on it after dark, since the luckless wight that bruised it might be snatched up on a fairy horse and carried about all night. St. John's wort, plucked on midsummer night's eve, took its place among the love charms.

SAINT JOHNSBURY, village, Vermont, and Caledonia County seat, situated at an altitude of 655 feet between the Green and the White Mountains at the confluence of the Passumpsic, the Moose and the Sleeper's rivers. This largest town in northeastern Vermont, 30 miles east of Barre, is served by the Canadian Pacific, the Maine Central, and the St. Johnsbury and Lake Champlain railroads and by the Vermont Transit Company busses and Greenwood Bus Lines. It has a municipal airport.

The territory was first granted by King George in 1770 under the name of Bessborough and later, Dunmore; the first settlement was in 1786, when Jonathan Arnold and associates of Rhode Island received a charter from Vermont's first governor, Thomas Chittenden. The community, still the only one in the world of its name, was named in honor of Michel Guillaume Jean de Crèvecoeur (pseud. J. Hector St. John), French consul at New York, friend of Ethan Allen and author of *Letters from an American Farmer.* In 1792, St. Johnsbury and other towns were set off from Orange County to form the new county of Caledonia. In 1856, the county seat was transferred from Danville to St. Johnsbury. In 1830 Thaddeus Fairbanks, seeking a method of weighing entire loads of hemp, invented and patented scales for this purpose.

The village is the business, industrial, shipping and cultural center of an agricultural section; claims the largest maple sugar industry in the world and, in addition, besides manufacturing scales, produces stock feeds, tool handles, dresses, gloves, chairs, bowling and billiard supplies, optical lenses and other articles. Located here is the St. Johnsbury Academy (founded in 1842 by Thaddeus Fairbanks and his brothers); the St. Johnsbury Trade School; and the Convent of the Congregation of Notre Dame. The vocational school is closely related to the scales works. There is a museum of natural science, and the Athenaeum is a well-stocked library and museum. The government is of the city manager type. Pop. (1940) 7,437; (1950) 9,281.

SAINT JOHNSVILLE, village, New York, in Montgomery County; altitude 360 feet; on the Mohawk River and the New York State Barge Canal; 64 miles northwest of Albany; on the New York Central Railroad. Its products are dresses, underwear, gloves, and shoes. It became a town in 1798, a village in 1875, and has mayor and council government. Pop. (1940) 2,283; (1950) 2,210.

SAINT JOSEPH, city, Michigan, and Berrien County seat; altitude 595 feet; on Lake Michigan, at the mouth of the Saint Joseph River; 96 miles east of Chicago; on the New York Central; Chicago, South Shore and South Bend (electric); and the Chesapeake and Ohio railroads. St. Joseph is closely related, commercially, with Benton Harbor, two miles to the north, especially in connection with lake shipping business. St. Joseph is situated on a hill west of the river and has varied industrial activities; its factories, shops, and foundries make hosiery, paper boxes, rubber goods, washing machines and ironers, and malleable metal products. Inland from the city lies the Michigan fruit belt. There are mineral springs nearby. The modern public and parochial schools and city library constitute St. Joseph's educational facilities.

An old lighthouse is a point of interest; and the accepted site of old Fort Miami, built about 1700, is marked. A French flag flew here until 1763 when Chief Pontiac pulled it down and destroyed the post. Permanent settlement was effected in 1829; incorporated as a village in 1836, and as a city in 1892. The city government is administered by commissioners and a city manager. Pop. (1940) 8,963; (1950) 10,223.

SAINT JOSEPH, city, Missouri, and county seat of Buchanan County, on the Missouri River, the third city in size and wealth in Missouri, is a major trading center for 15 counties in northwest Missouri, southwestern Iowa, southeastern

Nebraska and northeastern Kansas. The city extending for three miles along the river front stands on high rolling ground, entirely free from floods or overflow and covers an area of 14.07 miles. A modern steel free bridge permits traffic flow into the state of Kansas, Elwood, Kansas, being the port of entry. With its sightly hills, winding avenues, parks, and beautiful boulevard system, St. Joseph is a picturesque city, healthful and a desirable place of residence.

The railroads serving St. Joseph are the Santa Fe, Burlington, Rock Island, Chicago Great Western, Missouri Pacific, and Grand Island Railroad (Union Pacific System). Through their immediate connections St. Joseph is served by railroads to all points in the northwest, southwest and central west. The city has a 500-acre modern municipal airport. It has 1,350 acres of parks and parkways of natural beauty, numerous tennis courts, two municipal swimming pools, three private and one municipal golf courses. It is an important commercial center and its principal industries consist of meat packing, milling, cereal manufacturing, textiles and it is the home of the largest tablet and stationery manufacturing plant in the world; and has many beverage manufacturing companies.

Predominating Industries.—The leading industrial and commercial activities of St. Joseph are manufacturing, merchandise distribution and livestock and grain marketing. The principal manufactures are packinghouse products, milling and cereal products, clothing and other textiles, candy, dairy products, harness and saddlery, foundry and machine-shop products.

Stock Yards.—A great impetus was given the growth and prosperity of the city by the improvements and extensions made at the stock yards, which were begun in the year 1897. The stock yards proper consist of approximately 500 acres of land, 80 acres of which are covered by pens and sheds. Swift & Company together with Armour & Company comprise the principal packers in the southern portion of the city, there being several smaller plants which kill and pack in other portions of the city. This industry has undergone extensive development in the past decade.

Public Buildings.—Chief of these are the Federal Court and Post Office building. Other buildings of importance are the County Courthouse, Union Railway Station, the Auditorium, Livestock Exchange, Corby Building, Chamber of Commerce Building which houses the Chamber of Commerce and the St. Joseph Forward Association which is an organization created by the leading businessmen of St. Joseph for the industrial development of St. Joseph and its environs. This association is a nonprofit organization and acts as the industrial department of the Chamber of Commerce. The city has built numerous new school buildings which rank in beauty with those of larger cities. In recent years a new city hall has been built in a civic center setting and is a building of beauty. During the year 1939 new structures replaced many obsolete buildings, among those being a new city market building, new modern telephone building, new Federal Court and Post Office Building, various new fire stations of the bungalow type, and a new Central Police Station, the latter being radio equipped for contact with squad cars and fire department in the city, also for contact with state highway patrol cars.

Other important buildings are the Junior College, new Benton and Lafayette High Schools, Central High School Building which is a structure of beauty and located near the Noyes Boulevard system, surrounded by beautiful homes, municipal swimming pool, tennis courts and has a large stadium with press facilities, together with athletic field for sports events. The Young Men's and the Young Women's Christian associations, Scottish Rite Cathedral, Masonic Temple, Christian Brothers College, the Home for Little Wanderers, the State Hospital for mental diseases, the Sisters of St. Joseph Hospital, Missouri Methodist Hospital, Sacred Heart Convent, and numerous fine church structures of different denominations make up a goodly number of the finer structures of the city. Other improvements consist of two baseball stadiums, one for soft ball and the other for professional use by the major leagues.

Government and Civic Conditions.—The council form of government is in force in St. Joseph, consisting of the mayor and five councilmen, all being elective offices. The city lighting is supplied by a local utility as well as natural gas used for residence and industrial consumption. The city is supplied with water through an extensive system of waterworks, first built in 1879 and improved and extended since that time until it now represents one of the finest water supply systems of any city of equal size.

History.—In 1826, Joseph Robidoux, born in St. Louis of French parentage, established a trading post at this point, known as the Blacksnake Hills, and thus became the founder of the city, which he later christened with his own name. For hundreds of miles on every side the whole country was then an unbroken wilderness, inhabited only by the aborigines, who gained a scanty subsistence by trapping and hunting. The furs and pelts of the wild animals they killed soon became a source of extensive traffic between the trader and his Indian neighbors. The famous Platte Purchase was accomplished through a treaty with the Indians, dated Sept. 17, 1836. The trading post grew into a town, incorporated in 1845 and then into a city, incorporated in 1851. Its growth at first was not rapid, but steady and gradual. Planted, however, in the midst of one of the finest and wealthiest agricultural sections of the United States, and drawing to itself the larger part of the trade that came from the country to the westward, it later on began to assume a more vigorous and rapid growth. In 1880 it had a population of 32,431; in 1940, 75,711; and in 1950, 78,588.

SAINT JOSEPH, island in Lake Huron belonging to Canada. It is at the mouth of St. Mary's River and near the mainland of both Michigan and Ontario. There are many high bluffs and large rocks on the coast, but nearby the whole of the surface is covered with trees, shrubs and flowers.

SAINT JOSEPH, lake in northwestern Ontario, Canada; 187 square miles. The Albany River is its outlet into James Bay.

SAINT JOSEPH, (1) river, Michigan, whose source is in Hillsdale County. It flows west-northwest, then south into Indiana, west, then northwest, returning to Michigan and entering Lake Michigan at St. Joseph, Mich. South Bend, Ind., is on the banks of this river,

at the head of navigation. Its total length is about 250 miles. (2) Another river of the same name rises in the southwestern part of Michigan, crosses the northwestern corner of Ohio, enters Indiana and flows southwest and unites with Saint Mary's River at Fort Wayne, to form the Maumee (q.v.). Its total length is about 100 miles.

SAINT JOSEPH D'ALMA, săn zhō-zĕf' dăl-mà', town, Quebec; county seat of East Lake St. John County; located on Alma, an island in Lake St. John, at the point where the waters of the lake discharge into the Saguenay River. There is a railroad connection with Jonquière, and the town has some industry, a bank, a weekly newspaper, and a chamber of commerce. Pop. (1951) 8,028.

SAINT-JUST, săn zhüst', **Louis Antoine Léon de,** French revolutionary: b. Decize, France, Aug. 25, 1767; d. Paris, July 28, 1794. The son of an army officer, he received a good education, read widely, and was influenced by the writings of Jean Jacques Rousseau to attach himself to the republican movement that deposed Louis XVI. He corresponded with Maximilien François Marie Isidore de Robespierre (q.v.), and through Robespierre's influence in 1792 was elected deputy for Aisne in the revolutionary National Convention. His maiden speech to the Convention was a plea for harsh treatment of Louis XVI.

Saint-Just became a member of the Committee of Public Safety (q.v.) in 1793 and subsequently helped to bring the Convention under its domination. With Robespierre he prepared the Reign of Terror, organizing the destruction of the Girondist (q.v.), or moderate, revolutionary faction and the execution of numerous émigrés and suspected monarchists.

Meanwhile, in the fall of 1793, French republican armies on the Rhine were yielding before an invasion by various European monarchies in coalition, and Saint-Just was dispatched by the Committee of Public Safety as a special commissioner to redress the military situation. He was brilliantly successful, and on his return was elected president of the Convention. He formed with Robespierre and Georges Couthon a temporarily invincible triumvirate which secured the execution of numerous opponents in the Convention, notably Jacques René Hébert and Georges Jacques Danton. In July 1794, Saint-Just was recalled to Paris from a mission to the republican army of the north, in Belgium. Robespierre was threatened by various political enemies and needed his help. On July 27 (the 9th of Thermidor), Saint-Just tried to advocate in the Convention a dictatorship controlled by Robespierre's faction. He was interrupted, denounced, and arrested. The next day, with Robespierre and others, he was guillotined. Saint-Just was the author of numerous political writings. See also FRENCH REVOLUTION.

Consult Bruun, Geoffrey, *Saint-Just: Apostle of the Terror* (New York 1932).

SAINT KILDA, sânt kĭl'dà, island, Scotland, of the Outer Hebrides group, located in the Atlantic Ocean, off Scotland, about 40 miles west of North Uist. It is three miles long and two miles wide, but has only about 40 acres of arable land. Its shores rise in perpendicular cliffs except for a landing place on the southeast. The highest point is 1,220 feet. The population dwindled from 110 in 1851 to 35 in 1935, when all inhabitants removed to the mainland and the island became a bird sanctuary.

SAINT KITTS, West Indies. See SAINT CHRISTOPHER.

SAINT LAMBERT, sânt lăm'bĕrt, Fr. săn läN bâr', residential city, Quebec, Canada; located in Chambly County, on the south shore of the St. Lawrence River, immediately opposite Montreal. It is at the end of the Victoria Bridge of the Canadian National Railway and has extensive railway yards. Pop. (1951) 8,416, about one-third French speaking.

SAINT LAURENT, săn lô-räN', **Louis Stephen,** prime minister of Canada: b. Compton, Quebec, Canada, Feb. 1, 1882. The son of a French-Canadian storekeeper of Compton and an Irish-Canadian mother, he was educated at St. Charles College, Sherbrooke, and at Laval University, Quebec, where he was graduated at law. He was admitted to the bar in 1905 and appointed professor of law at Laval University in 1914. A King's Counsel in 1915, he served as batonnier of the Quebec City Bar, was batonnier-general of the bar of the Province of Quebec from 1929 to 1930, and for the next two years was president of the Canadian Bar Association. In December 1941, he was appointed minister of justice and attorney general for Canada in the Cabinet of Prime Minister W. L. Mackenzie King. First elected to Parliament as Liberal member for Quebec East in 1942, he was returned again in elections held in 1945, 1949, and 1953. He resigned from the Ministry of Justice in 1946 to become secretary of state for external affairs. He was deputy chairman of the Canadian delegation to the United Nations Conference in San Francisco in 1945 and chairman of the Canadian delegation at the first session of the United Nations General Assembly in London early in 1946. On the retirement of Prime Minister Mackenzie King, Nov. 15, 1948, Saint Laurent succeeded to the premiership.

Speaking French and English with equal fluency, he was the second French-Canadian to become prime minister. In 1951, on the tenth anniversary of his entry into federal politics, all parties in Parliament joined in an unusual expression of appreciation for his services to Canada. His name is particularly associated with his support of grants to the provinces for the conservation of water resources and for aiding the fisheries industry.

SAINT LAURENT, residential town, Quebec, Canada, on the Island of Montreal, west of Mount Royal and Montreal proper. It is part of Greater Montreal and is connected with Montreal by rail, bus, and tramway. Local plants produce sheet metal products, medical and pharmaceutical preparations, and cooking apparatus. Originally a mission, St. Laurent was incorporated as a village in 1845 and as a town in 1901. Pop. (1951) 19,918.

SAINT LAWRENCE, Cape, sânt lâ'rĕns, the northwest projection of Cape Breton Island, Nova Scotia, into the Gulf of St. Lawrence, 65 miles north-northwest of Sydney.

SAINT LAWRENCE CANALS. See CANADIAN CANALS—*St. Lawrence Canals.*

SAINT LAWRENCE ISLAND, island, Alaska, in the Bering Sea southwest of Seward Peninsula, about 120 miles from the Alaskan mainland. It is about 95 miles long and from 10 to 35 miles wide, with rugged terrain rising to 2,070 feet. All vegetation is of the tundra type. The island is inhabited by Eskimos engaged in whaling and fox trapping. Eskimo cultures here, traced back 2,000 years, are of interest to anthropologists. The island was discovered in 1728.

SAINT LAWRENCE RIVER AND GULF. The St. Lawrence, a major river of North America, is the only important one whose course trends roughly from west to east. Hence, its valley forms a part of the international boundary between the United States and Canada.

It drains the most extensive bodies of fresh water in the world, the five largest appropriately called the Great Lakes. These give it the unique distinction of having more than 95,000 square miles of its drainage area composed of water surfaces.

On some maps the St. Lawrence is depicted as merely providing the outlet of Lake Ontario and terminating where its broad estuary merges some 750 miles away into a gulf of the Atlantic. But a more correct appraisal would chart its source from the St. Louis River, winding through the forests of upper Minnesota to empty into the farther corner of Lake Superior; for such remote streams and the lakes which receive their waters are all essential parts of one great river system whose length exceeds 2,100 miles and whose drainage area embraces 565,000 square miles.

The St. Lawrence is a relic of the ice age. In contrast with the Colorado, which has gnawed at its cavernous gorges for millions of years, the St. Lawrence is comparatively youthful. It took form when the continental ice fields, which once covered four million square miles of North America, retreated toward the Arctic leaving a maze of lakes and swamps and worn down uplands; of terminal moraines and deeply etched valleys. In the course of its development from this topographical chaos, the St. Lawrence appropriated some areas once served by the Mississippi and the Hudson.

Long ago, when warmer temperatures prevailed, the beds of the Great Lakes were the valleys of forgotten rivers which probably differed little from that of the Ohio. Their erosions were accelerated by the gouging of great masses of slowly moving ice that may have attained a maximum thickness of nearly two miles. The bed of Lake Superior is of particular interest, for later strata seem to have been worn away down to the ancient Paleozoic floor. Not only were the basins of the lakes deepened and enlarged but vast deposits of glacial clay and sand and coarser drift remodeled their outlines. In some places these deposits are two hundred feet deep.

As the ice fields retreated their melting waters inundated much greater areas than they do today. Then individual lakes enlarged their bounds or coalesced with others to form super lakes. Such glacial monstrosities as Algonquin and Iroquois have been traced in plainly marked beaches. Some of these beaches south of Lake Erie are now 220 feet above the prevailing water levels, east of Lake Huron they are 260 feet, while above the north shores of Superior they have been etched in the uplands as much as 600 feet above the surface of that inland sea. The soils exposed along these beaches differ greatly from the remoter uplands and possess many of the characteristics of silted lake beds.

A current flows continuously through the Great Lakes sustained by an annual precipitation of more than 30 inches. But the St. Lawrence is also swelled by important tributaries. Among these are the Richelieu, flowing northward from Lake Champlain, the Ottawa, 605 miles long, bearing from the west the surplus of many glacial lakes, and the Saguenay, sweeping down from interior Ontario, guarded by those giant cliffs, Capes Trinity and Eternity.

At Niagara the St. Lawrence is interrupted by one of the world's great waterfalls, a scenic marvel and the source of enormous water power. There are other natural obstructions to traffic, the rapids of the Sault Ste. Marie now flanked by gigantic locks, and the Lachine Rapids above the city of Montreal. The northern shores of Superior, which form the edge of the Great Canadian Shield, are grand and imposing, while the Thousand Islands of the St. Lawrence (they really total more than 1,500) attract innumerable visitors.

The first white man of record to sail the St. Lawrence was Jacques Cartier in 1534. He called it the River of Canada, but St. Lawrence, the name he had bestowed upon the outer gulf, was, by a vagary of history, preferred for the entire system.

For a long time the St. Lawrence was the only river appearing upon the sketchy maps of North America. Daring adventurers, eager to create a French Empire in the New World, found it a broad highway into the hinterland. In 1603 Champlain established the first French settlement at Tadoussac, at the mouth of the Saguenay, and five years later laid the foundations of Quebec. In 1679 La Salle voyaged from Erie to Michigan on the *Griffon,* the first sailing vessel to navigate the Great Lakes. On the remotest shores of Superior the Sieur Du Lhut built the trading post destined to become Duluth. Meanwhile, French voyageurs followed natural waterways into the wilderness of the great northwest, fur buyers and traders with the Indians.

The St. Lawrence Valley was long a battle ground for warring tribes. The Iroquois, dwelling from the Adirondacks through the Finger Lake region, almost annihilated the less aggressive Eries and Hurons, who yet gave their names to two of the five Greak Lakes. Such hostilities persisted during the French and Indian Wars, for the struggle for world power between France and England, which had spread from the Mediterranean to the West Indies and India, involved Canada also. When Quebec, the western Gibraltar, fell to the army of General Wolfe, the tenuous French Empire in the northern sector of the continent collapsed. But hostilities broke out afresh in the War of the Revolution. Then Benedict Arnold led his daring attack on Montreal and General Burgoyne, thrusting southward down the Champlain Valley, almost succeeded in splitting the rebellious colonies in twain. The embers of conflict flamed afresh in the War of 1812, when American reverses at Niagara and Detroit were brightened by the naval victory on Lake Erie. Thereafter the energies of the two great English speaking peoples turned from conflict to more productive pursuits.

The settlement and commercial development of the St. Lawrence Valley is a more thrilling

romance than the former era of fur trapper and explorer. No other river system in the world can rival its multiplicity of enterprises or the volume of traffic upon its unequalled waterways. The eight states and two Canadian provinces which border its lakes and rivers have a combined population exceeding 45,000,000, including such American centers as Chicago, Detroit, Cleveland, Milwaukee, and Buffalo; and such Canadian cities as Montreal, Toronto, Quebec, and the beautiful capital at Ottawa.

The fisheries of the Great Lakes, though declining, have long been important. Forest resources are impressive and great rafts of pulp logs float across Superior. Among important mineral deposits the iron and copper mines of Michigan and the fabulous Mesabi Range in Minnesota are outstanding. The transportation of grain and iron ore has developed a unique type of ship, the turtle-backed steamer of the Great Lakes. Among manufacturing enterprises which have multiplied enormously are steel plants and automobile works.

The one major handicap is winter. Then, for several months, lake shipping seeks a harbor, and ice three feet thick forms on the upper river. But even then winter sports flourish, ice palaces are erected at Montreal and Quebec, and skiing, snowshoeing, and hockey exert an ever wider appeal.

In those weak links, where navigation is interrupted, man has assisted nature by digging canals and dredging channels. Although the Soo exit from Superior is closed for five months each year, more shipping passes through its locks than through the combined Suez and Panama canals, while the Detroit River has been called the busiest waterway in the world.

Ocean steamers ascend the St. Lawrence to Montreal. There canals bypass the rapids and flank Niagara to link Erie with Ontario. But as these limit vessels to a draught of 14 feet, a deeper ship canal has long been advocated. (See SAINT LAWRENCE SEAWAY.)

Estuary and Gulf.—Beyond Quebec the St. Lawrence assumes true Amazonian dimensions, nor is it clear where river terminates and sea begins. At Anticosti Island it is 90 miles across. Beyond that point horizons broaden into the spacious Gulf of St. Lawrence, nearly landlocked by Ontario, New Brunswick, Nova Scotia, Cape Breton Island, Newfoundland, and Labrador. Besides Anticosti it encloses Prince Edward Island and the Magdalen group. The estuary and much of the gulf fill a drowned valley, for the river channel has been traced to the edge of the continental shelf, a hundred miles beyond the shore line. The gulf opens into the Atlantic through the Gut of Canso which cuts off Cape Breton Island from Nova Scotia, Cabot Strait between Cape Breton Island and Newfoundland, and the Strait of Belle Isle, often choked with grounded icebergs, which separates Newfoundland from Labrador.

SAINT LAWRENCE SEAWAY, a projected navigable channel to connect the Great Lakes with the St. Lawrence River, thus making possible direct oceanic trade with the interior of Canada and the United States. The project was first proposed by the American-Canadian Deep Waterways Commission in 1897, and, after more than 50 years of negotiations marked by vigorous opposition from contending interests in the United States, a bill was passed by Congress and signed by the president on May 13, 1954, authorizing the United States government to participate with Canada in its construction.

The original proposals, including a power development project, were stated in the St. Lawrence Deep Waterway Treaty of 1932, which, as in the case of the Great Lakes-St. Lawrence Agreement of 1941, was rejected by the United States Congress. In 1951 the Canadian Parliament passed a bill authorizing the establishment of the St. Lawrence Seaway Authority, and in June of the next year, both countries made individual applications to the International Joint Commission for approval of power development in the International Rapids section of the St. Lawrence River. At the same time the Canadian government stated its intention to carry out, alone, the necessary work to provide deep-draft navigation between Lake Erie and Montreal.

In 1952, United States participation in the seaway project was urged by President Truman and in the following year, by President Eisenhower, as it had been by every United States president since Warren Harding. On Nov. 5, 1953, the New York State Power authority was authorized by the president to work in conjunction with the Ontario Hydro-Electric Power Commission on the proposed power project. With the final passage of the St. Lawrence Seaway bill in the next year, the president was authorized to establish the St. Lawrence Seaway Development Corporation, the counterpart to the Canadian St. Lawrence Seaway Authority. By the terms of the bill, the former would be responsible for construction of canals and locks on the 47-mile International Rapids section of the St. Lawrence River between Cornwall, Ont., and Lake Ontario. The authorization for this work, however, depended on Canada's agreement to undertake all other construction and improvements necessary to complete the seaway at a minimum depth of 25 feet from Duluth, Minn., to the Atlantic Ocean.

SAINT LAWRENCE UNIVERSITY, Canton, New York, was chartered April 1856 for the purpose of "establishing, maintaining and conducting a college for the promotion of general education and to cultivate and advance literature, science and the arts, and to maintain a theological school." Like all other colleges of the state, it is a constituent part of the educational system called the University of the State of New York. It now includes the College of Letters and Science, the Theological School, the Law School, the New York State School of Agriculture. Each department is independent of the others in its faculty and funds and in the instruction and government of its students. The College of Letters and Science offers courses leading to the degrees of bachelor of arts and bachelor of science. From the first, women have been admitted on the same terms as men. The by-laws of the corporation, adopted in 1856, provide that "the College of Letters and Science is and shall remain an unsectarian foundation." Its undenominational character has been consistently maintained. In 1857 the legislature granted to the college $25,000, of which $10,000 was to be expended for "books and apparatus" and $15,000 was to be kept as a permanent fund. The remaining productive funds of the college,

which in 1949 exceeded $2,000,000, have been the result of private gifts.

The Theological School, as provided in the bylaws of the corporation, "is and shall remain an institution especially intended and organized for the preparation and training of persons for the ministry of the Universalist Church." It was opened by Ebenezer Fisher in 1858, and the first class was graduated in 1861. The establishment of a law school was authorized in 1869, and one was maintained at Canton from 1869 to 1872, two classes being graduated. In 1903 the Brooklyn Law School was placed under the control of the university. A three-year course leads to the degree of bachelor of laws. The New York State School of Agriculture, established in 1906, is maintained by the state. It comprises an agricultural division and a domestic science division for women. No degrees are conferred on the graduates of this school as such, but certificates are given on the completion of the prescribed courses.

In 1948–1949 the university had a total enrollment of 1,445 students, of whom 424 were women. Buildings, grounds, and equipment were valued at $4,500,000 in that year, and there were 95,000 volumes in the university library.

SAINT LEGER, sânt lĕj'ĕr, or sĕl'ĭn-jĕr, **Barry,** British soldier: b. 1737; d. 1789. He served in the siege of Louisburg in 1758, and under Gen. James Wolfe at Quebec, and checked the flight of the British forces on the Heights of Abraham. In the Revolutionary War he led the expedition against Fort Stanwix. At the close of his career in the army in 1784, he was commandant of the royal forces in Canada.

SAINT LEO, town, Florida, in Pasco County; altitude 140 feet; 5 miles southwest of Dade City; served by the Seaboard and Atlantic Coast Line railroads. It is named after the Benedictine abbey of St. Leo (1889), located on the shore of the adjoining Lake Jovita, and around which the farming population grew. The abbey includes a boys' preparatory college staffed by Benedictine monks. The abbey church, open to the public, was built under the direction of the Rt. Rev. Francis Sadlier. Major industries are citrus and cattle. Pop. (1950) 261.

SAINT-LO, France, historic Norman town and capital of Manche Department, is situated on a rocky hill dominating the Vire River, about 48 miles by rail southeast of Cherbourg. Of Gallic origin, it was known during the Gallo-Roman period as Briovera, but was renamed in the 6th century for Laudus, or Lô, bishop of Coutances. The town was fortified in Charlemagne's reign, and during the Middle Ages was besieged and plundered several times. During this period it became a weaving center, and in modern times continues to manufacture textiles. During the Reformation it accepted Calvinism and was involved in the religious wars of the 16th century. In 1574 the town was attacked and a number of local Huguenots were massacred. The Church of Notre Dame, built from the 14th to the 16th centuries, was ruined in World War II, when the town, which served as a German strong point in the Normandy campaign, was besieged by Allied forces. It was liberated by the United States 29th Division on July 18, 1944. St. Lô was the birthplace of the novelist Octave Feuillet and of the astronomer Urbain Jean Joseph Leverrier (qq.v.). Pop. (est. 1948) 6,010.

SAINT LOUIS, sânt lōō'ĭs, city, Michigan, in Gratiot County, situated at an altitude of 740 feet, 36 miles west of Saginaw, on the Chesapeake and Ohio Railroad. The city was settled in 1853 and early became known as a health resort because of its mineral springs. Its industrial life centers around the refining of petroleum, flour milling, and the manufacture of beet sugar. There is also a plant producing DDT. Nearby is the Lumberjacks' and Rivermen's Park, which contains a museum of the old Michigan lumber industry. Pop. (1940) 3,039; (1950) 3,347.

SAINT LOUIS, city, Missouri, metropolis of the state and largest city of the Mississippi Valley, is situated on the west bank of the Mississippi 20 miles below its confluence with the Missouri. The site was chosen as a convenient point for trade with the Indians of the Mississippi-Missouri river system and of the Illinois and Ohio rivers as well. This central location has been a major factor in the development of St. Louis as a manufacturing and distribution center.

Topography and Climate.—Confined within boundaries fixed in 1876, the city has a frontage along the Mississippi River of 19 miles and a total land area of 61 square miles. The general elevation is 465 feet; the barometer elevation, 621 feet. The terrain, which rises from the river front, is interrupted by several low valleys.

The oldest and best known of the five bridges spanning the Mississippi at St. Louis is Eads Bridge, opened in May 1874. The overall length of the bridge and the tunnel at its western end is 6,220 feet. The tunnel passes under the main downtown business section of St. Louis and opens in Mill Creek valley, a wide depression extending westward from the river to the city limits, and one of the principal business and industrial areas. The lower end of the valley was once the site of an artificial lake, known as Chouteau's Pond, which covered more than 100 acres and was a popular resort and recreation center. When the construction of the first railroad west of the Mississippi—the Pacific Railway, now the Missouri Pacific—was begun in 1851, the valley was chosen as its course, and the lake was drained and the valley filled to form a roadbed. Mill Creek valley is now spanned by a number of viaducts.

St. Louis is the center of a metropolitan area which includes St. Louis and St. Charles counties, west of the city in Missouri, and Madison and St. Clair counties, across the Mississippi in Illinois. Among the larger incorporated areas suburban to St. Louis in Missouri are Clayton, Ferguson, Glendale, Kirkwood, Maplewood, St. Charles, University City, and Webster Groves. Directly across the river is East St. Louis, Ill., with such surrounding towns as Alton, Belleville, Collinsville, Edwardsville, Granite City, Venice, and Wood River.

The climate of St. Louis is moderate, with an average mean temperature of 56.2°F. The annual precipitation averages 37.44 inches and falls on an average of 111 days. The mean snowfall is 17.6 inches. The average percentage of possible sunshine is 59 per cent; the average relative humidity, 64 per cent; and the average wind velocity, 10.9 miles per hour.

Population.—According to the census of

1950, the population of St. Louis is 856,796, representing an increase of 4.4 per cent over the 1940 total of 816,048. Because of the restrictions on the territorial limits of the city, which periodic efforts have failed to remove, growth has been more rapid in the suburban communities of the metropolitan area. The area as a whole has the highest ratio of native-born white persons with native-born parents among the major metropolitan areas of the United States. In the city itself, approximately 87 per cent of the population is white, and some 13 per cent is Negro.

Commerce and Industry.—Founded as a fur-trading center, St. Louis was for many years the world's largest raw fur market. It also grew into one of the leading commercial, industrial, financial, and distribution centers of the United States.

Manufacturing.—According to the *Census of Manufactures, 1947,* the St. Louis Metropolitan Area ranks ninth in value added by manufacture among the 53 major industrial areas established by the Bureau of the Census and is second only to the Los Angeles Metropolitan Area among those west of the Mississippi. One of the most significant characteristics of its industry is its diversification, no more than 8 per cent of the labor force being employed in any one industry. A total of 3,300 different products are manufactured in the area. Despite its territorial restrictions, the city of St. Louis accounts for most of this industrial activity, with 2,330 manufacturing establishments of the 2,960 in the area as a whole in 1947. According to the census taken in that year, the value added by manufacture was $1,296,471,000 for the area, of which $911,107,000 was contributed by the city.

In addition to its strategic location and moderate climate, the principal factors in St. Louis' industrial development have been its proximity to sources of raw materials, adequate fuel and water supplies, excellent transportation facilities, and ample steam and hydroelectric power. The waterpower is generated from the Mississippi River and at a large plant on the Osage River, where, in 1929–1931, Bagnell Dam was built, forming the 20,000-acre Lake of the Ozarks.

Principal manufactures include: alloys and alloy castings, aircraft and parts, automobiles and parts, bakery products, beer, bricks, candy, caskets, chemicals, clothing, drugs, electrical machinery, food preparations, footwear, furniture, hardware, iron and steel castings, machine shop products, meat packing, millinery, paints and varnishes, paper products, prepared animal feed, railroad cars, refrigerators, roofing, steel works and rolling mill products, stoves, textile bags, tin cans, tobacco, and wirework. Of particular consequence since the 1930's is the growth of the city as a producer of chemicals and as a center of women's fashions.

Wholesale Trade.—Its surrounding territory unbroken by natural barriers, St. Louis is one of the major distribution centers of the United States. Wholesale sales from the St. Louis market approximate $3,000,000,000 a year. The principal groups in this trade are dry goods and clothing; food and tobacco; farm products; automotive products; metals and minerals; machinery equipment and supplies; chemicals, drugs, and allied products; electrical, lumber, and building products materials; hardware; petroleum and products; paper and products; plumbing; furniture and home furnishings; and sporting goods.

Retail Trade.—Some 5,000,000 people live within a radius of 150 miles of St. Louis, a district which embraces rich agricultural land, the oilfields and coalfields of Illinois, the largest lead mines in the world, and a wide range of other industrial and commercial activity. The retail sales of the city proper approximate $1,165,000,000 a year, or over $1,300 per capita. Since the 1930's there has been an extensive growth of outlying shopping centers in the northwest and southwest sections of the city, and outside the city limits in St. Louis County.

Transportation and Communications.—St. Louis is second only to Chicago among the railroad centers of the United States. It is served by 18 trunkline railroads: Baltimore & Ohio; Chicago & Eastern Illinois; Chicago, Burlington & Quincy; Chicago, Rock Island and Pacific; Gulf, Mobile and Ohio; Illinois Central; Illinois Terminal; Litchfield and Madison; Louisville & Nashville; Missouri-Kansas-Texas; Missouri Pacific; New York Central; New York, Chicago and St. Louis; Pennsylvania; St. Louis-San Francisco; St. Louis-Southwestern; Southern; and Wabash. There are 2 shortline railroads with terminals in the city—the St. Louis, Belleville Electric and the St. Louis & O'Fallon. There are also 4 switching railroads in St. Louis —the Alton and Southern; East St. Louis Junction; Manufacturers; and Terminal Railroad Association of St. Louis—and 1 in Alton, the Missouri & Illinois Bridge & Belt. The Union Station, at 18th and Market streets in the Mill Creek valley, is used for passenger service by all the principal railroads except the Illinois Terminal.

Since its founding St. Louis has relied heavily on river transport. Today it stands at the center of the Mississippi River Waterway, the largest inland waterway in the world (see MISSISSIPPI RIVER; WATERWAYS OF THE UNITED STATES). The Federal Barge Lines and the Mississippi Valley Barge Line Company provide long-haul freight service by barge from St. Louis, operating to the south the year around and to the north for eight months of the year. In addition, irregular barge transport is available.

The focal point of a network of modern highways, the city is also served by buses and trucks with service to, or connections with, every section of the country. A total of 269 trucklines and 22 regularly scheduled buslines operate out of St. Louis.

Five major airline companies serve the city: American Airlines, Chicago & Southern Air Lines, Trans World Airline, Eastern Air Lines, and Mid-Continent Airlines. One all-cargo carrier, Slick Airlines, and several charter lines were also in operation in 1950.

There are three daily newspapers: the *Post-Dispatch,* formed by a merger of the *Post* and the St. Louis *Dispatch* made by Joseph Pulitzer in 1878; the *Globe-Democrat,* formed in 1875 by the consolidation of the *Globe* and the *Missouri Democrat* (founded in 1852); and the *Star-Times,* formed by a merger of two earlier newspapers (founded in 1878 and 1895, respectively) in 1935. As of 1950, there were 9 standard AM broadcasting stations, 3 FM stations, and 1 television station operating in the city.

Government.—Before 1876 the city and St. Louis County formed a judicial, and, in certain respects, an administrative, unit. In that year the city and county were separated, the boundaries

of the city were enlarged to their present limits, and a new city charter was adopted. The charter provided for the election of the mayor for a term of four years, with enlarged powers; for the division of the city into 28 legislative districts, or wards; for the continuance of a bicameral city council; for the establishment of a department of health; for an elective public school board consisting of one member from each of the wards; and for the creation of other boards and agencies.

In 1914 a new charter, introducing several important changes in the city's government, was put into effect. The number of elective offices was reduced; the appointive powers of the mayor were increased; the city council, or board of Aldermen, was made a unicameral body, and each member was required to reside in the ward he represented; the budget system was introduced; the right to municipal ownership of public utilities was granted; and provision was made for the use of the initiative, referendum, and recall.

Although the city has been a separate political unit since 1876, it retains certain features of county administrative procedure. The mayor has the right of appointment of top administrative officers, but most of the municipal employees in lesser positions come under a civil service system which greatly restricts his appointive powers. Such county officers as the sheriff, recorder of deeds, and public administrator have been retained. The police force, which is part of the St. Louis metropolitan system created by the state legislature in 1881, is under the direction of a board of police commissioners appointed by the governor; the mayor is an ex officio member of this board. Also under the control of the state are the functions of the collector of revenue, license collector, and board of election commissioners.

Educational and Cultural Facilities.—St. Louis is one of the leading cultural centers of the United States. Its educational facilities embrace a modern public school system, including vocational schools, junior colleges, and teachers colleges; a number of private and parochial elementary and secondary schools; and several institutions of higher learning. Among the latter are Washington University (q.v., nonsectarian), St. Louis University (q.v., Roman Catholic), and Concordia and Kenrick seminaries. In addition, there are numerous technical and professional schools. Both Washington and St. Louis universities maintain excellent medical schools which are affiliated with St. Louis hospitals.

The city has outstanding library facilities. The central building of the Public Library, a three-story granite edifice of Italian Renaissance design near the downtown section, was erected in 1912; it circulates more than 2,000,000 books a year and has extensive reference facilities. There are also 19 branch libraries, a mobile service, and service to the public schools. The St. Louis Mercantile Library Association, founded in 1846, is the oldest institution of its kind west of the Mississippi River; it maintains a subscription library with 179,225 volumes (1945). Other collections include those of the universities, the Academy of Science, the Law Library Association of St. Louis, the Missouri Historical Society, and the Missouri Botanical Garden.

The headquarters of the Missouri Historical Society is the Jefferson Memorial, a two-story, white limestone building of modified classic design, which stands on the site of the entrance to the Louisiana Purchase Exposition of 1904 and was built from funds remaining at the close of the exposition. Donated to the city by the directors of the exposition, it was opened to the public in 1913. In the center of the loggia is a large bronze statue of Thomas Jefferson by Karl Theodore Francis Bitter, while a wall of the east wing of the memorial contains a relief by the same artist portraying James Monroe, Robert R. Livingston, and Marquis François de Barbé-Marbois signing the Louisiana Purchase Treaty. The east wing houses the historical society's offices; the library, which has an extensive collection of books and manuscripts pertaining to the state and region as well as one of the largest collections of Jefferson manuscripts in the United States and many of the manuscripts relating to the Hamilton-Burr controversy; and a large museum of Missouriana. The west wing contains trophies received by Charles A. Lindbergh following his flight to Paris in *The Spirit of St. Louis* in 1927.

Founded by Henry Shaw, a St. Louis philanthropist, in 1858, and opened to the public in 1860, the Missouri Botanical Garden (also called Shaw's Garden) contains the largest collection of plant life in the Western Hemisphere, with representatives of more than 12,000 species. In addition to the city garden of 75 acres, there is an arboretum of 1,625 acres at Gray Summit, Mo., and a tropical extension at Balboa, Panama. All facilities are maintained through an endowment set up by Shaw, and admission is free. At the city garden, in addition to extensive outdoor gardens there are large conservatories containing a varied collection of tropical plants and featuring displays of chrysanthemums, orchids, lilies, tropical vines, ferns, palms, desert cacti, and plants from Australia, the Philippines, and Japan.

The City Art Museum of St. Louis, situated on top of Art Hill in Forest Park, is a Bedford stone structure of classic Roman architecture, erected as the main art building of the Louisiana Purchase Exposition and donated to the city by the exposition committee. In front of the museum is a bronze equestrian statue of Louis IX of France, for whom the city was named. The museum contains rich exhibits of paintings, casts, sculpture, drawings, and applied art. It has a fine collection of Chinese bronzes, pottery, and painting. Since 1907 a direct tax has been levied for the support of the museum. Admission is free.

The Henry W. Kiel Municipal Auditorium, a stone building of modified classic design completed in 1934, contains a convention hall seating 11,500, an opera house seating 3,500, and various assembly halls. In the Auditorium Opera House the concerts of the St. Louis Symphony Orchestra and the presentations of the Grand Opera Association and other groups are given. The orchestra, one of the oldest in the United States, was founded in 1880; concerts are given from October to March. Grand opera is presented annually under the auspices of the association.

The St. Louis Municipal Theater, in Forest Park, is an outdoor theater seating more than 10,000 persons; 1,700 places are free nightly. Since 1919 light operas and operettas have been presented here each summer. The Muny Opera, as it is popularly called, has a season lasting 12 weeks and attracts an annual attendance of more than 750,000.

Other cultural organizations in the city include the St. Louis Playgoers Association, which

sponsors the presentation of legitimate plays; the Little Theatre, established in 1926; the Light Opera Guild; and the St. Louis Artists' Guild (see section on *History*).

Parks, Recreational Facilities, and Other Points of Interest.—St. Louis has 69 parks, covering approximately 3,000 acres, and some 50 playgrounds. The city maintains over 100 tennis courts, many baseball and softball grounds, football and soccer fields, fly and bait casting docks, horseshoe courts, archery ranges, and golf courses. A number of the parks have facilities for skating and canoeing and bridle paths. Outdoor and indoor swimming pools, community center buildings, and public bathhouses are also maintained by the city.

The largest of the parks, Forest Park, covers 1,382 acres and is a center for much of the city's recreational and cultural activity. In addition to the buildings described in the section on *Educational and Cultural Facilities,* it contains the Jewel Box, a steel and glass conservatory housing floral displays from the city's greenhouses; three golf courses and numerous athletic fields; and the 77-acre Zoological Garden (St. Louis Zoo), which has some 2,000 animals. Planned to show the animals in natural settings, the zoo has pioneered in the construction of replicas of natural geological formations. Such special features as the chimpanzee circus and the elephant, lion, and other shows are very popular. The zoo is supported by a direct municipal tax.

O'Fallon Park, in the northern part of the city, covers 159 acres and occupies a commanding position overlooking the Mississippi. Tower Grove Park (277 acres), in the southern part of the city adjacent to the Missouri Botanical Garden, was also given to the city by Henry Shaw. It contains a wide variety of rare trees and shrubs. Around a statue of William Shakespeare are memorial trees planted by noted Shakespearean actors of former times. Chain of Rocks Park, in the extreme northern section of the city, affords a good view of the river; Fairgrounds Park, also in north St. Louis and formerly the scene of county fairs and horse races, now contains a large swimming pool and extensive playground facilities. Lafayette Park, the oldest in the city, was set aside from the city commons in 1836. The city also maintains Tilles Park in St. Louis County, a wooded tract of 58 acres equipped with a wading pool, tennis courts, fireplaces, and other facilities.

All parks and recreational facilities are under a municipal department, and the city has pioneered in the encouragement of recreation and outdoor sports. The Municipal Athletic League, conducted under city auspices, consists of baseball, soccer, basketball, tennis, swimming, and other groups; it has done much to broaden participation in amateur sports. In the professional field, the city is the home of two major league baseball clubs, the Cardinals of the National League and the Browns of the American League. Both teams play at Sportsman's Park, which is in the north central part of the city. Professional ice hockey games and other sports are presented in the large indoor Arena. Wrestling matches, prize fights, and other sports events are held in the Municipal Auditorium.

Boating and yachting on the Mississippi are popular, as are day and evening steamer excursions. A few miles west of the city is Babler Memorial State Park, a wooded tract of more than 1,000 acres. In addition, the Missouri Ozarks are easily accessible from St. Louis, and the Lake of the Ozarks (see section on *Manufacturing*) attracts many visitors from the city.

Among the principal events in St. Louis each year is the visit of the Veiled Prophet, a mystical monarch whose identity remains secret. His arrival early in October is heralded by a parade of 20 floats, colorfully designed, usually with storybook themes. On the following evening he rules over a formal ball at which he crowns a St. Louis debutante to reign in his stead for the ensuing year. The ball, first held in 1878, is considered the opening of the fall social season. More recent is the annual celebration of St. Louis Week, sponsored by the city administration and the St. Louis Chamber of Commerce. It features an exhibition at the Municipal Auditorium of the activities of municipal departments and public agencies.

Many of the major public buildings of St. Louis—the City Hall, the Public Library, the Municipal Auditorium, the Municipal Courts Building, the United States Customs and Courthouse Building, the Civil Courts Building, the Soldiers' Memorial Building—are grouped around Memorial Plaza, which forms the Civic Center. The Civil Courts Building, a 14-story structure completed in 1930, is an unusual combination of architecture. The first 12 stories, of modern office building design, are surmounted by an Ionic temple, which is crowned by an Egyptian pyramid. The Soldiers' Memorial Building, completed in 1938, is a two-story white granite edifice. The first story comprises a loggia and two museums surrounded by a portico with large, squared columns. The loggia contains a cenotaph with the names of the 1,249 St. Louis soldiers who were killed in World War I; the museums house war trophies and relics. The second story, a plain superstructure, is used chiefly as assembly rooms for service organizations. Directly in front of the building and in the center of the plaza is a monument to those who died in World War II. Farther downtown is the Old Court House, a two-story Classic Revival structure, shaped somewhat like a cross and surmounted by a 128-ton cast iron dome, rising to a height of 198 feet. It was built chiefly between 1839 and 1845, but was not entirely finished until 1862. It has many associations with the early civic life of St. Louis, and is identified especially as the place where the Dred Scott case (q.v.) was first tried.

Also on Memorial Plaza is Christ Church Cathedral (Protestant Episcopal), a Gothic structure built between 1859 and 1867, with additions made in 1894 and 1911. The most historic church in the city is the Roman Catholic Church of St. Louis of France (until 1914 the cathedral of the St. Louis archdiocese), a limestone edifice of Greek Revival design. Erected in 1831–1834, it is the fourth building on the site on which the first mass in St. Louis was celebrated, in 1764. The Cathedral of St. Louis, begun in 1907 and dedicated in 1914, is a gray granite edifice of Byzantine architecture, with the floor plan in the shape of a Greek cross. It has three domes, the central one rising to a height of 227 feet, and two towers, which attain a height of 157 feet. There are two large rose windows, and the interior is decorated with mosaic panels and various works of religious art.

Among other points of interest in the city are Aloe Plaza, opposite Union Station, which has a

200-foot pool and a fountain with cast bronze figures executed by Carl Milles (q.v.), called *The Meeting of the Waters;* the Old Rock House (1818), on the river front, which was used as a headquarters by the early fur traders; the Old Arsenal, dating from 1830; the Eugene Field House, now a museum, where the poet was born in 1850; and the Robert Campbell House, the ante-bellum home of one of the city's pioneer families, maintained as a museum. Near the city is the log cabin where Ulysses S. Grant lived as a young man.

St. Louis has cleared a 70-block area on its river front for the creation of a memorial to Thomas Jefferson and the Louisiana Purchase. In 1950 plans contemplated the construction of a large stainless steel arch 590 feet high, symbolizing the gateway to the West. The section along the river is in the hands of the National Park Service, which maintains local headquarters and a museum in the Old Court House.

History.—What is today the city of St. Louis was founded in 1764 by Pierre Laclède Liguest, better known as Pierre Laclède, as a settlement for the development of the fur trade west of the Mississippi River, that trade as far north as the St. Peters River having been conceded by the director general of Louisiana in 1762 to Col. Gilbert Antoine de St. Maxent and himself exclusively for a period of eight years. Acting on behalf of the syndicate of Maxent, Laclède, and Company, formed in New Orleans for the operation of the concession, Laclède set out with a party and supplies in August 1763 and arrived some weeks later at Fort Chartres, on the east bank of the Mississippi, below what was to become St. Louis, where he made his winter headquarters. In December he selected for his settlement a site on the west bank of the river, and early the following year sent over from the fort 30 workers to clear the ground and erect buildings, the work being directed by his 14-year-old stepson, René Auguste Chouteau (q.v.). The settlement, which Laclède named St. Louis, in honor of Louis XV and of the king's patron saint, Louis IX. After the surrender of Fort Chartres to the British in 1765, following the transfer of the French territory east of the Mississippi to Great Britain in 1763, other settlers moved to St. Louis from the French settlements of the fort and its vicinity.

Although the fur trade of the company was substantial from the outset, soon attaining a value of about $75,000 annually, the community encountered many difficulties during its early years. So short was the bread supply prior to 1767 that the settlement became widely known as Paincourt (Short Loaf). Following the surrender of Fort Chartres, its former commandant, Capt. Louis St. Ange de Bellerive, came to St. Louis with the soldiers under his command and established rule over the community and over Upper Louisiana. He was confirmed as local commander by Antonio de Ulloa, when he arrived in New Orleans in 1766 to effect transfer of Louisiana to Spain under the terms of the Treaty of Fontainebleau (1762). During his rule he gave to settlers of the community 81 titles to local parcels of land on the simple condition that the recipients improve it within a given period. With the arrival in 1770 of Don Pedro Piernas as the first Spanish lieutenant governor of Upper Louisiana, of which St. Louis served as the seat of government, de Bellerive's rule was terminated. Most of what had been done previously, however, was approved by Piernas, who appears to have pursued policies largely familiar and acceptable to the local population. In 1780, St. Louis was attacked by a contingent of British troops aided by a band of Indians, but it succeeded in repelling them despite its poor defenses. Toward the end of the century people from the United States began to settle in and near St. Louis and, with the purchase of Louisiana from France (to which it had been retroceded by Spain in 1800 by the Treaty of San Ildefonso) by the United States in 1803, their number steadily increased. The formal transfer of Upper Louisiana was made by the Spanish lieutenant governor, Col. Carlos Dehault Delassus, at St. Louis on March 9, 1804, to Capt. Amos Stoddard of the United States Army, who had been commissioned to act as agent for both France and the United States, the actual transfer occurring on March 10. Later in the same year the United States Congress created the District of Louisiana, with the seat of government at St. Louis, and in 1812 the Territory of Missouri, which in 1821 became the state of Missouri. Soon thereafter the capital was removed from St. Louis to nearby St. Charles, where it remained until 1826, when it was transferred to Jefferson City.

At the beginning of United States rule, St. Louis had a population of a little over 1,000, predominantly French, though there were a number of Americans, while the population of the outlying district on the west side of the Mississippi was slightly larger and about two thirds American. In 1808, St. Louis had 200 houses, about one fourth of which were of stone, and in the following year it was incorporated as a town. By 1821 its population had reached 5,600, and in 1822 it was chartered as a city, effective in 1823.

For many years after its founding the commerce and industry of St. Louis centered around the fur trade of the Missouri Valley and the Northwest. Among the early fur traders, whose operations in this region were conducted from St. Louis, were, in addition to Laclède, René Auguste Chouteau and Jean Pierre Chouteau (q.v.), two of the first settlers, and Manuel Lisa and Andrew Henry. In 1809 the St. Louis Missouri Fur Company was organized by Lisa, the Chouteaus, Henry, and others, but it was dissolved in 1814, and for several years thereafter its members engaged in the trade independently. One of the most successful of the traders was Lisa, who with Theodore Hunt in 1814 formed the Missouri Fur Company, and after its dissolution in 1817 organized another company under the same name (1819). He headed various trading expeditions and brought to St. Louis in a single season 15,000 buffalo skins. On June 14, 1817 he brought in a cargo of furs of various kinds valued at $35,000. In 1822, John Jacob Astor established at St. Louis the western department of the American Fur Company, thus intensifying the bitter competition with the St. Louis traders. In 1827 an alliance between the two groups was formed, through which the American Fur Company dominated the fur trade of the Northwest. Upon Astor's retirement in 1834, the business of the firm was divided. With the rapid rise of other local industries after 1840, the fur trade began to occupy a less conspicuous place in the commercial life of the city, although it continued for many years to play an important role.

The trade of the community was conducted chiefly by barter until the early part of the 19th

century. The first local bank, the Bank of St. Louis, was opened in 1816 with a capital of $100,000, but failed in 1819. The Bank of Missouri (private), opened in 1817, also failed, in 1821. The business of the town at this time was valued at around $1,000,000 a year. In 1829 a branch of the Bank of the United States was opened in the city. After the closing of this bank by President Andrew Jackson, the Bank of Missouri (state) was chartered in 1837, the central organization being located in St. Louis. Subsequently various private banks were organized, and in 1866 the state bank was sold to a private syndicate, the state abandoning its banking enterprise.

Prior to about 1840 the industrial development of St. Louis was slow. Its early manufactures were on a small scale, and included lumber, bricks, flour, foundry products, shoes and leather goods, furniture, lead, and tobacco. During the 1840's, however, it began to make rapid strides industrially as well as commercially. By the middle of the century its industries had greatly expanded, and its leading manufactures included stoves, foundry products, flour, sugar, brewery products, shoes and leather goods, cotton goods, lumber products, bricks, furniture, steamboats, tobacco, lead, and glass. It was also one of the leading meat packing centers of the United States. In 1860 the city had over 1,100 manufacturing establishments of various kinds, producing goods valued at approximately $27,000,000 annually.

Contributing greatly toward its industrial development was the improvement in its transportation facilities, which began with the introduction of steamboat service in 1817, when the *Zebulon M. Pike* arrived from Cincinnati. The trip between St. Louis, New Orleans, and other points along the Mississippi and Ohio, which previously had required weeks by sailboat, was reduced to days. Although the progress of steamboat service was slow at first, it began to advance rapidly during the 1830's. Steamboat arrivals in 1838 totaled 154, and by about 1850 St. Louis was third in rank among American cities in enrolled tonnage. Vessels arriving in 1860 numbered 5,178, and departures 5,218, while the total shipping cleared through the port was 844,039 tons. With the completion in 1852 of the first section of the Pacific Railway, railway service from St. Louis westward was begun. The building of other Western railways soon followed. Meanwhile, the completion and opening in 1857 of the Ohio and Mississippi Railroad, between St. Louis and Cincinnati, connecting with the Baltimore & Ohio Railroad, gave the city greatly improved communication with the Atlantic seaboard.

Following the acquisition of Louisiana by the United States, St. Louis became a gateway for the exploration and settlement of the West. Soon new settlers from Kentucky, Virginia, and other Eastern states and from Europe began to arrive in increasing numbers. By 1819 the Irish in St. Louis were sufficiently numerous to organize a local Hibernian society. German immigration to the city began on a considerable scale in the 1830's. The failure of the revolutions of 1848 brought a wave of German immigration, and during 1848–1850, 34,418 German immigrants arrived in St. Louis. In 1850 one third of the population of St. Louis was of German birth. Following the Irish famine of 1848, Irish immigration greatly increased. The population of the city, which was 16,469 in 1840, rose to 77,860 in 1850, 160,773 in 1860, and 310,864 in 1870. This was the period of greatest immigration. In 1870 the population included 200,000 natives of the United States, 80,000 of whom had been born outside Missouri; and 112,000 persons of foreign birth, chiefly German and Irish, the former numbering 50,640, and the latter 32,291. Until the decade 1870–1880 the population of St. Louis was larger than that of Chicago.

Between the period of early American rule and the Civil War the foundations for most of the cultural institutions of the city were laid. The early settlers were chiefly members of the Roman Catholic Church, which provided instruction in elementary subjects for the children of the community almost from the outset. For a number of years such instruction was given in the French language. The first English-speaking school was opened in 1804. Subsequently various private schools were conducted in English as well as in French, and the community depended upon these for instruction until its first public school was opened in 1837, a local public school board having been organized in 1833. The first public high school was opened in 1853. An academy organized by the Rt. Rev. Louis William Du Bourg, bishop of Louisiana, in 1818 became in 1820 St. Louis College, French continuing as the medium of instruction until the reorganization of the college under the direction of the Jesuits in 1828, when English was substituted. In 1832 the institution was chartered as St. Louis University, the first university chartered west of the Mississippi. In 1853, Eliot Seminary was founded as a nonsectarian institution, which in 1857 was renamed Washington University. Until the early 19th century the only ecclesiastical organization in St. Louis was the Roman Catholic Church, which had played an active role in the life of the community almost from its founding. In 1817 the First Presbyterian Church was organized, and in 1818 a Baptist church. Soon other Protestant bodies were organized. In 1821 the town had five new brick church edifices. Although the community had long been the residence of a bishop, the Roman Catholic diocese of St. Louis was not created until 1826. In 1847 the diocese was made an archdiocese. The first local newspaper, the *Missouri Gazette,* was founded in 1808 by Joseph Charless, and in 1822 became the *Missouri Republican.* (It became the *Republic* in 1888 and was absorbed by the *Globe-Democrat* in 1919). In 1837 the St. Louis Theater was opened, and later various musical organizations were formed. In 1851 several concerts were given in the city by Jenny Lind. Local agricultural and mechanical fairs were introduced during this period, and in 1856 the St. Louis Fair was begun, being held annually thereafter, except during the Civil War, until the beginning of the 20th century.

Over the issues that led to the Civil War the people of St. Louis were sharply divided, but upon the outbreak of the war the vast majority strongly supported the Union. The city was the headquarters of the Department of Missouri, which was under the command of Maj. Gen. John C. Frémont from July 25 to Nov. 2, 1861, and of his successor, Maj. Gen. Henry W. Halleck, whose territorial command was extended and reorganized in March 1862 as the Department of the Mississippi. Throughout the war it served as a Federal base of operations in the Mississippi Valley region but was never the scene of battle.

Considerable numbers of troops were stationed in and near the city, which for several months was governed by martial law, and many prisoners of war were interned there. As the headquarters of the Western Sanitary Commission, St. Louis was the center of much war relief activity, and thousands of refugees were cared for locally. Through large orders for supplies placed by the Federal quartermaster department local industries developed on a new scale.

After the war the city continued to advance rapidly along many lines. Beginning about 1880 railway transportation gained steadily at the expense of river traffic. Along with the city's economic development, its importance as a manufacturing and distributing center increased. Its population rose from 310,864 in 1870 to 350,518 in 1880, and to 451,770 in 1890. Culturally also the city made marked progress during this period. For some years after the war it was the center of an intellectual and philosophical development known as the St. Louis movement, which was based chiefly upon the philosophy of Georg Wilhelm Friedrich Hegel. The movement was initiated by Henry Conrad Brokmeyer, a Prussian who first came to St. Louis in 1856 and subsequently inspired a local group to undertake a study of the Hegelian idealistic philosophy. Notable among the group was William Torrey Harris (q.v.), identified with the public school system of the city from 1857 to 1880, first as a teacher and later as city superintendent. In 1866 he and Brokmeyer organized the St. Louis Philosophical Society, with Brokmeyer as president, and in the following year the *Journal of Speculative Philosophy* was founded by the society, with Harris as editor, and with the motto: "Philosophy can bake no bread but it can give us God, Freedom, and Immortality." In the initial issues of the *Journal,* which continued until 1893, were published the first English translations of important works of Hegel, Johann Gottlieb Fichte, and Friedrich von Schelling. The movement exercised a considerable influence upon the cultural development of St. Louis and of the Middle West.

During the latter part of the 19th century there was an increasing interest on the part of the community in art and music, and various organizations were founded for their encouragement. A major contribution toward the development of art appreciation in the city was made by Halsey Cooley Ives, who came to St. Louis in 1874 and began a free evening class in drawing, which evolved by 1879 into the St. Louis Museum and School of Fine Arts and later developed into a department of Washington University. The St. Louis Art Society was organized in 1872, the Sketch Club in 1877, and the Artists' Guild in 1886. A building was provided in 1881 to house the university's art collection, and in 1887 Hercules L. Dousman added a wing to his residence to house his private collection of art, which he opened to the public on certain days. Gradually, however, the need for a city art museum was recognized, and the building erected for the art exhibit of the Louisiana Purchase Exposition was donated to the city by the directors of the exposition. In 1880 the St. Louis Symphony Orchestra was formed.

By 1900 St. Louis had become a rapidly advancing metropolis, with a population of 575,238. In 1904 the Louisiana Purchase Exposition (q.v.), was held in the city, with great success. By 1910 the population had risen to 687,029, and by 1920 to 772,897. Despite the economic depression which began in 1929, the progress of the city was steady thereafter. In 1930 the population was 821,960, and in 1950, 852,253. In 1923, 1934, 1935, and 1944, large bond issues were voted for public improvements. Industry grew rapidly, and its diversified character was readily adaptable to the production of a wide variety of war materials during World War II. Important work was done toward urban redevelopment in order to eliminate blighted districts and to provide additional housing facilities. The Illinois-Missouri Development Compact, ratified by the two states in 1949, authorized the formation of a bistate agency to coordinate the continued development of the St. Louis Metropolitan Area. See also FUR TRADE; LOUISIANA PURCHASE; MISSOURI.

HARRY M. PIPER, JR.

SAINT-LOUIS, West Africa, city and administrative capital of the French colony of Senegal. It is situated on a low, sandy island in the Senegal River, about 11 miles above its entrance into the Atlantic Ocean, and 162 miles by rail northeast of Dakar. Only the right channel of the river and a narrow tongue of sand dunes, about 500 feet wide at this point, separate it from the open sea. It is connected by bridges with villages on both sides of the river, and is served by modern means of communication. Steamers may proceed up the river to Podor, 140 miles distant, throughout the year, and as far as Kayes during the flood season, from July to October. The commerce of the city is chiefly with other centers along the river, and with Dakar, and metropolitan France. Among the principal buildings in St.-Louis are the colonial administrative building, the military barracks, a military hospital, a mosque, and a Roman Catholic Church. Public works have done much to improve the once unhealthful living conditions.

St.-Louis was founded in 1658 by a group of French merchant traders organized as the Compagnie Normande. It was seized by the British with the colony of Senegal in 1758, restored to the French in 1779, and again taken by the British in 1809. It was returned permanently to France in 1817. With the appointment in 1854 of Gen. Louis León César Faidherbe (q.v.) as governor general of the colony, there began the modern development of the city, which continued steadily thereafter. In 1948 the population was estimated at 51,000.

SAINT LOUIS, Fort, Ill., a crude enclosure built in the winter of 1682–1683 by René Robert Cavalier, Sieur de La Salle (q.v.) and his lieutenant, Henri de Tonty, for the protection of La Salle's projected Illinois colony. Erected on Starved Rock, which rises almost sheer for 125 feet from the south bank of the Illinois River not far from the present city of Ottawa, La Salle County, the fort was largely abandoned after Fort Pimitoui was built at what is now Peoria in 1691–1692, although it continued to be used occasionally by Tonty and others for several years. By 1699, however, it was entirely deserted and

later fell into ruins. The site is now included in Starved Rock State Park.

SAINT LOUIS, Fort, Texas, built by René Robert Cavalier, Sieur de La Salle, a few miles above the mouth of what he called the Lavaca River, now Garcitas Creek, after landing in 1685 with a group of French colonists on the shore of Matagorda Bay, which he believed to be the western mouth of the Mississippi River. The fort consisted of one large building and several smaller ones. From here La Salle, who soon discovered his false identification of the place, made several vain attempts to find the Mississippi and to reach Canada. Meanwhile the plight of the colonists grew steadily worse, their number being reduced by death and desertion from approximately 180 to 45 by January 1667, when La Salle set out with half the remainder in a final effort to reach Canada. Most of those left at the fort were killed by Indians early in 1689, and three months later the ruins of the settlement were discovered by a Spanish expedition, led by Alonso de León, sent in quest of La Salle. In the following year de León returned to the fort and burned the buildings.

SAINT LOUIS, Order of. See ORDERS AND DECORATIONS—*France.*

SAINT LOUIS PARK, village, Minnesota; a suburb of Minneapolis; served by the Chicago, Milwaukee, St. Paul and Pacific, the Minneapolis and St. Louis, the Great Northern, and the Minneapolis-Northfield, and Southern railways, and state highways. The village is mainly residential. Industries include the making of ice cream, tools, and dental supplies. Government is by a mayor and council. Pop. (1950) 22,644.

SAINT LOUIS-SAN FRANCISCO RAILWAY (popularly known as FRISCO). During the 1840's there was much discussion of the possibility of connecting the Mississippi River by rail to the Pacific coast, and in 1849 the Missouri Legislature granted a charter for the construction of the Pacific Railroad westward from St. Louis. Work was started July 4, 1851, and on December 9 of that year the first train operating west of the Mississippi River left St. Louis. Progress on the road was slow, and in 1853 only 33 miles of line were in operation. In 1852 the Southwest Branch was chartered, and in December 1860 it was running 75 miles from Pacific (formerly Franklin), Mo., to Rolla, Mo. This branch was taken over by the Southwest Pacific Railroad in August 1866; in 1877 its capital stock was transferred to the Atlantic and Pacific Railroad, which constructed additional mileage. In 1868 the Atlantic and Pacific itself was acquired by the South Pacific Railroad, which continued construction of the new line. Then ownership was retransferred to the Atlantic and Pacific Railroad. By 1872 service extended across the Missouri line into Oklahoma. On Sept. 10, 1876, the St. Louis and San Francisco Railway Company was incorporated and took over the property of the Atlantic and Pacific Railroad. In 1893 this company passed into receivership; it was reorganized as of July 1, 1896 as the St. Louis and San Francisco Railroad Company. Subsequent expansions extended the service into Alabama, Arkansas, Florida, Kansas, Mississippi, Missouri, Oklahoma, Tennessee, and Texas. Putting aside the initial aspiration to reach the west coast, the road developed its system as a purely Southwestern carrier. Purchase in 1901 of the Kansas City, Fort Scott and Memphis Railroad with its subsidiary, the Kansas City, Memphis and Birmingham line, gave the system entrance into Alabama, and subsequently the line was extended to Columbus, Miss., and thence to Kimbrough, Ala., and in 1928 to Pensacola. Fla. In 1913 the St. Louis and San Francisco Railroad Company went into receivership and emerged in 1916 as the St. Louis-San Francisco Railway. This new corporation lasted until 1932, when the road again went into receivership. Another reorganization of the company was effected Jan. 1, 1947, under the same name. In 1948 the road acquired the 214-mile Alabama, Tennessee & Northern Railroad Company, which opened to it the port of Mobile, Ala.

The road operates approximately 5,000,000 passenger miles per year. Among its better-known luxury passenger trains are the streamlined, Diesel-powered *Texas Special,* operating between St. Louis and San Antonio via Dallas and Fort Worth, and the *Meteor,* operating between St. Louis and Oklahoma City via Tulsa. Its freight service includes several trains which operate on near-passenger train schedules and give overnight and one-day service. The majority of its freight tonnage consists of iron and steel, agricultural products, petroleum, and minerals, which move through its main terminals at Birmingham and Mobile, Ala.; Fort Smith, Ark.; Pensacola, Fla.; Kansas City and St. Louis, Mo.; Oklahoma City and Tulsa, Okla.; Memphis, Tenn.; and Fort Worth and Dallas, Texas. Its major operational terminal is in Springfield, Mo. Through its Dieselization program the road had in service early in 1950 the following Diesel equipment: 108 1,500-horsepower road freight units, 6 2,000-horsepower passenger units, 14 2,250-horsepower units, 20 1,500-horsepower all-purpose units, 75 1,000-horsepower switching units, 2 660-horsepower switching units, and 8 44-ton switching units. Including the Alabama, Tennessee & Northern Railroad, the road operated over 5,138 miles in 1950.

CLARK HUNGERFORD,
President.

SAINT LOUIS UNIVERSITY, St. Louis, Mo., founded in 1818 as St. Louis Academy by the Rt. Rev. Louis William Du Bourg, bishop of Louisiana, became St. Louis College in 1820. During its first 10 years, it was a French-speaking school under the direction of the St. Louis diocesan clergy. In 1828 it passed to the jurisdiction of the Jesuit Fathers, who have operated it continuously since that time and as an English-speaking school. On Dec. 28, 1832, it was granted a university charter. Before 1850 it had established its Graduate (1832), Divinity (1834), Medicine (1836), and Law (1842) schools. As early as 1836, it had a department of fine arts. The School of Law was discontinued in 1847. The second half of the 19th century saw further retrenchments due in part to external causes. When the Know-Nothing Party (q.v.) swept the central states it was deemed advisable in 1855 to close the School of Medicine. The School of Divinity was discontinued in 1860.

The approach of the 20th century, however, saw a resurgence which has continued to the

present day. The School of Philosophy and Science was founded in 1889. The School of Divinity was reopened in 1899. In 1903, St. Louis University acquired the Marion-Sims-Beaumont College of Medicine, its present School of Medicine. In 1908, St. Louis Dental College became an integral part of the university. The School of Law was reopened in 1908. In 1910 the School of Commerce and Finance was founded. In 1925, St. Louis University became the first institution of higher learning in the world to establish a department of geophysics, which grew out of its geophysical laboratory, established in 1909. The corporate colleges of St. Louis University—Fontbonne, Maryville, Webster, St. Mary's Junior College, and Notre Dame Junior College—merged with the university in 1926. The School of Nursing, as such, was organized in 1928. The School of Social Service, established as the School of Sociology, assumed its present title in 1933, and in 1936 became a graduate school. In 1942, the Labor College was opened. The Institute of Social Sciences, a cooperative undertaking of all Jesuit institutions in the United States, was established at St. Louis University in 1944. Also in 1944 was established the Institute of Technology, and in 1946 the university obtained by gift Parks College of Aeronautical Technology, founded in 1927 as the first federally approved aviation school in the nation. The university radio station, WEW, which traces its broadcasting activities back to 1912, was the second station to be licensed in the United States and the first station in the world to be operated by a university.

St. Louis University operates the largest Roman Catholic medical center in the world, and is the second oldest Roman Catholic university in the United States, antedated only by Georgetown University (q.v.). Its faculty numbers 1,100. Enrollment for 1949–1950 totaled more than 9,300. Its graduates for the same period totaled 2,045, with 46 different kinds of degrees granted. Students of all races are admitted, and, though a Roman Catholic institution, the university is open to men and women of every creed. Of its 1949–1950 students, about one fourth were not of the Roman Catholic faith. The university's grounds, buildings, and equipment are valued (1950) at $10,000,000. Income for the 1948–1949 period amounted to $4,400,000 exclusive of gifts, which aggregated $300,000. The university is endowed to the amount of $3,000,000.

JOHN J. MCCARTHY,
Director of Public Information, St. Louis University.

SAINT LOUIS WORLD'S FAIR. See LOUISIANA PURCHASE EXPOSITION.

SAINT LUCIA, lū'shà, or lū-sē'à, the largest and most picturesque of the Windward Islands, British West Indies. It is situated at latitude 13°54′N., and longitude 60°59′W., 24 miles south of Martinique and 21 miles northeast of St. Vincent. The island is 27 miles long, 14 miles wide, and 233 square miles in area. The terrain is largely mountainous, the highest point, Mount Canaries, reaching 3,145 feet above sea level, and is covered with tropical vegetation and forest growths. There are fertile valleys, however, and approximately one third of the area is cultivated. Among the striking natural features are the twin peaks known as the Pitons, which rise abruptly from the sea just below Soufrière Bay, Gros Piton to a height of 2,619 feet and Petit Piton to 2,461 feet. Near Soufrière are boiling sulphur springs, from which the town derives its name. The climate is tropical. The chief towns are Castries, the capital, on the northwest coast, which has a fine landlocked harbor and a population of 15,000 (estimated 1949); and Soufrière, some 12 miles to the south. In 1948 four fifths of Castries was destroyed by fire; the British government made a grant for its rebuilding. There are 557 miles of roads, of which 200 miles are usable in all weathers.

The principal industry is agriculture, the staple crops being sugarcane, coconuts, limes, cacao, and bananas. Other products are vegetables, fruits, spices, honey, bay oil, bay rum, cotton, and wood. A variety of fish are caught for the local market.

The chief executive is the administrator, who is subordinate to the governor of the Windward Islands. He is assisted by a nominated Executive Council, and an 11-member Legislative Council, 3 of whose members are officials, 3 nominated, and 5 elected. In 1947–1948 there were 45 government-supported elementary schools, of which 39 were conducted by the Roman Catholic Church, 3 by the Anglicans, and 3 by the Methodists; their total enrollment was 10,997. In addition, there were 2 Roman Catholic and 2 private secondary schools. Three additional schools were under construction in 1949.

History.—The island was probably discovered by Christopher Columbus in 1502, and named in honor of St. Lucia. Later claimed by the French, it was settled by the English in 1639. In the following year, however, this colony was wiped out by the native Caribs. Thereafter St. Lucia was the scene of bitter conflicts between France and Great Britain, being held alternately by each nation at various times until 1803, when it became a permanent British possession. In the development of the island French influence has been strong. A French patois is still spoken to some extent, and most of the people are Roman Catholics. The population, estimated to number 81,143 in 1949, consists largely of Negroes. The white population is mostly of French creole origin.

In 1940 the United States leased from the British government several sites on the island for air and naval bases; that at Vieux Fort was returned to civilian control in 1949.

SAINT LUCIE INLET, Fla., at the southern end of the Indian River, is the eastern terminus of the St. Lucie Canal, which was laid out before 1860 in order to reduce the number of losses of vessels rounding Florida, which totaled 500 between 1848 and 1857. This canal is a link in the Cross-Florida Waterway and extends from Stuart on the Atlantic coast to Lake Okeechobee. Boats not exceeding a draft of 6 feet pass from the canal into the lake, from which they proceed by lock into Lake Hicpochee and then via the Caloosahatchee River into the Gulf of Mexico.

SAINT LUKE, Guilds of, associations of painters organized in medieval times under the patronage of St. Luke. The guilds flourished for many years in the Netherlands and admitted as members engravers, printers, and other groups.

SAINT-MALO, săn-mà-lō', France, in the Department of Ille-et-Vilaine, at the mouth of

the Rance, on the English Channel, occupies a rocky island, 47 miles northwest of Rennes. It is connected with the mainland by a causeway called Le Sillon. Ancient towered ramparts, with eight gates, surround the town. A castle, built in the 14th–15th centuries, is used as barracks. The harbor affords a total quayage of more than two miles.

Manufactures include hosiery, nets, sailcloth, and cordage. The Newfoundland cod fishery provides employment for many of the inhabitants. Cattle, fruit, and vegetables are exported, principally to Great Britain. François René de Chateaubriand was a native of Saint-Malo. Pop. (1946) 10,873.

SAINT MARC, săn-märk′, Haiti, town on Saint Marc's Bay, on the west coast, 44 miles northwest of Port-au-Prince. Near the town is a headland known as Crête à Pierrot, which was strongly fortified by English engineers and occupied by native soldiers in the war of independence, who here made a strong resistance against the French. It is the shipping port for a fertile valley, and exports chiefly coffee and logwood; the town also contains several distilleries. Pop. (1950) 10,485.

SAINT-MARC GIRARDIN, săn-märk′ zhē-rär-dăn′, **François Auguste** (originally, Marc Girardin), French politician and author: b. Paris, Feb. 22, 1801; d. Morsang-sur-Seine, April 1, 1873. He was educated at the Collège Napoléon and at the Collège Henri IV, and in 1828 commenced to contribute political articles to the *Journal des Débats.* In 1834 he was appointed professor of poetry at the Sorbonne, having exchanged it for that of history, held for a short time previously. Lectures which he gave at the Sorbonne were republished under the title *Cours de Littérature Dramatique* (1843–1863).

From 1835 to the revolution of 1848 he served as a member of the Chamber of Deputies. In 1844 he was elected to the French Academy. Other writings included *La Fontaine and the Fabulists* (1867); *Jean Jacques Rousseau, His Life and Works* (1875).

SAINT MARK'S CHURCH (San Marco). See Venice.

ST. MARK'S SCHOOL, a secondary boarding school for boys located in Southborough, Worcester County, Mass.; it was founded in 1865 by Joseph Burnett as a church school to conform with the principles and spirit of the Episcopal Church. Boys attend a short daily service in the school chapel, and a Sunday service at the parish church. The course of study aims at sound training in fields necessary for admission to colleges and scientific schools. There are six forms, corresponding to the 7th and 8th grades and the four years of high school. Boys are admitted in any of the five lower forms on the basis of test results and previous school records. A limited number of competitive scholarships are awarded annually. The school accommodates 190 boarding students and employs a faculty of 27, including a resident school physician. Older boys participate in the responsibility of running the school by serving on the student council and acting as monitors in charge of dormitories, study halls, and the work program. St. Mark's is incorporated not for profit, and is managed by the headmaster for a self-perpetuating board of trustees, of which the bishop of the diocese of Massachusetts is president. The land and buildings are valued at $550,000; there is an endowment in productive funds of approximately $1,500,000.

SAINT-MARTIN, săn-mär-tăn′, **Louis Claude de,** French mystic philosopher: b. Amboise, Jan. 18, 1743; d. Aunay, Oct. 23, 1803. While performing his military service he came under the influence of Martinez Pasqualis (1715?–1779), the Portuguese mystic, and expressed his views of that period in *Des erreurs et de la vérité* (1775), a work which the Roman Catholic Church placed upon the Index. Subsequently he traveled through Germany, England, Switzerland, and Italy, making converts to his own mystical philosophy, which was derived from a study of the works of Jakob Böhme (q.v.). He was styled "le philosophe inconnu." His followers, who called themselves Martinists, held that man on one side of his nature was a type of the Universe, a microcosm; on the other, the thought and reflection of God. By introspection, they held, all knowledge and wisdom could be reached. Other works included *L'homme de désir* (1790); *Le Nouvel Homme* (1792); *De l'esprit des choses* (1800). His *Oeuvres posthumes* appeared in 1807.

SAINT MARTIN, sânt mär′tĭn, island of the Lesser Antilles, northeast West Indies, east of Puerto Rico. The northern portion (area, 20 square miles; pop. 6,450) is part of the French overseas department of Guadeloupe; the northern portion (area, 13 square miles; pop. 1,609) is within the Netherlands Antilles. In the French portion, a foundation of old volcanic rocks has been partly overlaid with calcareous deposits, while in the Dutch portion volcanic rocks predominate. The highest point, 1,266 feet, is in the interior, on the boundary between the two sovereignties. There are sugarcane plantations, rum is manufactured, and salt obtained from the sea. Le Marigot is the capital of the French portion, and Philippsburg that of the Dutch portion. The island was settled in 1638 by the French and Dutch, but two years later they were driven out by the Spanish. In 1648 the French and Dutch regained possession and divided the island peaceably between them.

SAINT MARTIN'S DAY. See Martin I, Saint.

SAINT MARY HALL, Oxford University, originally was the parsonage of the rectors of Saint Mary's Church until it was presented by Edward II in 1326 to Oriel College. It then became a university hall and the office of principal was held by Oriel fellows down to 1656, from which time the chancellor exercised the right of nomination. In 1902 it was regularly incorporated with Oriel, in which its site, buildings, and property are now vested.

SAINT MARYLEBONE, mĕr′lĭ-bŏn, England, a metropolitan borough in the northwest of London, with an area of 1,473 acres. It is famous as the location of beautiful Regent's Park, which contains the Royal Botanical Gardens (18 acres) and the Zoological Gardens (34

acres), one of the largest zoos in the world. The Royal Academy of Music and the waxwork exhibition of Madame Tussaud (q.v.) are located on Marylebone Road, and the home of Elizabeth Barrett Browning (q.v.) was on Wimpole Street. Harley Street is the location of London's best-known surgeons, oculists, and dentists. Charles Dickens was living on Devonshire Terrace when he wrote *David Copperfield* (q.v.) and *Martin Chuzzlewit.* The district on Baker Street where it is recorded that fictional Sherlock Holmes lived was bombed out during World War II. Also, the famous parish chapel, Old Marylebone Church, where Elizabeth Barrett and Robert Browning were married, was greatly damaged during World War II.

SAINT MARYS, Maryland, the first settlement made in the state. In 1634 Gov. Leonard Calvert in his ship, the *Ark,* sailed up the Potomac to Saint Marys River, bought land of the Indians and established a settlement near the mouth of the Saint Marys. A Jesuit mission was established; many of the settlers, however, were Protestants and absolute liberty of worship prevailed. Though Saint Marys was the capital of Maryland and for a number of years the only town in the province, it was never more than a small settlement. In 1694, after Maryland became a royal colony, the capital was moved to Annapolis and Saint Marys fell into decay.

SAINT MARYS, city, Ohio, in Auglaize County, situated 22 miles southwest of Lima at an altitude of 926 feet; it is served by the New York Central and the New York, Chicago and Saint Louis railroads. It is in an agricultural region, and there are woolen mills, paper mills, and furniture plants. The city is supplied with natural gas. Settled in 1795, possibly by Charles Murry, a treaty was signed here on Sept. 17, 1818, between representatives of the Ottawa, Shawnee, and Wyandot Indian tribes and Lewis Cass and Duncan McArthur. Saint Marys was incorporated in 1820 and became a city in June 1903. Pop. (1950) 6,268.

SAINT MARYS, town, Ontario, Canada, in Perth County, on the Thames River, 100 miles southwest of Toronto, on the Canadian National and Canadian Pacific railways. Manufactures include cement, flour, dairy supplies, pins and small machinery, lumber, grist, and textiles. Stone for the cement is quarried here. Pop. (1951) 3,995.

SAINT MARYS, borough, Pennsylvania, in Elk County, 210 miles northwest of Harrisburg at an altitude of 1,670 feet; it is served by the Pennsylvania Railroad. Coal is mined in the neighborhood, and products of carbon, clay, leather, wood, electronic components, and electric lighting elements are made here. The borough was settled in 1842 by a group of Germans, and it was incorporated in 1848. Pop. (1940) 7,653; (1950) 7,846.

SAINT MARYS, a river between Lake Superior and Lake Huron, 40 miles in length. It is divided by large islands into two main channels, which each expand at intervals to a width of 10 miles. A fall of 22 feet in the river at Sault Sainte Marie, the twin cities of Michigan, United States, and Ontario, Canada, was formerly an obstruction to navigation. Two canals with large locks have been constructed, one on the United States side of Saint Marys Falls, and the other on the Canadian side. The United States canal was opened in June 1855. It is now 1½ miles long, 100 feet wide at the bottom, and 20 feet deep. Hay Lake Channel, adjoining Saint Marys River below the falls, has shortened, by 11 miles, the passage from Huron to Superior. Navigation is closed by ice part of the year.

SAINT MARY'S CHURCH, Cavalry Engagement at. In the American Civil War, after the battle of Trevilian Station (q.v.) cavalry divisions of the Confederates under Wade Hampton and Fitzhugh Lee kept close to the Union forces of Gen. Philip Henry Sheridan, which were covering the movement of a train of 900 wagons. On June 24, 1864, Sheridan sent the division of Gen. David McMurtrie Gregg and two batteries to Saint Mary's Church to cover his exposed flank, and there he was attacked by Hampton and Lee. After a stubborn contest Gregg was forced to give way. Sheridan declared that this was done in some confusion, although no material was lost, but Gregg, however, asserted that though the contest was unequal he retired without confusion or disorder. Nevertheless, Gregg left his dead and wounded on the field, and Hampton pursued him to within 2½ miles of Charles City Court House. The Union loss as reported was 29 killed, 188 wounded, and 122 missing. The loss in Hampton's division was 6 killed and 59 wounded. Lee's loss was not reported.

SAINT MARY'S COLLEGE, located at Saint Marys, Marion County, Ky. It was founded in 1821 by the pastor of the Catholic settlement as Saint Mary's Seminary; in 1833 the Jesuits took exclusive control, and the name was changed to Saint Mary's College; in 1837 the college was legally incorporated. A college farm was conducted, and all students were required to work one day every week on the farm. In 1846 the Jesuits abandoned the control of the college, and in 1847 it was transferred to the charge of the secular clergy of the diocese of Louisville. Financial difficulties resulted in its being closed from 1869 to 1871, and in the latter year it was reopened under the charge of the Fathers of the Congregation of the Resurrection, a teaching order, and was later recognized as the official Roman Catholic college of the diocese of Louisville.

SAINT MARY'S SEMINARY, and UNIVERSITY, a Roman Catholic institution in Baltimore, Md.; opened Oct. 30, 1791. From the first the seminary has been in charge of the Society of Saint Sulpice, an organization founded by Father Olier, in 1642, for preparing young men for the priesthood. On the site of the present institution, when the Fathers purchased the place, was the well-known "One Mile Tavern." There were only five students in the school during the first three years, and in 1806 only 12 students. However, the school continued its work. For a time Saint Mary's College, Baltimore, and Mount Saint Mary's College, Emmitsburg, Maryland, were affiliated with the seminary. The latter thereafter ceased to be

affiliated with the two colleges. After 1804 the seminary was raised to university rank by legislative act, and is accredited to present the doctor of philosophy and equivalent degrees in the arts and sciences and in theology. The school admits only men who wish to study for the priesthood, and has about 800 students.

SAINT MAURICE, sânt mô'rĭs, river, Quebec, Canada, 325 miles long, flowing southeast from the Gouin Reservoir into the St. Lawrence River at Trois Rivières.

SAINT MICHAEL, village, Alaska, on St. Michael's Island off the southeastern shore of Norton Sound, latitude 63° 29′ N., longitude 162° 1′ W. Founded in 1831 as a trading post of the Russian-American Company, the settlement was a supply center and point of transshipment for Yukon River steamers, but its importance has declined. Pop. (1950) 157.

SAINT MICHAEL'S COLLEGE, Vermont, a nonsectarian institution of higher education for men, located at Winooski Park, three miles northeast of Burlington. The college, privately controlled by the Society of St. Edmund of the Roman Catholic Church, was opened in 1904, and offers degrees of bachelor and master in the arts and sciences and in education. The student body is under 1,000. The college is noted for its summer theater, which cooperates with the Boston Repertory Theatre and the Burlington broadcasting station in conducting a drama workshop, and for Freshman Orientation Week, when a counseling team of a layman and a priest are assigned to every 30 men.

SAINT MICHAEL'S MOUNT, island, England, in Cornwall, about a mile in circumference, one fourth mile from the mainland. The islet, formed by an isolated rock of conical shape over 200 feet high, is a vast mass of granite protruding through schistose rock. An old castle and church stand upon its summit, and a fishing village with a projecting harbor lies at its base. A causeway, passable only at low tide, connects the island with the mainland. During the Middle Ages the mount was both a popular place of pilgrimage and a fortress. Edward the Confessor (r. 1043–1066) founded on it a Benedictine priory, which he donated to the Abbey of Mont-Saint-Michel in Normandy, France, under whose jurisdiction the mount remained intermittently until the dissolution of alien houses in the reign of Henry V. Under Henry VIII the island passed from religious to secular control. Its possession was disputed during the Lancastrian and Parliamentary wars, and after 1659 it became a manorial residence.

SAINT MICHEL (also called SAINT MICHEL DE LAVAL), city, Québec, Canada, located in Montreal Island, immediately north of the city of Montreal. St. Michel, which forms part of the metropolitan area of Montreal, lies near the center of the island, and is predominantly residential. Pop. (1941) 2,956; (1951) 10,539.

SAINT-MIHIEL, săn-mē-yĕl′, town and commune, France, in the Department of Meuse, in the northeastern section, famous for its Benedictine abbey. The town, founded by the Gauls, was called Châtillon until the 8th century, when it adopted its present name from the abbey. It had a parliament in the 14th century and was judicial center of Lorraine. In the 16th century a brilliant artistic school developed under the sculptor Ligier Richier, earning St.-Mihiel the name of "the Florence of Lorraine." Destroyed in 1635 by Louis XIII after determinedly resisting his armies, the town was restored with the help of St. Vincent de Paul. The many monuments in the town date mostly from the 17th and 18th centuries.

Held by the Germans during most of World War I, St. Mihiel was the center of the "St. Mihiel salient" which was reduced in a battle on Sept. 12 and 13, 1918. Gen. John J. Pershing planned the action as the first mainly American offensive of the war, although it was under the nominal direction of General Pétain, French commander-in-chief. In the Allied army were about 500,000 Americans and about 100,000 French. About 60,000 Germans commanded by General Fuchs held strongly fortified positions. The offensive was a complete success, with all objectives taken in two days, along with 16,000 prisoners. At the time, the *Infantry Journal* reported that the most intense concentration of artillery fire in history, more than 1,000,000 shells in four hours, had been employed. Outside of tactical and strategic considerations, the victory had some propaganda effect on the course of the war, since it was won by troops whom the enemy had derogated as inexperienced. Pop. commune (1954) 5,035.

SAINT MORITZ, sânt mô-rĭts′ (Ger. SANKT MORITZ; Romansh, SAN MUREZZAN), commune, Switzerland, health and mountain resort in Upper Engadine, canton of Graubünden, in the eastern part of the country. The commune consists of St. Moritz-Dorf (village, 6,080 feet), and St. Moritz-Bad (baths, 5,824 feet), where the chalybeate springs are located. The springs, known to the Romans, were recommended by Philippus Aureolus Paracelsus in 1537. St. Moritz is winter-sports capital of Switzerland. Pop. (1950) 2,558.

SAINT-NAZAIRE, săn-nà-zâr′, town and commune, France, in the Department of Loire-Inférieure, at the mouth of the Loire River, about 37 miles northwest of Nantes. The town is an important Atlantic seaport, maintaining trade with England, Spain, the two Americas, and West Africa. The well-equipped docks extend about three miles and can accommodate the largest vessels. St.-Nazaire is a major manufacturing and metallurgical center, and has large forges, foundries, refrigerating plants, and grain elevators. Before World War II the largest shipyards in France were located here. Thought to be located on the site of an old Gallo-Roman seaport named Corbilo, the town did not develop commercially until the later 19th century. During World War I the wharves were greatly enlarged to permit American and British forces to land. In 1940 during World War II the Germans turned the town into an important military and submarine base. It became the target for intensive Allied bombing and was completely destroyed before the German garrison surrendered in May 1945. By 1948 the shipyards were again in operation. Of special interest in the town is an ancient granite dolmen, 10 feet long resting horizontally on two stones seven feet from the ground. Pop. commune (1954) 39,350.

ST. OLAF COLLEGE. A coeducational college of arts and sciences located at Northfield, Minnesota, affiliated with the Evangelical Lutheran Church of America but privately controlled. College was founded in 1874 chiefly through the efforts of the Rev. Bernt Julius Muus, a prominent pioneer pastor in Goodhue and Rice counties, Minnesota. It was known as St. Olaf's School from 1874 to 1886 during which time its educational status was that of an academy. The college division was established in 1886 and its first class graduated in 1890. The academy division was discontinued in 1917 because of the rigid expansion of the college and the corresponding development of public secondary schools. From its origin to the present time it has been affiliated with or operated by the various Lutheran Church groups which now constitute the Evangelical Lutheran Church of America.

As a standard liberal arts college it aims to provide an academic training which is fully abreast of the best quality scholarship and to furnish the facilities for study, teaching, and research which will make possible an efficient and progressive academic life. As a college of the Lutheran Church, it is loyal to the beliefs and practices of this church. It seeks to train students for constructive service in many important fields of Christian activity within the church as well as in the world at large.

The College offers majors toward a bachelor of arts degree or a bachelor of music degree in twenty-three academic fields. It has established excellent pre-professional training programs in special areas as theology, medicine, law, and engineering. In 1948 its instructional staff numbered 123; its administrative staff 93. Its enrollment in 1948 is 1,708 students.

The College is accredited by the North Central Association of Colleges and Secondary Schools, the Association of American Universities, the American Association of University Women, and the American Chemical Society.

The Ole E. Rölvaag Library, named in honor of the college's distinguished author-son, has an ultimate stack capacity of 200,000 volumes. The library at the present time numbers about 73,893 volumes, including 6,000 volumes of bound periodicals. The Carnegie Corporation has given collections of books on music and art. The archives of the Norwegian-American Historical Association are located in this building.

In 1948 its endowments totaled $1,100,000.

SAINT OMER, săn-tô-mar′, France, a fortified city in the department Pas-de-Calais, 26 miles southeast of Calais, on the Aa River. It is situated on a marshy site, has two harbors and begins the canalized portion of the Aa. The Gothic cathedral is old and curious. It has fine portals (13th–14th centuries), good paintings, interesting statues and monuments, wood carvings and fine stained glass and mosaics. The other notable points of interest are the ruined tower and arches of the Benedictine Abbey of Saint Bertin and a museum. The Church of Saint Sepulchre is remarkable for its beautiful stone spire and stained glass windows. The town hall contains valuable records, a picture gallery and a theater. There is a large public library and extensive arsenal. Saint Omer manufactures tobacco pipes, cloth, hosiery, tulle, cambric and muslin embroideries. Its trade is in these articles and in paper, flour, sugar, beer and other liquors. During World War I it was for a time General Headquarters of the British Army in France. Pop. (1946) 18,373.

SAINT-OUEN, săn-twăn′, France, a suburb of Paris, in the Department of the Seine, about one mile southwest of Saint Denis, is an important manufacturing center and river-port, with spacious docks. The industrial establishments include foundries, forges, machine and glass works, sugar and sawmills and manufactories of rubber-goods, varnish, printer's ink, canned foods and firearms. Here on May 2, 1814, Louis XVIII signed a promise for a constitutional charter for France. Pop. (1946) 51,106.

SAINT OURS, săn-tōōrz′, Jean Baptiste de, Sieur D'Eschaillons, French-Canadian soldier: b. Canada, 1668; d. Montreal, 1747. His father, Pierre de Saint Ours, was the first of the family to come to Canada, and obtained extensive grants of land. The son entered the army at an early age and in 1702 was made lieutenant. He was one of the commanders of the expedition against Fort Orange (Albany) in 1708. He commanded a company in de Ramezay's expedition against the English in 1710, and in 1721 was sent on a special mission to several Indian tribes by the governor, De Vaudreuil. On this expedition Saint Ours endeavored to put a stop to the liquor traffic with the Miamis, and tried to bring about peace between the Sioux and their enemies; also induced the Creeks to form a single village. On his return he subsequently became king's lieutenant of Montreal.

SAINT PANCRAS, sânt păng′krăs, England, a metropolitan and Parliamentary borough of London, lying east and north of Regent's Park; area, 4.21 square miles. It is well supplied with open spaces, which include Parliament Hill and Primrose Hill. The railway terminals of Saint Pancras, King's Cross and Euston Square are within the borough. It returns four members to Parliament. Pop. (1945) 121,150.

SAINT PATRICK'S COLLEGE, a theological school in Maynooth, Ireland, popularly known as Maynooth College. It was founded in 1795 and the Gothic building was erected by a parliamentary grant obtained in 1846. The college is now affiliated with the National University of Ireland.

SAINT PAUL, the Apostle to the Gentiles. According to Acts 21:39 Paul was a native of Tarsus, the most important city of Cilicia. His parents were of pure Jewish descent, for he could boast that he was "of the stock of Israel, of the tribe of Benjamin, a Hebrew of the Hebrews" (Philippians 3:5). His father, however, was a Roman citizen. How he had acquired this privilege we are not told. It may have been purchased or obtained in some other way. Paul was content to say that *he* was free-born. Tarsus was a center of Greek culture and the son of a citizen of that town had ample opportunities to secure the best classical education the times afforded. To what extent Paul shared these advantages is not stated, but his words (Acts 22:3) appear to mean that at a comparatively early age he was sent to Jerusalem

to receive a *Jewish* rather than a Greek education. The social status of Paul's parents may have been high. There are good reasons for thinking that the family was wealthy. (Consult Ramsay, 'Saint Paul the Traveller,' etc., pp. 310 ff). However, this did not interfere with the good Jewish custom of teaching the boy a trade. That he learned to make tents was the more natural since the wool of the long-haired Cilician goats was extensively used for tent-cloth. It is probable that he learned his handicraft before he went to Jerusalem for his education.

Like other individuals with two names in the New Testament he was more familiarly known in Jewish circles by his Hebrew name, Saul. Paul was his Roman name, the cognomen given him probably by his father, for what reason we do not know. As his life work developed and he felt himself called to minister to the great Gentile world he preferred his Roman-Greek name to the Hebrew one.

The date of Paul's birth cannot be fixed with exactness. In his letter to Philemon (9), written probably about 60 A.D., he calls himself an elderly man (*πρεσβύτης*). This may be taken as signifying, approximately, one who has attained his 60th year. Probably he was born within a very few years of the beginning of the Christian era.

His personal appearance was not imposing. His opponents could easily admit that his letters were powerful and at the same time remark that "his bodily presence was weak and his speech contemptible" (2 Cor. x, 10). A very ancient tradition in Asia Minor speaks of him as "baldheaded, bow-legged, strongly built, a man small in size, with meeting eyebrows, a rather large nose, full of grace, for at times he looked like a man and at times he had the face of an angel." (Consult Ramsey, 'The Church and the Roman Empire,' ch. xvi). Behind such an unattractive exterior lay a physical nature capable of enduring the severest strains (see 2 Cor. xi, 23–28) and a soul endowed with most varied gifts in rich abundance.

To the young Jew of Tarsus the opportunity to study in Jerusalem at the feet of Gamaliel (Acts xxii, 3), one of the most learned rabbis of his day, was a privilege to be used to the utmost, no mere parent-imposed task. Proud of his Pharisaic ancestry and training the young man eagerly pursued his studies "advancing in Judaism beyond many" of his associates, "being more exceedingly zealous for the traditions" (Gal. i, 14). He studied the Old Testament and especially the Law not merely as the authorities for the national religion or for orthodox Pharisaic theology, but as the foundation and source of his personal religion. He was anxious to attain the righteousness demanded by the Law. So far as externals went he succeeded in doing this (Phil. iii, 6). But the more thoroughly he probed his religious experience the more hopeless his case seemed. The sentence of the Law became to his sensitive conscience the sentence of death (Rom. vii, 7–25).

It was while Paul was thus pursuing his studies in the rabbinic schools that Jesus the Messiah lived and died. Whether Paul was in Jerusalem on any of the occasions when Jesus visited the place, or whether he ever saw Jesus in the flesh is doubtful. (2 Cor. v, 16 does not necessarily imply this). However that may have been, Paul's opposition to Christianity did not begin with the first Christian preaching. Not until the early Church had become well started, when such a teacher as Stephen began to declare the merely temporal character of Jewish ordinances, was Paul's opposition aroused. We meet him first in the record of the martyrdom of Stephen at which the witnesses laid down their garments (Acts vii, 58, cf. Deut. xvii, 7) "at the feet of a young man named Saul, who was consenting to his death" (Acts vii, 58, viii, 1). Though too young to have been a member of the Sanhedrin (Acts xxvi, 10 does not mean this) he stood high in the favor of the Jewish authorities and was only too willing to take the lead in a general persecution of all Christians in Palestine and adjacent lands. After having caused the imprisonment of many in and about Jerusalem, some of whom were put to death, while others suffered great indignities (Acts xxvi, 10–11, xxii, 19, ix, 1, Gal. i, 23), he secured authority from the chief priests to proceed to Damascus and take action against any Christians he might find there (Acts ix, 1, xxii, 5, xxvi, 12).

But Paul was not to enter Damascus as a persecutor. As he and his party neared the city a sudden and most profound transformation took place. Paul had a vision, in which he saw Jesus the Nazarene and heard Him ask "Saul, Saul, why persecutest thou me?" (cf. Acts, ch. ix, xxii and xxvi, and also Gal. i, 15, 1 Cor. ix, 1, xv, 8). It was enough. Henceforth Paul's entire point of view was changed. God had "revealed His Son" in him. He had seen Jesus as *Lord*. It meant parting with all his past, though as yet he saw this only as to some main points. Above all, it revolutionized his idea of Jesus. That one had been to him only the justly crucified leader of a heretical movement. He was now and evermore the glorified Messiah. Accepted as a brother by the believers in Damascus, Paul soon began to proclaim Jesus as the Messiah to the Jews there. This only aroused their hostility and they plotted to get him in their possession. He succeeded in escaping (Acts ix, 25, 2 Cor. xi, 32) and made his way into Arabia (Gal. i, 17) where he stayed for upward of three years, not "conversing with flesh and blood," that is, not seeking light or instruction from those who had been Christians before him, but in meditation and communion with God, seeking to sound the depths of that great revelation that had been granted him. What struggles and conflicts he then went through, what changes of view on many details of his Jewish belief, what great revolutions of opinion, what new-found hopes and convictions he now experienced — we can see all these reflected in his later speeches and letters. Finally he was able to outline the main points involved in his new faith. That Jesus of Nazareth was and is the Son of God, that in His death forgiveness of sin is made possible, and that through faith in Him forgiveness and salvation are made a personal possession,— these formed the core of his gospel of the cross, a gospel that no man taught him, but which came to him from God (Gal. i, 11).

He was now ready to learn details about Jesus' earthly life and ministry. He, therefore, returned to Damascus and then visited Jerusalem especially to talk with Peter. Having gained what he desired from Peter and by his

preaching having aroused the opposition of his former associates in Judaism, he soon left Jerusalem and went into «Syria and Cilicia» (Gal. i, 21; cf. Acts ix, 30). After some years' labor in these regions, he was sought out by Barnabas and persuaded to join that good man in the work of building up the new church at Antioch, the metropolis of Syria. This church had almost from the first considered Gentiles as worthy to be approached directly with the Gospel message. In such an atmosphere Paul's own view of the Gospel as suited for man as man independent of his antecedents found room for full expression. After laboring here for a year Paul, with Barnabas, was delegated to carry an offering from the church at Antioch to the mother church at Jerusalem (Acts xi, 27–30, xii, 25). Since Paul makes no mention of this visit in his survey of his connection with the mother church in Galatians i and ii, it is probable that it was of no special importance to Paul personally. Returning to Antioch accompanied by John Mark of Jerusalem, Barnabas' cousin, it was soon decided to organize a mission to the adjacent lands. At a meeting of the church Barnabas and Paul were formally set apart to this work through prayer and laying on of hands (Acts xiii, 1–3).

Taking with them John Mark as assistant, the two set out on the First Missionary Journey (Acts xiii, 4–xiv, 28). Cyprus was first visited and traversed from end to end, then crossing the sea to the mainland they disembarked at Perga of Pamphylia. Here they decided to strike inland. For some reason Mark deserted them now and returned to Jerusalem. From Perga they proceeded to Antioch of Pisidia. At this important centre of trade the missionaries stopped. Paul delivered an address in the Jewish synagogue, in which he sought to convince them that Jesus was indeed the Messiah promised in the Scriptures. So great was the interest aroused that a second address was asked for the following Sabbath. At this meeting the majority in the synagogue refused to accept the message and the missionaries then turned their attention to the Gentiles. A Christian Church was soon organized in which naturally Gentiles and Jews met on equal terms. The work grew rapidly but the opposition of the Jews of the synagogue became so bitter that Paul and Barnabas thought it best to leave. From Antioch they proceeded eastward to Iconium, where they met with much the same experience. From Iconium they went on to Lystra and thence to Derbe. At Lystra, the home of the future disciple, Timothy, the healing of a cripple led the pagan multitude to think that the gods were again visiting the earth. All these towns were on a great commercial highway leading through southern Asia Minor from Asia to Europe and, though originally belonging to different nations, were then all included in the great province of Galatia. Consequently the churches founded on this journey may be those to whom the apostle addressed the Epistle to the Galatians (q.v.). From Derbe the missionaries retraced their steps and arriving at the coast sailed directly to Antioch without revisiting Cyprus. The journey, which probably covered about a year and a half, had been a complete success. It proved how the Gospel was capable of being applied to and understood by the pagan world.

Just at this time extremely conservative Jewish Christians from Jerusalem disturbed the peace of the Antioch Church by teaching, as the orthodox view, that Gentiles, in order to be saved, must not only profess faith in Jesus Christ and be baptized, but also be circumcised and obligate themselves to keep the Jewish law. What part Paul took in the discussion at Antioch we do not know, but so serious was the situation seen to be that the church decided to refer the matter to the apostolic body at Jerusalem and delegated Barnabas and Paul to represent them at the council so summoned.

The probable date of the Apostolic Council was 49 A.D. or possibly 48. If Paul counts the «fourteen years» of Gal. ii, 1 from his conversion, then that event took place somewhere near 35 A.D. If the 14 years is to be counted from his visit to Jerusalem to see Peter (Gal. i, 18) then his conversion must have been as early as about 32–33 A.D. The report of the council in Acts xv needs to be supplemented by Paul's own statements in Gal. ii, 1–10. The result was a victory for Paul, at least to this extent, that the mother church put itself on record as recognizing the legitimacy of the Gentile Christian movement and refused to order that Gentile Christians should be circumcised. To Paul himself was given full recognition of his Apostolic status.

Soon after their return to Antioch, Paul proposed to Barnabas that they revisit their churches in Galatia. Barnabas wished to take Mark. Paul would not consent to this since Mark had deserted them on the first journey. The contention was sharp and the two friends separated. Paul now set out with Silas (Silvanus) as his companion on his Second Missionary Journey (Acts xv, 40-xviii, 22, 49–51 A.D.). Entering Asia Minor through the Cilician gates, in due time they arrived at Derbe and Lystra. Here they were joined by Timothy, a choice young convert. After spending some time with the churches organized on the first journey, they moved on through Asia Minor, perhaps founding some new churches in Galatia (see GALATIANS, EPISTLE TO), and finally arrived at Troas, where, possibly, Paul met Luke. The «we» sections of Acts begin at this point (Acts xvi, 10). Here the night vision of a Macedonian man calling for help convinced Paul that the Gospel must be carried into Europe. Crossing over to Macedonia, at Philippi, at Thessalonica and at Berœa, all Macedonian towns, Paul succeeded in organizing churches. His method was essentially the same in all cases,— first to address the Jewish inhabitants at their synagogue or other meetings, and then, when hostility manifested itself, to withdraw his adherents from the synagogue and organize a church of the free Gentile Christian order. The discontented Jewish element followed him with dangerous persecution and it was to avoid falling into their hands that he left Berœa hastily and went on to Athens. Here apparently was an uninviting field. The city of philosophers and idlers was not thirsting for the Gospel of Paul. But in spite of misgivings he delivered his famous address on Mars Hill. Perhaps nowhere does Paul's versatility and breadth of view, his profound conception of the universal character of the Gos-

pel message show itself as it does here in this address. But Athens was not prepared for such a message and as soon as his helpers arrived from Macedonia with the report of the conditions there he sent Timothy back to Thessalonica (1 Thess. iii, 1), while he himself (with Silas, see Acts xvii, 15 and xviii, 5) pushed on to Corinth. Making the acquaintance of Aquila and Priscilla, Jews lately banished from Rome, he joined them in working at the tent-maker's trade. At first he had little success, but the arrival of Timothy from Macedonia with news of the devotion and constancy of the disciples there stirred him to new efforts (cf. 1 Cor. ii, 1 ff; 1 Thess. iii, 1–6; Acts xviii, 1–8). For a year and a half Paul was busy at Corinth. To organize and build up a Christian community in that large, gay, wicked, commercial metropolis was no easy task. It was while here that he wrote his two letters to the church of Thessalonica. The first one was occasioned by Timothy's arrival with good news and is full of words of commendation and hope. The second was written to counteract certain wrong views or inferences, mainly of statements in the first letter. These epistles, perhaps the earliest of the New Testament books, show us the Apostle's mind before the great doctrinal conflicts of the next few years had engaged his attention. The long stay in Corinth was perhaps shortened by the unsuccessful attempt of the Jews to have him tried by Gallio, the Roman pro-consul. Though this came to nothing Paul seems to have left Corinth soon after (fall of 51 A.D.) and crossing over to Ephesus with Aquila and Priscilla he hastened on to Antioch (Acts xviii, 18–22).

His stay in Antioch was not a long one. He soon found himself on his Third Missionary Journey (Acts xviii, 23–xxi, 17, fall of 51 to spring of 55 A.D.). Rapidly going through his old field in Galatia he arrived at Ephesus, then the great commercial emporium of Asia Minor. Here for nearly three years he made his headquarters. For Paul this was a period of most intense activity. Ephesus was a meeting place for all sorts of philosophical and religious speculations. As the patron city of the worship of the great goddess Artemis (Diana) whose temple outside the city walls was one of the wonders of the world, it was a stronghold of paganism and superstition. It was an open door, "but there were many adversaries" (1 Cor. xvi, 9). But it was not alone in Ephesus that "adversaries" were opposing the Apostle. In his old churches in Galatia and in Corinth enemies were sowing seeds of discord. The mischief-makers were members of the extreme Judaistic party, whose opposition to Paul's Gentile Christianity had necessitated the council at Jerusalem in 49 A.D. Only apparently defeated there they determined to carry the conflict into the churches founded by Paul himself. Their arguments were, mainly, that Paul was only a secondary apostle, not one of the original 12, that his gospel was, therefore, only one derived by false reasoning from the normal gospel of Judaistic Christianity, and that Paul's principles practically made the whole Old Testament, especially the Law, of no character or value whatsoever. Only too many in Paul's own churches were ready to listen to such teaching. From Galatia and from Corinth there came news to Ephesus of factious strife, of the adoption of Jewish customs and of growing hostility to himself on the part of those he had taught and trusted. But Paul, though bitterly disappointed and sorely tried, was equal to the emergency. In the Epistles to the Galatians and Corinthians he tried to deal with these vexatious and difficult problems. In them he successfully met the points raised by his assailants and, at least in the case of the church of Corinth, succeeded in winning the church back to himself. For the details of these matters readers are referred to special articles on these Epistles. During his sojourn at Ephesus "all Asia" (Acts xix, 10) had the advantage of Paul's missionary activity. Not long after the tumult caused by Demetrius the silversmith (xix, 23–41) he set out for Corinth, but, uncertain of the reception accorded to his first letter (1 Corinthians) and subsequent messages, he took the indirect route via Troas and Macedonia. In Macedonia Titus came from Corinth with most encouraging news (2 Cor. vii, 5–7) and Paul gladly pushed on to revisit the Corinthian church. He stayed at Corinth during the winter of 54–55 A.D. Before leaving Greece for his long contemplated visit to Jerusalem he penned his most comprehensive and important epistle, to the Christians of Rome, in which he set forth the great fundamentals of the Christian theology and thus prepared them for the visit he had in mind to make them. (See ROMANS). Paul now hastened to Jerusalem, not stopping at Ephesus, but saying farewell to a delegation from that church that met him at Miletus.

At Jerusalem he presented the mother church with the great collection he had been gathering for some time and was cordially received by James and other leading members, but advised to give evidence to the Jewish Christians that he himself still followed the ancestral mode of life according to the Law (Acts xxi). Paul was willing to do this, but it brought him into conflict with certain fanatics who accused him of defiling the temple. These were not Jewish Christians, but Jews of Asia who knew of his work in Ephesus and were bitterly opposed to him. A great uproar followed in which Paul was nearly killed, and only rescued by the prompt action of the Roman captain who commanded the garrison of the castle of Antonia overlooking the temple. Paul's attempt to explain his position to the Jews only enraged them the more and soon after, convinced that plots were being laid against Paul, Lysias the Roman captain sent him under a strong guard to Felix, the governor of Palestine at Cæsarea. Although Felix soon discovered that Paul was not guilty of any serious offense, he kept him bound in easy confinement, partly from mercenary motives, until his recall about two years later (that is, about 57 A.D.). Felix was succeeded by Porcius Festus before whom Paul cut the whole matter short by appealing to the emperor (Acts xxv–xxvi).

Paul was sent to Rome at the first opportunity (57 A.D.). With other prisoners he experienced shipwreck near Malta and was compelled to remain there all winter. In the spring the voyage was resumed and in due time they arrived at Rome. Paul's resolution and courage had commended him to the centurion in charge during

the voyage, and he was in consequence treated leniently. Friends met them some miles outside of Rome. In the city, while awaiting the emperor's pleasure concerning his case, Paul was permitted to live in his own hired lodging and have free intercourse with any who might desire to see him. One of his first acts in Rome was to call the leading Jews of the city together and set before them the principles of Christianity. The result was, as usual, that some believed him; others did not. Luke says (Acts 28:30–31) that this Roman captivity lasted two years (58–60 A.D.). If it had ended with his execution it would probably have been so stated. The natural inference is that he was released at the end of that period. It was during his Roman imprisonment that he wrote the *Epistles of the Captivity,* that is Ephesians, Colossians, Philemon and, probably as the last, Philippians. In these epistles the controversies that raged in Asia and filled his mind when writing to the Galatians and Corinthians are no longer prominent. His mind is full of the thought of the Church of Christ, and of the great divine personality who is its head. It is in these beautiful epistles, especially in Philemon and Philippians, that the heart of Paul is seen as nowhere else except perhaps in II Corinthians. Some details as to Paul's experience in Rome may be gathered from Philemon and Philippians, not sufficient, however, to make a complete outline.

After his release (61 A.D.) Paul appears to have undertaken another missionary journey, possibly to Spain (Rom. 15:24, also the tradition in Clem. Rom.). He afterward revisited the East and while there (according to what seems the most probable theory) wrote I Timothy and Titus. Again arrested he was brought to Rome for a second trial. Before this took place he wrote a letter to Timothy (II Timothy) beseeching him to come to him as soon as possible. It was probably about 64 or 65 that the great Apostle was executed by command of Nero. (The points in this paragraph have been stated on the theory that the Pastoral Epistles are genuine Pauline letters.)

It is hard to estimate adequately the significance of such a life. More than any other one Paul made Christianity the world-religion. No other man has so profoundly influenced the religious thinking of mankind. He was the greatest man of the Apostolic Age, if not of all ages of the church. Yet he was ever the disciple and Jesus the Master.

EDWARD E. NOURSE,
Late Professor of Biblical Theology, Hartford Theological Seminary.

SAINT PAUL, a remarkable island in the Indian Ocean, half way between Africa and Australia, and about 50 miles south of the island of Amsterdam. These islands are the exact antithesis of each other, St. Paul almost barren and Amsterdam covered with a dense vegetation. The island is two miles long, the highest point about 860 feet high and of volcanic origin. Goats, cats, rats and mice flourish, insect life is abundant, and sea-fowl in multitudes are characteristic. The island is a dependency of Madagascar.

SAINT PAUL, city, Minnesota, capital of the state and seat of Ramsey County, is located in the southeastern part of Minnesota on the Mississippi River at an altitude of 680–1,000 feet. It lies eight miles downstream from the head of navigation at the Falls of St. Anthony, and 396 miles northwest of Chicago by highway. St. Paul is a port city and a port of entry. Its area is 55½ square miles and it is contiguous with Minneapolis, the two municipalities being known as the Twin Cities. The Mississippi cuts through both cities, following a southeastward course past Fort Snelling and the confluence of the Minnesota River, and then striking north into St. Paul's business section, beyond which it again turns south.

The upper Mississippi at St. Paul, spanned by four bridges, is about 1,200 feet wide. Facing downstream, the greater part of the city is on the left; and along the left, or north, riverbank is a series of natural terraces. St. Paul's right riverbank is lined with high bluffs. The configuration of the land on which St. Paul has grown up does not permit everywhere of a formal arrangement of streets. However, broad modern boulevards have been developed for ease and rapidity in traversing the city, and most of its thoroughfares are tree-bordered. About 70 per cent of the city's families own their homes.

Transportation.—St. Paul is served by nine railroads: the Chicago, Burlington & Quincy; Chicago, Rock Island and Pacific; Chicago Great Western; Chicago, Milwaukee, St. Paul & Pacific; Chicago and North Western; Great Northern; Northern Pacific; Minneapolis & St. Louis; and the Minneapolis, St. Paul and Sault Ste. Marie. The Minnesota Transfer Railway Company, jointly owned and operated by these railroads, provides large freight yards for shipping services over all nine roads. The city is served by more than 100 motor carriers, and federal and state highways fan out in all directions. The Mississippi's channel at this point is nine feet in depth, and about 25 barge lines have operations at the port. St. Paul's municipal barge terminal is one of the largest on the upper Mississippi. The Minneapolis-St. Paul International Airport is jointly owned and operated by the twin cities and is served by several commercial airlines with scheduled service.

Business and Industry.—Minnesota provides many of the raw materials consumed by the city's manufacturing plants, and the surrounding agricultural area is an excellent market for many of the city's manufactured products. St. Paul's trade area, however, includes five other states. There are about 600 wholesale and 3,900 retail concerns within the city. Meat packing is a leading industry of Greater St. Paul, the South St. Paul (q.v.) market ranking second in the United States both in saleable livestock receipts and in cattle, calf, and hog slaughter. St. Paul's manu-

facturing and processing plants, which total more than 900, produce refrigerators, heavy hoist equipment, adhesives, abrasives, roofing granules, storage batteries, glass, wood and paper products, sportswear, canned goods, preserves, and other commodities. In the city are railroad and machine shops, foundries, and a large automobile assembly plant. Printing and publishing are also important in the city's economy, and St. Paul contains the largest law book publishing concern and is the nation's largest producer of advertising specialties. The processing of furs for the market and the manufacture of leather goods are St. Paul's oldest established industries. St. Paul has 19 banks and their clearings in 1950 totaled about $5,185,000,000.

Educational, Cultural, and Recreational Facilities.—The educational facilities of the city include public, private, and parochial elementary schools, in addition to a number of private day and boarding institutions, both denominational and nondenominational. There are special facilities for the education of deaf and otherwise handicapped children. Bethel Institute (Baptist, coeducational), besides being a two-year junior college, includes a three-year theological seminary. Other seminaries are Luther Theological (Evangelical Lutheran, for men) and St. Paul (Roman Catholic). The St. Paul College of Law, a private institution accredited by the American Bar Association, conducts a four-year evening course in law. The University of Minnesota maintains its department of agriculture on a 465-acre campus in St. Paul where the School of Agriculture and the College of Agriculture offer, respectively, three- and four-year courses. St. Paul School of Art provides training in painting, sculpture, and design. For the liberal arts, St. Paul has the College of St. Catherine (Catholic, for women), the College of St. Thomas (Catholic, for men), Macalester College (Presbyterian, coeducational), Concordia (Lutheran, for men), and Hamline University (Methodist, coeducational). The city maintains a public library system with a collection of around 500,000 volumes. Its James Jerome Hill Reference Library is considered outstanding, and its collections, totalling 160,000 volumes, are especially strong in architecture, decoration and design, Oriental art, economics, the natural sciences, psychology, sociology, and technology. Among special libraries are the collections of the Minnesota Historical Society which include manuscripts, books, newspapers, war records, and other materials. The Ramsey County Medical Society Library contains a valuable collection of medical Americana. The public library also exhibits a collection of cuneiform tablets, and the Minnesota Historical Society Building contains a museum which displays furniture and other relics of the state's pioneer period. St. Paul Seminary has a collection of furniture and other relics of the early Catholic priests and missionaries; and the St. Paul Institute, a municipal museum, contains exhibits of the sciences and applied arts. The city maintains a zoo, and also a conservatory which includes an unusually fine collection of tropical plants.

The St. Paul Civic Opera Association presents each year light opera and operettas for which local talent is largely used although, occasionally, internationally famous stars are imported. In cooperation with other groups, the association also presents summer concerts at popular prices. The Shubert Club presents a concert series during the winter with internationally famous artists. Through the club's scholarships and programs, it encourages local talent in musical composition and performance. Folk art programs, handicraft exhibits, and the periodic Festival of Nations are promoted by the St. Paul International Institute to help conserve the nation's cultural heritage and encourage better understanding between St. Paul's native and foreign-born people.

The people of St. Paul are predominantly Catholic, but 28 denominations are represented among the city's 248 churches of which 19 are classified as nondenominational. St. Paul is a seat of a Catholic archdiocese.

In addition to entertainment provided by moving picture theaters, night clubs, and other commercial enterprises, the Women's Institute of St. Paul provides programs of interest to the world of women. The St. Paul Figure Skating Club stages ice shows throughout the year, and "Pop concerts." The St. Paul Winter Carnival is an annual event for which a large ice palace is built, a pageant presented, and the whole city more or less gives itself over to the carnival and winter sports. On the Keller Municipal Golf Course, the St. Paul Open Golf Tournament is held annually. St. Paul is the location of Minnesota's important state fair. Among the buildings on the State Fair Grounds is an amphitheater in which an annual horse show, livestock show, and other events take place, but which is converted in winter into a natural skating rink.

St. Paul has numerous public playgrounds and parks covering a total of 3,000 acres. The parks have facilities for such activities as golf, tennis, ball games, skiing, canoeing, and swimming. Highland Park contains an athletic stadium seating more than 10,000 people. One of the two lakes within the city limits is in Como Park, and in winter Como Lake affords the city its largest outdoor skating rink. In this park are a statue of the German poet Schiller (a gift to the city by St. Paul's people of German birth); a bronze bust of Henrik Ibsen by Jacob H. G. Fjelde (1859–1896) who modeled it in Norway from life; and a statue of St. Francis of Assisi by Donald Shepard. Paul Manship, who was born in St. Paul and achieved national fame as a sculptor, is represented by his fountain group, *Indian Hunter,* in Cochran Park, and *Spring Awakening* in St. Paul Institute. Other interesting examples of sculptural work are six marble figures by Daniel C. French, above the central loggia of the state capitol, representing civic virtues; and the gilded copper chariot and driver representing Prosperity, designed by French and Edward C. Potter near the base of the capitol dome. A bronze statue of Martin Luther, a replica of one in Worms, stands on the Concordia College campus. In a public square is *Nathan Hale,* a statue by William Ordway Partridge. The Peace Memorial Statue in St. Paul City Hall and Ramsey County Courthouse building, designed by the Swedish sculptor Carl Milles, is of white onyx and is said to contain the largest carved onyx figure in the world. On its eight-foot base crouch five Indians at their council fire, smoking pipes of peace. From the smoke rises a 36-foot figure of an Indian god of peace, who holds a peace pipe in one hand while the other is outstretched in friendliness. The statue expresses the idea in symbolism that out of conference and understanding come the hope of world peace.

Buildings.—There are numerous buildings in

St. Paul justly entitled to recognition for the excellence of their architectural design. The Minnesota State Capitol is a beautiful and harmonious structure in an adaptation of the High Italian Renaissance. Its marble dome is patterned after that of Michelangelo on St. Peter's Basilica in Rome. The building was designed by Cass Gilbert, who received his early education in St. Paul and whose practice was located in the city when, as a young man, his design was selected for Minnesota's capitol. The Cathedral of St. Paul, containing 10 chapels, was designed by E. L. Masqueray and dedicated in 1916. It bears a general resemblance to St. Peter's Basilica. Its altar and baldachin in the sanctuary were designed by Whitney Warren, and surrounding the sanctuary itself are some unusually fine bronze grilles between the marble columns and arches. Among the newer ecclesiastical edifices is St. James Lutheran Church designed in modern clerestory style by Frank A. Abrahamson, a St. Paul architect. In the façade is a 17-foot sculptured figure of Jesus Christ, designed by Louis Kirchner and carved by Egisto Bertozzi from two blocks of Kasota stone. The Old Customs House, in modified Romanesque design, the erection of which was begun in 1867, is representative of the city's older public buildings. One of the show places of the late 1880's was the 32-room red brick residence of James J. Hill (now occupied by the St. Paul Diocesan Teachers College) in the neighborhood of which other families of wealth built their homes. Architecturally, little remains of the "old" St. Paul, however. The city's skyline is dominated by the 32-story setback skyscraper of the First National Bank. St. Paul's modern style Municipal Auditorium was built in 1907 and enlarged in 1932. It contains a theater with a seating capacity of about 2,800 and an arena accommodating 15,000 people, and is so adaptable that a number of different activities may be carried on at the same time by assemblages of various size. The Women's City Club, which also contains an auditorium, was designed in modern style by Magnus Jemne of St. Paul and some of its interior decorations, furnishings, and lighting are ultramodern. The 19-story St. Paul City Hall and Ramsey County Courthouse is so designed that 80 per cent of it is usable. Its lobby, which is 41 feet high, is so lighted as to give the illusion of limitless height. At one end is the Peace Memorial Statue already referred to. The Federal Building is another of the modern public structures that is functional in design. Functional design is also seen in many of the city's newer industrial structures.

Government.—The city has a commission form of government. The mayor, the six councilmen, and the controller, all of whom constitute the commission, are elected on nonpartisan tickets for two-year terms. Each councilman heads a department. The controller makes up the budget and the council reviews it. The council may increase or cut any item by not more than 10 per cent, although the total cannot be changed by more than 3 per cent. The public education system is administered by an elective school board, but the finances are controlled by the council and controller. The city operates under a home rule charter which can be amended only by a vote of three fifths of the city electorate.

History.—After the Louisiana Purchase, expeditions were sent out by the federal government to explore the new lands. Lieut. Zebulon M. Pike (q.v.) commanded one of these in 1805, and bought from the Indians acreage around the confluence of the Mississippi and Minnesota rivers for the establishment of a military post. In 1817, a site was selected for a fort which Col. Henry Leavenworth (q.v.) was ordered to build two years later. First called Fort Peter's, then Fort Colewater, the post was finally renamed Fort Snelling by Gen. Winfield Scott, in honor of the commandant, Col. Josiah Snelling; and Fort Snelling it remains. In the 1830's squatters settled on the reservation lands, among whom was a French Canadian trader, Pierre Parrant, nicknamed Pig's Eye. In 1840, they were expelled from the reservation. Parrant settled at the landing near Fort Snelling which steamboats had made their Mississippi terminus since 1823. This landing place, to which others were quickly drawn after the area was thrown open to settlement, became known as Pig's Eye. Father Lucian Galtier built a log-cabin chapel there which he dedicated in 1841 to St. Paul, and later prevailed upon the settlers to adopt that more dignified name for their community. Five years later the town of St. Paul was platted, a school was opened; steamboats began regular service, bringing up the river settlers and goods for trade; and St. Paul was the headquarters for the important American Fur Company. In 1849, it could boast at least one hotel, a newspaper, and a population of 840. It was incorporated that year as a town; but, even more important, the first legislature of the Territory of Minnesota met there, and St. Paul was thus made the capital and retained that place when Minnesota became a state. In 1853 the first bank in the whole region was opened there, and the following year St. Paul was chartered as a city. Traders and pioneers from the surrounding areas made it their trade center. Permanent residents were arriving at such a rate that carpenters and masons were hard put to it to supply the demand for dwellings and stores. By 1860, the population numbered 10,401, and horsedrawn stages carried goods and people in all directions. Two years later the first railroad reached the city, and St. Paul's scope of transportation and commerce began to broaden still farther. In 1880, 41,473 people resided in St. Paul, but during that decade population almost trebled, and improvements kept pace. Formerly separated from its twin city, the legal limits of St. Paul were extended to the Minneapolis line in 1884. In 1888, the St. Paul Union Stockyards were established by the railroads and St. Paul businessmen at South St. Paul, where it was customary to water livestock en route to Chicago. Up to about 1890, the city's economy depended very largely on trade and transportation; but, slowly around 1890, more manufactures began to be developed, and the city also took a more important place as an educational and cultural center. In 1914, the city adopted its present form of government.

Population.—Much of the character of the present city is attributed to the Germans and Irish who made up a large part of its early population. With the development of manufacturing many new strains were added and about 40,000 in St. Paul's foreign-born population come from 43 countries. The following figures represent the growth of total population in the present century: (1900) 163,065; (1910) 214,744; (1920) 234,698; (1930) 271,606; (1940) 287,736; (1950) 311,349.

SAINT PAUL, town, Nebraska, county seat

of Howard County; at the fork of the North and Middle Loup rivers; alt. 1,815 feet; on the Union Pacific, and Chicago, Burlington and Quincy railroads. A market town and shipping center for agricultural produce, it was founded in 1871 by a surveyor, James N. Paul, and was originally called Athens. As the state had another Athens it was renamed St. Paul at the suggestion of Sen. Phineas W. Hitchcock. Many Danes and some Swedes were among the early settlers. By 1950 there were more Danes in Howard County than in any other part of the state except Omaha. Pop. (1950) 1,676.

SAINT-PAUL, town, Réunion Island, on the northwest coast, south of Port-des-Galets. It has rail connections with the capital, Saint-Denis. The first French settlement on Réunion (then called Bourbon) in the 17th century, it was the early capital. Pop. (1946) 25,959.

SAINT PAUL ISLAND, largest of the Pribilof Islands (q.v.) of the United States, in the Bering Sea some 200 miles north of the Aleutians. It is about 35 square miles in area and has some 200 inhabitants. See SEALS AND SEALING.

SAINT PAUL SEMINARY, The, a Roman Catholic theological institution founded at Saint Paul, Minn., in 1890. Buildings, and an endowment, all totaling $500,000, were given by James J. Hill (q.v.); and the institution became the provincial seminary of the ecclesiastical province of Saint Paul. The seminary was opened in 1894. The archbishop of St. Paul is president of the board of trustees. The seminary has courses in theology and in philosophy; and three departments of instruction, theology, philosophy, and arts; the courses in the department of philosophy include mental philosophy, psychology, history of philosophy and biology; the courses in the department of arts include Hebrew, Greek, Latin, modern languages, and music, and form a part of the philosophical course; the study of Hebrew is optional. The seminary has a campus of 40 acres, the land sloping gradually toward the Mississippi; the buildings include the administration building, the class building, three residence halls, a dining hall, a gymnasium and the chapel. The library contains over 30,000 volumes, the students number about 186 and the faculty 13.

SAINT PAUL'S CATHEDRAL, one of London's most striking architectural features, is situated on Ludgate Hill, a site once used for pagan worship. The first Christian church was built there, according to the Venerable Bebe, by Ethelbert of Kent (552?–616). Although this original building may have been destroyed in later years of restored paganism, a church was apparently in nearly continuous existence on the site until one was burned down in 1087, to be succeeded by "Old St. Paul's," one of the largest churches in Europe. The London fire of 1666 destroyed this church and Christopher Wren, after being first instructed to rebuild the burned cathedral, was finally allowed to design a new one, although it was insisted that this resemble the old to some degree. Wren's plan was approved by Charles II and, between 1675 and 1710, the present cathedral was built, being a compromise between the medieval plan of the former building and the classical or Italian style. A great dome, topped with a cross, surmounts the building. St. Paul's contains many tombs of famous Englishmen, notably those of Nelson, Wellington, Wren, and Joshua Reynolds. During the bombing of London in World War II, especially on the nights of Dec. 29-30, 1940 and April 16-17, 1941, St. Paul's suffered considerably, while the area around it was devastated. The altar was destroyed, besides damage to the north transept and to the general exterior. Nevertheless, St. Paul's has remained a fine specimen of architecture, for which it owes as little to foreign influence as any in England, and one inseparably associated with the history of London. See also LONDON—*Church Buildings.*

ST. PAUL'S SCHOOL, a boys' boarding school two miles from Concord, N. H. Founded in 1855, it has an enrollment of about 440 boys, a faculty of approximately 55. It is an Episcopal Church school, with the chapel as the center of training in Christian worship and fellowship. Its members are of various religious denominations, but all worship in the chapel, and all boys receive regular religious instruction. The school is divided into six forms, or years. The boys' ages run from twelve in the first form to eighteen in the sixth. The first two forms, and the youngest group in the third, live in the lower school, the rest in groups of twenty or thirty in small dormitories, except the sixth form, which has a large building to itself. Each of these three sections has its own dining room. All dormitories are in charge of masters, aided by selected sixth form boys. In every form, boys of marked ability are placed in advanced divisions which progress faster than the regular divisions; conversely, there are slow-moving divisions for those who need more time to master a subject. The average size of a division is between twelve and thirteen. Every boy is a member of one of the athletic clubs. Since numerous teams exist in each club, most of the boys engage in regular athletics. Occasional games are also played with other schools, but sports are mostly intramural.

SAINT PAUL'S SCHOOL, London, England, an endowed grammar school, founded by John Colet c. 1509, with no limitations as to country, nation or class. It was built to accommodate 153 students and until 1884 stood in Saint Paul's churchyard. It was instituted for the free education of poor children. The original building was burned down in 1666. In 1824, the second one, built by Wren, was taken down and another erected. In 1884 a new school was opened at West Kensington. The course of study was formerly classical, but is now designed to prepare for army examinations. It is interesting to note that Major André, Camden, Halley, Milton, Pepys, Judge Jeffreys, the Duke of Marlborough and Sir Philip Francis were students here.

SAINT PETER, one of the twelve apostles of Jesus Christ (Matthew 10:2). He had been named Simon, but Christ predicted that he would be called Kēphā'—Rock—(John 1:42); the prediction was fulfilled when the Savior conferred this name on him (Matthew 16:18). Peter is the anglicized form of πέτρος, rock, the Greek equivalent of Kēphā'. πέτρος was probably chosen rather than πέτρα which would have been the more accurate translation, because the feminine gender of the latter would hardly have made it suitable for a man's name. In the New Testament, the apostle is called Simon (Mark 1:29);

Peter (Matthew 8:14); Simon Peter (John 21:2), and Cephas (Galatians 2:11). The last is the name most frequently used by St. Paul.

Peter came from the town of Bethsaida in Galilee (John 1:44); later, he set up his home in Capharnaum (Matthew 8:5-14). He was the brother of Andrew, who was also an apostle of Christ (Matthew 10:2). Peter and Andrew were fishermen, exercising their trade on the Sea of Galilee (Matthew 4:18). There is no reason to think that this occupation did not give them a good living; in fact, Peter considered that he had given up much to follow Christ (Mark 10:28). Although he and the apostle John were considered by the Sanhedrin "unlearned and untrained men" (Acts 4:13), that judgment would not have to mean anything more than that they were not skilled in rabbinical science, as were the men before whom they were on trial.

Peter was called three times by Christ to belong to his company; the first call (John 1:40-42), which could hardly be called anything more than a prophecy of future apostleship, was not immediately followed by a permanent association of Peter and Christ, for on the occasion of the second call, Peter was fishing with his brother at the Sea of Galilee, and was met there by the Lord, who invited the two brothers to follow him; a call which they obeyed (Matthew 4:18-20). Some time after this, Christ, after a night of prayer, chose twelve of his disciples to be his chief and closest associates who were henceforth called his apostles; Peter was one of these (Luke 6:12-16). This incident is narrated also in Matthew 10:1-4 and Mark 3:13-19; in all three accounts Peter is named first of the twelve apostles, although the order of the other names is different in each account. The list of the apostles in Acts 1:13 also puts Peter first.

Three of these twelve apostles—Peter and the two sons of Zebedee, John and James—were particularly close to their Master, being chosen to be witnesses of the raising of the daughter of Jairus (Mark 5:37); of the Transfiguration (Matthew 17:1); and of the agony in Gethsemane (Mark 14:33). As in the lists of the apostles, so in these accounts, Peter is always mentioned first.

In Matthew 16:18 there is found the fulfillment of the prophecy of John 1:42: Peter confessed that Jesus was "the Christ, the Son of the living God," and received from the Lord the new name Kēphā', Peter, and the promise which made the name significant: "Thou art Peter (Rock), and upon this rock I will build my Church."

Peter's concern for the welfare of Christ led him, shortly after this, to protest when Jesus predicted his passion and death; for this too-human advice he received a sharp rebuke from the Lord (Matthew 16:23).

Peter is mentioned comparatively often in the account of the Lord's passion and death. It was he who, with John, made the preparations for the Last Supper (Luke 22:8); at the supper, he protested against Christ's humbling himself by washing his feet, but allowed it when Jesus told him that unless he was washed, he would have no part with his Master (John 13:6-9). During the supper, Peter received from Christ the assurance that recalls Matthew 16:18: "Simon, Simon, behold Satan hath asked and obtained *you* (i.e., all the apostles) in order to sift *you* as wheat; but I have prayed for *thee* that thy faith fail not; and when once thou hast turned again, do thou establish thy brethren" (Luke 22:31 following). When Christ declared that on that night Peter would deny him, the apostle protested vehemently, saying that he would die rather than do so (Matthew 26:34 following). He witnessed the agony in the garden, and after Christ's capture was present with John in the courtyard of the high priest, while Jesus was being questioned (John 18:15 following). It was at this time that he was led, through cowardice, to deny three times that he knew his Master; after his sin he was at once repentant, and left the courtyard and wept bitterly (Luke 22:56-62).

On the morning of Christ's resurrection, Peter and John went to the tomb and found it empty (John 20:3-10). Later on that day, Christ appeared to Peter; he was the first of the apostles to see the risen Lord (Luke 24:34; 1 Cor. 15:5). Between the time of the resurrection and the ascension into heaven, Christ drew from Peter a three-fold confession of love, and confirmed him in his position as shepherd of the Savior's flock, prophesying at the same time that he would suffer martyrdom (John 21:15-19).

The first twelve chapters of the Acts of the Apostles show Peter taking the place of chief importance in the church. Before the Pentecost, he announced to the one hundred and twenty disciples that some one must be chosen to take Judas' place in the apostolic college (Acts 1:15 following); after the descent of the Holy Spirit on Pentecost it was he who preached to the amazed Jews the sermon after which about three thousand of them were baptized (Acts 2:14-41). He cured the lame beggar (Acts 3:6); an incident which led to his arrest and that of John who was with him (Acts 4:3). He pronounced judgment against Ananias, who had come to lay at the feet of the apostles part of the price of his property, holding back some while pretending that he was giving the whole (Acts 5:1-4); he and John went to Samaria to impose hands on those whom Philip the deacon had baptized, in order that they might receive the Holy Spirit (Acts 8:14-17). Three years after Saint Paul's conversion, the Apostle of the Gentiles made a visit to Jerusalem for the purpose of consulting Peter, and remained with him fifteen days (Galatians 1:18).

Peter's baptizing of Cornelius the centurion (Acts 10) was an event of greatest importance in the early church. Cornelius was a man "who feared God," that is, he was a pagan who had renounced idolatry and kept the seven precepts which the Jewish tradition considered to have been given by God to Adam and Noah, and so to be binding on all men. It must be observed that such a person was not a Jewish proselyte at all; specifically, among other things, he was not bound to the laws of legal purity as all real proselytes, as well as native-born Jews, were. At Cornelius' invitation Peter visited him, and baptized him without Cornelius' first being circumcised. Such a mode of conduct was against Jewish-Christian norms. When Peter was taken to task for what he had done, he made known to his critics that a vision, given to him at Joppa before he had met Cornelius had shown him that God took no account of the prescriptions prohibiting the association of Jews with the legally unclean (Acts 11:1-18). Although Peter's own mission was to be among Christians who were Jews by birth (Galatians 2:7), his action on this occasion marked the beginning of that definite break with Jewish observances which many of

the Jewish Christians wished to keep in force.

Shortly after this, Peter was imprisoned by Herod Agrippa I; from this imprisonment he was miraculously delivered (Acts 12). Since it is known that this king died in 44 A.D., the year of his death is one of the fixed points for the chronology of the early church.

After the twelfth chapter of the Acts, Saint Luke, the author, turned his attention principally to Saint Paul, and from that point on, we have only incidental information about Peter. A few points of his later life are known also from the Pauline epistles. At the Council of Jerusalem, held around 49 A.D., Peter and James were the apostles who took leading parts (Acts 15). That council decided against the necessity of circumcision for the Gentile converts to the church—a decision in conformity with Peter's earlier conduct in the case of Cornelius. Later than this, at Antioch, Peter was induced because of fear of the Jewish Christians from Jerusalem to hold himself aloof from the uncircumcised Christian converts—a manner of acting which was in contradiction with his own principles and previous action, and one which earned him a public rebuke from St. Paul (Galatians 2:11-14). Paul's concern with the effect of Peter's conduct on others shows the influence that Peter must have had; since it was not Peter alone who acted in this way, and yet Peter alone received Paul's correction. Tradition makes Peter the first bishop of the church at Antioch. Most probably he was in Corinth (I Cor. 1, 12). He was the author of two epistles, each explicitly ascribed to him (I Peter 1:1; II Peter 1:1). The first was written from Babylon, which most exegetes take to be Rome (I Peter 5:13).

That Peter suffered martyrdom at Rome is a tradition which was universal in the Christian world by the end of the 2d century. The tradition has been vigorously attacked since the time of the Protestant Reformation, but it is now again generally accepted; of the doubts entertained against its historicity, A. Harnack said: "That these doubts were mistaken is today unquestionable for all scholars, save those who turn from the light." (*Geschichte der altchristlichen Literatur bis Eusebius,* 3 vols. 1893–1904, vol. 2, p. 244). It is probable that this martyrdom took place under Nero, in 64 A.D., at the beginning of the persecution of Christians, for which that emperor was responsible. The same literary testimony for Peter's martyrdom at Rome is, in many instances, the testimony for his Roman sojourn, asserting that he exercised his apostolic ministry there. Clement of Alexandria (Eusebius, *The Ecclesiastical History,* vi, xiv), states that Mark's Gospel is the record of Peter's preaching at Rome, written at the request of the Christian converts living there. How long the apostle was at Rome before his martyrdom is a matter of uncertainty; the tradition of a twenty-five year sojourn rests on no certain data, and is quite improbable.

MYLES M. BOURKE,
Professor of Sacred Scripture, Saint Joseph's Seminary, Dunwoodie, New York.

SAINT PETER, Minn., city and Nicollet County seat; on the Minnesota River; 67 miles southwest of Saint Paul; on the Chicago and North Western and the Chicago, Saint Paul, Minneapolis and Omaha railroads; and state and federal highways. Situated in a dairy, stock, grain and poultry farming section, it has kindred industries; a gravel washing plant; and manufactures men's work garments. The Gustavus Adolphus College, a co-educational institution of higher learning, founded under Lutheran auspices at Red Wing in 1862, was removed to its 25-acre campus here in 1876; and there are a Carnegie public library, and the Nicollet County Historical Society Museum. Of especial interest are the Old State Capitol Building, erected in 1857, when it was proposed that the state capital should be transferred from Saint Paul; and a monument to John A. Johnson (q.v.), a native son who served three terms as governor of the state. Near by is the Traverse des Sioux State Park. Saint Peter has a large state hospital for the insane. The city was founded by Capt. W. B. Dodd in 1853; has a mayor and council; and owns its water works. Pop. (1940) 5,870; (1950) 7,754.

SAINT PETER PORT, Channel Islands, capital of the Island of Guernsey, on the east coast, rises in terraces on the slope of a hill, above a harbor protected by extensive breakwaters. The picturesque 12th century Castle Cornet stands on an island at the mouth of the harbor and Fort George is built on the heights south of the city. Saint Peter Port's streets are steep and narrow, its environs are of exceptional beauty and there are many fine residences. Notable buildings include Saint Peter's Church, a Gothic structure dating from the 14th century; Elizabeth College, founded by Queen Elizabeth in 1563; and Hauteville House, home of Victor Hugo in 1856–1870. Pop. (1931) 16,720.

SAINT PETER'S BASILICA, Vatican City, Rome, generally considered the greatest of Catholic churches, and intimately associated with the Vatican. It is not a cathedral, however, since the pope, as bishop of Rome, derives his title from another church, St. John Lateran, although most of the papal ceremonies have taken place in St. Peter's since the year 1870. St. Peter's is built on the site of the Circus of Caligula. A small sanctuary previously erected there gave way to a basilica during the reign of Constantine (306–337). The latter structure was rebuilt during the early Renaissance after being damaged during the residence of the popes at Avignon. Unfortunately, the length of time consumed in building the present structure (from 1450 to 1626) allowed the plans to be changed several times so that neither the designs of Bramante, employed by Julius II (r. 1503–1513), or those of Michelangelo (under Paul III, r. 1534–1549) were adopted in full, and the series of compromises leaves something to be desired architecturally. The most striking features of the basilica are Michelangelo's beautiful dome, completed about 1590, and the covered colonnade of Giovanni Bernini which leads to the façade after partly encircling the Piazza San Pietro. The colonnade was completed about 1667. The façade, completed in 1626, is largely the work of Carlo Maderna and has been criticized as being out of scale, since even from the far end of the

Piazza San Pietro, some 1,000 feet away from the building, the façade prevents a clear view of the dome. Above the façade is the loggia where the pope is crowned and where he appears on various public occasions. The basilica is immense, covering some four acres and accommodating 50,000 persons. Thirty-four altars, including the main one built over the tomb of St. Peter, are inside the church, which also contains numerous statues and other works of art, and the tombs of many ecclesiastical and temporal dignitaries, notably those of popes and emperors. The scale of the interior and its ornamentation is so vast as literally to dwarf the human figure. See also ROME—*Religion, Churches.*

SAINT PETER'S CANAL. See CANADIAN CANALS.

SAINT PETER'S LAKE, Quebec, Canada, an expansion of the Saint Lawrence River, 35 miles long by 10 miles wide; about midway between the Richelieu and Saint Maurice rivers, and the outlet of many others, including the Saint Francis. Its southern portion has many islands, notable for their fine scenery.

SAINT PETERSBURG (now LENINGRAD), Russia. See LENINGRAD.

SAINT PETERSBURG, Fla., city and port of entry in Pinellas County; at the south end of the peninsula between Tampa Bay and the Gulf of Mexico, but separated from the latter by a chain of islands and Boca Ciega Bay; 275 miles southwest of Jacksonville; on the Atlantic Coast Line, and the Seaboard railroads; with airline and steamship transportation; served by the 7 mile Gandy Bridge across Tampa Bay, and by causeways over Boca Ciega Bay to the island beaches of the Gulf. Saint Petersburg is a resort and residential city, with a sub-tropical setting and year round attractions. Its climate is equable, the highest recorded temperature being 97°, the lowest 28°; while an average of 360 sunny days a year gives it its name of the "Sunshine City." The number of visitors entertained annually totals about 500,000. Built with broad streets, handsome parks and extensive provision for outdoor living and recreation, Saint Petersburg is noted for its thousands of attractive homes, excellent hotels and ample facilities for the entertainment of guests. The beauty of the city is enhanced by its numerous lakes, while the 33 miles of waterfront afford splendid beaches and have many parks and pleasure grounds. The great Municipal Recreation Pier extends a half-mile into Tampa Bay, and an indoor pool and solarium are located on its approaches. The city has exceptional fishing, commodious yacht harbors and boat basins, fine golf courses, and probably the largest shuffleboard club in the world. Saint Petersburg ships fruit, vegetables and fish, and its manufactures include canned goods, building materials and novelties. It has an accredited junior college, a United States Maritime Training School, and the Florida Military Academy is near by at Gulf Port. There is a Coast Guard Air Station, and the United States Veterans Hospital is west of the city line. Points of interest are the Memorial Historical Museum; Turner's Sunken Gardens; the Florida Wild Animals and Reptiles Ranch; and the Alligator Farm. The city was founded by John C. Williams, of Detroit, who purchased the land in 1876 and secured the building of its first railroad in 1888. It was incorporated in 1892, with a population of 300. Pop. (1950) 96,738.

SAINT PETERSBURG, Declaration of, an agreement between the European powers signed in 1868 at Saint Petersburg (Leningrad), Russia, by representatives of Austria, Belgium, Bavaria, Denmark, France, Great Britain, Italy, the Netherlands, Persia, Portugal, Germany, Russia, Sweden, Norway, Switzerland, Turkey and Württemberg. The powers agreed to use in war no explosive projectile of less weight than 400 grams, or 14 ounces avoirdupois. Other provisions were made to reduce the death rate and alleviate the suffering of injured and disabled soldiers by the use of more humane implements of war; practically all of the agreements were discarded by the combatants in the First and Second World Wars.

SAINT PHILIP. See FOGO.

SAINT PHILIP, Fort. See FORT JACKSON AND FORT SAINT PHILIP.

SAINT-PIERRE, Jacques Henri Bernardin de, zhäk ŏñ-rē băr-när-dēn de săñ pē-ār, French author: b. Havre, Jan. 19, 1737; d. Eragny sur-Oise, Jan. 21, 1814. He studied at Caen and Rouen, and entered the army as an engineer, but was dismissed for insubordination in 1761; spent five years in European capitals, seeking support for republican ideals; and afterwards lived in France, except for three years, 1768–1771, when he held an engineer's commission at Mauritius. His first book, *Voyage à l'île de France* (1773), attracted little attention, but recognition as a master of prose came with the publication of his *Etudes de la nature* (1784), while in 1787 *Paul et Virginie* (q.v.), won him immediate and lasting fame. He was admitted to the institute in 1795. Other of his works are *Essai sur Jean Jacques Rousseau* (1790); *La chaumière indienne* (1790); *Harmonies de la nature* (1796); *Correspondence* (7 vols. 1826). Consult Maury, *Etude sur la vie et les oeuvres de Bernardin de Saint-Pierre* (1892).

SAINT-PIERRE, Jacques Legardeur de, zhäk lā-gär-dėr dė, French soldier: b. Normandy, 1698; d. near Lake George, N. Y., 1755. He served with the French Army in Canada against the British in 1740; made Rocky Mountain and Saskatchewan River explorations in 1752; and was in command of Fort de Boeuf, Ohio, when George Washington, as adjutant general of Virginia, presented Governor Dinwiddie's demand that the French leave British territory. Washington in his journal wrote favorably of the French officer. Saint-Pierre was succeeded by Contrecouer in 1753; and led the Indian allies in the Dieskau expedition of the French and Indian War, in which he was killed in action.

SAINT PIERRE, Canada, town in Jacques Cartier County, Quebec, on the north bank of the Lachine Canal, between Montreal West and Lachine, and on the Canadian National and the Canadian Pacific railways. Industries include railway carriage and glass works. Pop. (1951) 4,976.

SAINT PIERRE. See RÉUNION, ILE DE LA.

SAINT PIERRE, West Indies, a former chief town in the volcanic island of Martinique (q.v.). Prior to the eruption in 1902 of Mont Peleé, Saint Pierre was the largest and most flourishing city not only of Martinique but of the Lesser Antilles, with a population of 26,000. It was an important seaport and a bishop's see. The principal buildings were the cathedral, lyceum and palace of justice. There was a fine botanical garden containing rare and peculiar specimens, etc.— all destroyed by the sudden catastrophe above noted, together with the entire population.

SAINT PIERRE AND MIQUELON, mēk-lŏn. The small colony of Saint Pierre and Miquelon is doubly interesting for France inasmuch as it is the only one of the French settlements which is situated outside the tropical zone, and is furthermore the last link which exists of France's one-time Canadian empire. The colony, moreover, despite its small area, has been prosperous for a number of years, thanks to its fishing industry, but this latter has recently declined a little. The three islands of Saint Pierre, of Greater and Smaller Miquelon, have an area of 241 square kilometers (93 square miles) and a population of about 4,175. The islands are situated on the Atlantic Ocean, 15 to 30 miles from the southern coast of Newfoundland and about 3,700 kilometers (2,298 miles) from the port of Brest.

The form of Saint Pierre is most irregular: high and rocky from the cape of Aigle, running in an eastern, northern and western direction as far as Cape Savoiard; becoming inflected toward the country dominated by Mount Galadry. The island of Miquelon is divided into two parts: Greater Miquelon and Smaller Miquelon, the latter commonly called Langlade. Smaller Miquelon is separated from Saint Pierre by a stretch of sea about a league wide which is highly dangerous to navigation. Saint Pierre is the only part in the entire colony which possesses a harbor capable of anchoring large vessels arriving from Europe or America.

There are six islets dependent on Saint Pierre, Greater and Smaller Colombier and the four islets, Ile aux Chiens, Ile aux Vainqueurs, Ile aux Pigeons and Ile Massacre.

The climate is severe. Although Saint Pierre is situated in a more southerly latitude than Paris, winter is very cold and long; living conditions are hard and were it not for the fishing industry the country would be desolate.

Industries, etc.— Cod fishing is the only remunerative industry of the colony. This is a profitable trade for the ship-owners and makes an excellent school for sailors. The fisheries were very prosperous some years ago, the exportation of cod amounting in 1899 to about 15,000,000 francs ($3,000,000), but fell to 6,000,000 in 1905 ($1,200,000), dropping still lower in subsequent years. Connected with the cod fishing industry are ll the other seaport trades (carpentry, sailmaking, smithing, cooperage).

The agricultural resources of the colony are not very important. The island of Saint Pierre is really just a rock, almost devoid of fertile soil and would have been entirely unproductive if the inhabitants had not to a certain extent overcome nature. Miquelon is better suited for agricultural experiments. The average trade of Saint Pierre and Miquelon during the five years 1911 to 1915 was 11,517,267 francs ($2,303,453); in 1944 imports were valued at 37,250,000 francs and exports at 10,416,000 francs.

History.—Fishing attracted Frenchmen there from the time of Henri IV. While many Normans and Saintonegals settled in Canada, Bretons and Basques came to the island in 1604 to fish for cod. Expelled from Newfoundland in 1713 and Acadia in 1763, many French Canadians settled in Saint Pierre and Miquelon. However, in 1778, the English forced these emigrants, numbering some 2,000, to return to France. After the Treaty of Versailles in 1783, they returned to the two islands only to be driven out again during the Revolutionary Wars, but came back in 1816 when the colony was definitely restored to France. The Anglo-French agreement of 8 April 1904 definitely settled all differences regarding the French shore, i.e., the rights of preparing and drying the fish. By this arrangement France retained fishing rights in the territorial waters of the French shore; or in other words over a coast 18 kilometers (12 miles) in length.

SAINT QUENTIN, săn kŏn-tăn, France, a city in the department of Aisne, on an acclivity overlooking the Somme, about 95 miles northeast of Paris. The location of Saint Quentin is of considerable strategic importance, and it has figured conspicuously in various wars, notably in 1557, in the Franco-German War in 1870, and most severely in the great World War of 1914–18. It was the centre of some of the most ruthless acts of warfare in the Teutonic assaults and little remained after the conflict but a great ruin pile. Under the terms of the Peace Treaty of 1919 German labor and capital, as determined by the Reparation Commission, have effected a complete restoration. Prominent among its buildings is the fine Gothic church of Saint Quentin, erected 1114–77, with a special feature of double transepts. Other buildings are the courthouse, library, theatre, hospitals and lyceum. The principal manufactures are cotton and woolen goods, tulle, embroideries, lace and guipure of several kinds; there are important foundries, machine works for various special industries, brick and tile yards, and in the vicinity, numerous sugar mills. There is an active commerce in cotton and linen yarn and in grain. Several monuments and statues commemorate the defense of the town and its native literary celebrities. Pop. about 50,000. See WAR, EUROPEAN.

SAINT RAYMOND, Canada, village in the province of Quebec, on Little River Sainte Anne, 28 miles west of the city of Quebec, and on the Quebec and Lake Saint John and the Canadian Northern Railroad. There is a Roman Catholic convent and Saint Joseph's Commercial College is located here. Pop. 1,772.

SAINT REGIS, rē'jĭs, N. Y., and Canada, village, part in Franklin County, N. Y.; alt. 170 feet; part in Huntingdon County in the province of Quebec, on the right bank of the Saint Lawrence River, at the mouth of the Saint Regis River. It was settled in 1760 by the Saint Regis tribe of the Iroquois Indians, and is inhabited solely by their descendants. Both the British and American branches of the tribe speak the Mohawk language. The village is about five miles from a railroad station in New York State; but

it has steamboat connection with Cornwall, Ont., and in summer with all river ports. The village is in a fertile agricultural region; the Reservation extends along the Saint Lawrence, in both the United States and Canada, for about nine miles. Many of the Indians are engaged in farming, but the chief occupation is basket-making in which they excel. The historic Caughnawaga bell hangs in St. Regis Roman Catholic Church. The bell was a gift of Louis XV of France, was captured by the British, hung for a time at Groton, Mass., whence Indians retook it. Saint Regis has five schools in New York State and two in Canada. Eleazar Williams lived here for some time. Pop. (1940, St. Regis Indian Reservation) 1,262.

SAINT REGIS INDIANS, a group of Roman Catholic Iroquois from Caughnawaga, Quebec, who during the French and Indian War were established in a village which is now the boundary between New York and Quebec. The Jesuits founded among them the mission of Saint Francis Regis, hence their present name. These Indians remained neutral during the Revolution, and their number was considerably augmented by other Iroquois early in the 19th century; but their reservation extending across the international boundary, they were divided in partisanship during the War of 1812. There are now about 3,000 of these Indians remaining, approximately half on the Canadian and half on the New York side.

SAINT REMY, săn rē-mē, France, in the department of Bouches-du-Rhône, near the forest of Saint Benoit, is a village 14 miles northeast of Arles. It is celebrated for its Roman antiquities, the chief of which are the triumphal arch (100 A.D.) and the monument of the Julii. The latter is attributed to the period of the early empire, and consists of a square base ornamented with military basreliefs, surmounted by Corinthian semi-columns connected by arches, which support a second series of 10 Corinthian columns and a dome. Two statues stand in the upper portion. In the neighborhood of Saint Remy is the old priory of Saint Paul-de-Mausole with a Romanesque church and cloister of historic interest. Near the village are building-stone quarries, and seed-cultivation is carried on.

SAINT RONAN'S WELL, a novel by Sir Walter Scott, published in 1823. The scene is laid about a mineral spring, a quasi watering place, called Saint Ronan's Well. The book is the only society novel attempted by Scott.

SAINT-SAENS, Charles Camille, French musician: b. Paris, 3 Oct. 1835; d. Algiers, 16 Dec. 1921. He received his musical education in the Conservatory of Paris; in 1853 became organist of the church of Saint Merri, and in 1858 of the Madeleine, where he continued till 1877. His first comic opera, 'La princesse jaune,' was produced in 1872, and 'La timbre d'argent' in 1877. 'Samson et Delilah,' a sacred drama, was produced at Weimar also in 1877, and was subsequently successfully revived at Rouen. His grand operas 'Etienne Marcel' (1879); 'Henry VIII' (1883); 'Proserpine' (1887); 'Ascanio' (1890); 'Phryné' (1893), have not maintained their early popularity to the present day. He produced 'Andromaque' (1903), and 'L'Ancêtre' (1906), and was known also as a musical critic and author of 'Rimes familières' (1886); 'Problèmes et Mystères' (1894). He was elected member of the Academy in 1881. Although he did not attain highest rank in opera, many of his instrumental works, which include three symphonies, four symphonic poems, two orchestral suites, several concertos for piano and orchestra and violin and orchestra and a quantity of chamber music, show consummate talent if not genius. Consult Neitzel, 'Saint-Saens' (1899); Baumann, L'Œuvre de Saint-Saens' (1905).

SAINT-SIMON, Claude Henri, klōd ŏn-re săn-sē-mōn (Eng. sānt sī'mọn), COMTE DE, French socialistic reformer: b. Paris, 17 Oct. 1760; d. there, 19 May 1825. Born of a family which traced its descent to Charlemagne he conceived that his origin destined him to great achievements. At 13 he offended his father by skeptically refusing to receive his first communion. Before he was 16 he gave his servant orders to call him in the morning with the summons, «Rise, M. le Comte, you have great things to do.» At 18 he entered the army and he served in the closing campaigns of the American War of Independence, distinguishing himself on the day of Cornwallis's surrender at Yorktown (17 Oct. 1781). Returning home with the order of Cincinnatus, he was captured in the naval combat in which the French were defeated by Rodney, and remained a prisoner at Jamaica till the peace of 1783. On his return he was created a Knight of Saint Louis, and appointed colonel of a regiment; but after a brief period of garrison duty at Metz, abandoned the service in order to travel. He went to Holland in 1785, and to Spain in 1787. Here he was successful in introducing diligences in Spain. On the outbreak of the Revolution of 1789 he joined himself to those who petitioned the assembly for the abolition of titles of nobility, but took no further part in the political movements of the time; being wholly absorbed in the pursuit of wealth. Speculation in the national domains created by the confiscation of the effects of the nobility and clergy afforded unlimited scope for his ambition. In this career he was joined by De Redern, whom he had known in Spain. Their speculations were at first unfortunate. Redern fled and Saint-Simon was imprisoned as a nobleman for 11 months. On his liberation he realized a considerable fortune by paying for the property he had acquired in assignats, the market value of which had fallen to six francs the thousand, while they were still received at full value in payment of the national domains. During his imprisonment he had plenty of time for reflection and the thoughts he entertained may be guessed from a vision which he had. «Charlemagne,» he relates, «appeared to me and said, 'My son, your success as a philosopher will equal mine as a warrior and statesman.'» In order to fulfil the mission which he had thus received he became in his 38th year a student of science, resided opposite the Ecole Polytechnique, and subsequently the Ecole de Medecine, in order to enjoy communications with the professors, whom he invited to his table.

In 1802 and 1803 he traveled in England and Germany, without, as he says, acquiring any new experience of importance. During his stay at Geneva he produced his first work

Lettre d'un habitant de Genève à ses contemporains. He proposed that the savants should be maintained at the public expense; that spiritual power should be in their hands, temporal in that of the proprietors; while the "great chief of humanity" should be elected by the masses. Religion, he observed, was merely a human invention. Having exhausted his means he obtained the post of a clerk at the *mont de piété.* At this time he encountered Diard, whom he calls his only friend. This associate not only took on himself the charge of his maintenance, but provided means for the publication of his works.

The death of Diard in 1810 plunged him again into want; and having written two more works, *Sur la science de l'homme* and *Sur la gravitation universelle,* he found himself without means to publish them. Later Augustin Thierry, who became his intimate disciple, cooperated in editing his work on the *Réorganisation de la société européenne* (1814), in which he endeavored to demonstrate the uselessness of the Congress of Vienna, and to show that a European parliament, with the right to determine differences between different nations, was the only means of preserving general peace; and for the promotion of this he advocated union between England and France. The last proposal, perhaps the most sensible he had yet made, caused him to be regarded as a madman. This was his first work which attracted general notice. Finding the difficulty of procuring the means of subsistence and of publishing his works increasing, he made an unsuccessful attempt in 1823 at self-destruction which resulted in a mutilated visage and the loss of an eye. He next produced his last work, *Le nouveau christianisme* (1825), to which he owes his position as the founder of a sect. Christianity he now averred to be a progressive system, which had been rendered immovable by the bonds of ecclesiastical law. Taking its fundamental principle of love he held the church to be a complete organization of society for ministering to the wants of the whole, and especially of the more numerous and poorer classes. A social hierarchy based on capacities and services, with authority to divide heritages, distribute salaries, regulate vocations and take all necessary means for making the labor of all contribute to the common good, was deduced from these premises by his disciples.

The disciples of Saint-Simon rapidly grew into a sect, and were joined by other eminent men. They attempted to idealize the life of their founder, and make it a consistent whole, dominated from the first by the idea of the mission he was to accomplish. Society was divided by the Saint-Simonian doctrine into three classes, priests, savants and laborers, and was to be governed by the chiefs of the three classes. Capacity was to be the ground of distribution of functions. All property was to become on the death of the proprietor the property of the church or society. All children were to receive a general education till their particular capacities became manifest. Saint-Simonism in short was an attempt to render men benevolent by external regulations; to do the work of Christianity without its authority and without its weapons.

SAINT-SIMON, Duc de (Louis de Rouvroy), French author: b. Paris, Jan. 16, 1675; d. Laferté, March 2, 1755. He entered the army in 1693, but soon resigned because not given anticipated promotion, then was employed in several diplomatic missions, and was one of the council of regency under the duke of Orleans; but with the accession to the regency of the duke of Bourbon he fell into disgrace, and withdrew from public life. His memoirs, commenced in 1694 while he was serving in the army and on which he labored for 60 years, remained a long time in manuscript, and were afterward published in a mutilated form with many suppressions. The first edition, in 13 volumes, appeared in 1791; an edition by Cheruel and Regnier, in 20 volumes, in 1856 fol., and revised in 1873–1877; and the first complete edition appeared in Paris in 1829–1831 (in 21 vols.), entitled *Mémoires complets et authentiques du Duc de Saint-Simon sur le Siècle de Louis XIV, et la Régence, publiés pour la Première Fois sur le Manuscrit Original Entièrement Ecrit de la Main de l'Auteur, par M. le Marquis de Saint-Simon.*

SAINT SIMON, sânt sī'mŭn, an island of Georgia, at the mouth of the Altamaha River, and separated from Jekyl Island, on the south, by Saint Simon Sound, and from Wolf Island on the north, by Altamaha Sound. It is one of a group of islands long famous for the production of sea-island cotton. In 1733 this island, together with some of the mainland adjacent, was ceded to James Oglethorpe by the Creek Indians. The settlement on the island was attacked in 1742 by a Spanish force from Saint Augustine. The soil is fertile and the vegetation luxuriant.

SAINT SOPHIA, sō-fē'ä, Constantinople, the most famous Byzantine church, was sponsored by the Emperor Justinian and designed by Anthemius of Tralles and Isidorus of Miletus. Begun in 532, it was dedicated December 27, 537. As a result of an earthquake in 558, part of the work collapsed, to be rebuilt and the apex of the main dome raised about 20 feet by the younger Isidorus, completed 563.

The church proper takes the form of a rectangle measuring about 260 feet by 240 feet, divided longitudinally into a nave and side aisles. The nave is covered by a dome, 100 feet by 106 feet and 184 feet high, supported on four pendentives; half domes to the east and west abut it and are themselves abutted by domed exedrae. To the north and south broad arches carry the main dome. The aisles are vaulted in a variety of forms with women's galleries above. A ring of windows at the base of the dome floodlight the interior, with additional windows in the walls above the aisles and elsewhere. Monolithic columns of green Molossian marble separate nave and aisles, while porphyry shafts are used in the exedrae. The four main piers supporting the pendentives are built of stone, peperino, but the walls, arches, and vaults are in brick. These materials are, however, sheathed in colored marble so cut that the veining pattern is reversed in neighboring slabs. Richly carved capitals and moldings were treated with gold leaf contrasting with deep blue in the incisions. The upper part of the walls and the arches and vaults are completely covered with mosaic, largely in pure design against a gold background but with some

figure compositions in the vestibule and elsewhere, and cherubim on the main pendentives. The ambo, iconostasis, and ciborium were sheathed in silver while the crucifix and altar were of gold.

So sumptuous a building could hardly have been completed without the close backing of the emperor; it is estimated to have cost $75,000,000. The most obvious later additions are the four minarets constructed after the Turkish conquest of Constantinople in 1453 and the conversion of Saint Sophia into a mosque. The Turks also covered the figure mosaics and, in 1847–1849, added the brownish red banding of the exterior in stucco. In the present century the Turkish government permitted the mosaics to be uncovered, and on Feb. 1, 1935 converted the famous building from a mosque into a museum.

Consult Lethaby, W. R., and Swainson, H., *The Church of Sancta Sophia, Constantinople: A Study of Byzantine Building* (1894); Swift, E. H., *Hagia Sophia* (1940).

Everard M. Upjohn,
Associate Professor of Fine Arts, Columbia University.

SAINT STEPHEN, town, Province of New Brunswick, Canada, in Charlotte County, at the head of tidewater on the St. Croix River which enters the Bay of Fundy about 60 miles west of the city of St. John. It is immediately opposite the town of Calais, Maine, with which it is connected by an international bridge. It is on the Canadian Pacific main line from Montreal to St. John and has steamboat services with St. John and other Bay of Fundy ports. Founded by United Empire Loyalists, and later a lumbering and shipbuilding center, there are now 16 local industries, the largest being a confectionery factory. The Chipman Memorial Hospital, and a weekly newspaper, are in the town. Pop. (1951) 3,746.

SAINT SWITHIN, an English prelate of the 9th century, chaplain to King Egbert and tutor to his son, Ethelwulf. He was ordained to the priesthood in 830, was charged with the education of Prince (afterward king) Alfred, and in 852 was made bishop of Winchester. He died about 10 years later. He was canonized a century later. The popular knowledge of this saint's name is due to the belief that if rain falls on July 15 (which is commonly known as Saint Swithin's Day) it will rain for six weeks after. This notion is said to have arisen from the fact that when the bones of Saint Swithin were about to be removed, after his canonization, from their original resting-place in Winchester church-yard to the interior of the cathedral, their removal, which was to have taken place on July 15, was delayed for 40 days by the excessive rains which fell uninterruptedly for that period. In France, the watery saints' days are those of Saint Médard (June 8) and Saints Gervais and Protais (June 9); in Flanders the rainy saint is Saint Godelième; and in Germany there are three saints' days, to which this belief attaches. The origin of the tribute called "Peter's Pence" has often been assigned to Saint Swithin.

SAINT THOMAS, city, Province of Ontario, Canada, about 120 miles west of Toronto, the county center of Elgin County which is one of the most productive mixed farming and fruit-growing areas of the province, fronting upon the middle section of Lake Erie. It is noted as a transportation center situated about midway between Buffalo and Detroit, being divisional point of the Michigan Central, Wabash, and Pere Marquette railways in addition to branches of the Canadian National and Canadian Pacific systems. It is also on the London and Port Stanley Electric Railway 16 miles south of London and 8 miles north of Port Stanley on Lake Erie which connects with Cleveland across the lake. The railway repair shops are among the largest of the local industrial plants, but there are large manufactories of railway rolling stock and equipment as well as of automobile supplies, miscellaneous brass and copper products, and neon signs. There is an industrial commission and a planned industrial area of 78 acres. It is pleasantly situated on Kettle Creek, and an equable climate makes it a popular residential city. St. Thomas was founded by and named after Col. Thomas Talbot a companion in arms of the Duke of Wellington who obtained a grant of 5,000 acres in the neighborhood and settled at near-by Port Talbot in 1803. Population (1951) 17,942.

SAINT THOMAS, second largest of the United States Virgin Islands, lying 40 miles east of Puerto Rico; area 27.12 square miles. The surface is hilly, and only a small portion of the land is cultivated; sugarcane, aloes, fibrous plants, fruit, cotton and vegetables are grown, but cattle raising is increasingly important. Rum and bay-rum distilling are the chief industries and there is a growing tourist industry. The population is predominantly Negro, with a minority of Norman-French settlers. Saint Thomas was once of great commercial importance; its capital, Charlotte Amalie, which is also the capital of the Virgin Islands of the United States, was at one time one of the chief emporia of the West Indies.

The island was first colonized by the Dutch in 1657, but they soon abandoned it. A Danish settlement in 1666 was also ephemeral, but in 1672 the Danes made a permanent settlement at St. Thomas Harbor. After a period of control by a Danish company the island was returned to the crown in 1755 and Charlotte Amalie became a free port. The English held it in 1801–1802 and 1807–1815. Slavery was abolished in 1848.

In 1870 negotiations were made for its purchase by the United States, but Congress refused to ratify the treaty; it was also included in the treaty of 1902 for the purchase of the Danish West Indies by the United States, which was rejected by the Danish Folkething. The sale was consummated in 1917 by the payment to Denmark of $25,000,000, after protracted negotiations conducted for the United States by Maurice Francis Egan, American minister to Denmark. During World War II the United States maintained a base here. Pop. (1950) 13,811. See Virgin Islands of the United States.

SAINT THOMAS (Port. São Thomé, sounn tōō-mâ'), West Africa, a volcanic island in the Gulf of Guinea, 170 miles west of the mouth of the Gabun River, belonging to Portugal. Its highest peak, Saint Anna, rises from the center of the island to a height of about 7,000 feet. The valleys are fertile but unhealthful; the ele-

vated portions, swept by fresh breezes, are on the contrary, salubrious. The chief products are coffee and cocoa, cotton, sugar, indigo, sweet potatoes, dates, etc. There are large numbers of domestic animals. Saint Thomas, on the northeast coast, is the seat of a bishop, and the chief town. The island was discovered by the Portuguese on Saint Thomas Day, 1471, and was colonized in 1493. The Dutch occupied it from 1641 to 1844. With the island of Principe it forms a province administered by a governor with a total area of 320 square miles, and total pop. of 59,055.

SAINT THOMAS. See Sao Thomé.

SAINT THOMAS, Christians of. See Christians of Saint Thomas.

SAINT VALENTINE'S DAY, the 14th of February, so called after a Christian martyr of the Roman period. The custom peculiar to the day of exchanging missives of affection and love is believed to have been handed down from the Roman festival of the Lupercalia, celebrated in the month of February, when the names of young women were put into a box and drawn out by men as chance directed. For many centuries, if not up to the present time in certain remote districts, Saint Valentine's Eve was celebrated in a manner very similar to the fashion of Roman heathen times, maids and bachelors throwing billets with their names on into a receptacle and drawing therefrom by chance the name of some one of the opposite sex, who became thereupon for the year following the "valentine," or chosen companion, of the other more or less lucky individual. The sending of valentines by message or mail is one outgrowth of the custom formerly prevalent. The custom has expanded in the presentation of affectionate valentines by parents to children and children to parents and husbands and wives to each other. In genial climates Valentine's Day is about the mating period of birds, and this is supposed to have had something to do with the origin of the customs with which the day is associated.

SAINT-VICTOR, săn-vĕk-tŏr, **Jacques Benjamin Maximilien,** Comte de, West Indian author: b. Fort Dauphin, Santo Domingo, 14 Jan. 1770; d. Paris, France, 8 Aug. 1858. He was educated at the college of La Fleche, France, and entered journalism. During Napoleon's reign he was on the staff of *Journal des Débats* and after 1815 he established several Roman Catholic and royalist magazines. He revisited his native land in 1830, spent two years in the United States and then made a tour of the West Indies. He wrote 'Tableau historique et pittoresque de Paris depuis les Gaulois jusqu'à nos Jours' (1808–12); 'Œuvres poétiques' (1882); 'Lettres sur les Etats-Unis ecrites en 1832–33' (2 vols., 1835); 'Journal de Voyage' (2 vols., 1836), etc.

SAINT-VICTOR, Paul Binsse, Comte de, French author: b. Paris, 11 July 1825; d. there, 9 July 1881. He first made himself known as a dramatic and art critic, but soon rose to eminence as a student of the drama and of art and a permanent contributor to the literature of these subjects. His best-known books are 'Men and Gods' (1867–72), and 'The Two Masques' (1880–83). He also wrote 'The Women of Goethe' (1869): 'Victor Hugo' (1885); 'Ancients and Moderns' (1886), and 'The Theatre of To-day' (1889).

SAINT VINCENT, vĭn'sĕnt, **John Jervis,** Earl, English naval officer: b. Medford, Staffordshire, 9 Jan. 1734; d. 15 March 1823. He entered the navy as able seaman in 1744 and in 1760 was promoted to captain and in 1787 to rear-admiral. In the Quebec expedition he led the advance squadron in charge of transports. In 1790 he was returned to Parliament for Wycombe. He commanded in the naval expedition against the French West Indies in 1793 and two years later was made admiral and given command of the Mediterranean fleet. In the engagement with the Spanish fleet of Cape Saint Vincent, 14 Feb. 1797, he captured four of the enemy's ships and averted the impending invasion of England. For this he was granted a pension and made Earl Saint Vincent. He was first lord of the Admiralty 1801–04 and introduced many reformatory measures. He held once more command of the Channel fleet, but retired in 1807. At his death the nation raised a statue to him in Saint Paul's Cathedral.

SAINT VINCENT, one of the Windward Islands, British West Indies, lying between Saint Lucia and Grenada, area, 150.3 square miles. A chain of volcanic mountains traverse the island from north to south, culminating in the volcano of Soufrière in the north (3,000 feet). Many of the valleys are fertile and about one-sixth of the total area is under cultivation. Sugar was once the most important product, but the sugar industry has declined, especially since the hurricane of 1898 which destroyed a large number of plantations. The production of arrowroot has correspondingly increased in importance; cocoa, cotton, fruits and vegetables are also raised, and good timber is obtained from the forests. There is a considerable trade, particularly with the United States. In 1937 the total imports had a value of £203,304; exports £187,086; total revenue, £94,809; total expenditure, £97,502; public debt, £95,390. The island was discovered by Columbus in 1498, and was then inhabited by Caribs; the Caribs were finally subdued by Great Britain in 1795–96 and transported to Ruatan, in the Bay of Honduras; a few returned to Saint Vincent where a reservation was assigned them. The island is governed by an administrator and a legislative council of three official and four nominated unofficial members; before 1877 there was a representative government. In 1812 an eruption of Soufrière devastated a part of the island, and in May 1902 occurred another eruption, contemporaneous with that of Mont Pelée (q.v.). Premonitory signs of eruption were given as early as February 1901, and these warnings increased as soon as Mont Pelée began to be active; the eruption commenced on 6 May, with a burst of smoke, followed by flames; it ceased for a time the next morning, but reached its full force in the afternoon of that day (7 May). Several large plantations were destroyed and about 1,600 persons killed. Pop. 47,961.

SAINT VINCENT DE PAUL. See Vincent de Paul, Saint.

SAINT VINCENT DE PAUL, Society of. See Society of Saint Vincent de Paul.

SAINT VITUS' DANCE. See Chorea.

SAINTE AGATHE DES MONTS, săntà-gat' dā môN', town, Province of Quebec, Canada, in Terrebonne County, about 50 miles northwest of Montreal, noted for its picturesque location on the North River in the Laurentian highlands. It is a popular health and holiday resort both winter and summer. Pop. (1951) 5,169.

SAINTE ANNE DE BEAUPRE, sânt ăn' dē bō-prā', town, Province of Quebec, Canada, Montmorency County, at the mouth of the St. Anne River on the north shore of the St. Lawrence River, 22 miles by rail northeast of Quebec city. For over a century the cathedral church of Ste. Anne, originating in a sailors' chapel in 1658, has been celebrated as the Lourdes of North America, many thousands of pilgrims coming annually to the shrine which is credited with miraculous cures. Pop. (1951) 1,827.

SAINTE ANNE DE BELLEVUE, sânt ăn' dē bĕl-vū', town, Province of Quebec, Canada, on Montreal Island in Jacques Cartier County, on the left bank of the Ottawa River at its confluence with the St. Lawrence which here widens into Lake St. Louis. In the 16th and 17th centuries it was the point of departure for traders and *voyageurs* to the West. It is still a port of call for St. Lawrence-Ottawa River shipping. The Macdonald College of Agriculture, incorporated with McGill University, is situated outside the town. Pop. (1951) 3,342.

SAINTE ANNE DE CHICOUTIMI, sânt ăn' dē shĭ-kōō'-tĭ-mĭ, town, Province of Quebec, Canada, in Chicoutimi County, on the Saguenay River. Owing to the industrial development of the surrounding district it has expanded considerably as a residential district in the decade following World War II. Pop. (1951) 3,966.

SAINTE-BEUVE, sănt bĕv, **Charles Augustin,** French man of letters: b. Boulogne-sur-Mer, France, Dec. 23, 1804; d. Paris, Oct. 13, 1869. After having studied physical and natural sciences under Lamarck and Magendie in Paris, he entered the school of medicine in 1823 and became assistant surgeon to St. Louis Hospital. He devoted, however, only four years to the practice of medicine and turned then to poetry and literary criticism. Having become a contributor to the liberal and philosophical journal, *Globe,* he collected his articles and published them as his first book under the title *Tableau historique et critique de la poésie française au XVI^e siècle* (1828). This book contained a review of Victor Hugo's *Odes et Ballades* and this piece of friendly criticism initiated a fruitful but short friendship between the two men. Sainte-Beuve later became the lover of Mme. Hugo and the discovery of the affair led to a complete break in 1834. In this period of his life Sainte-Beuve was also very much attracted by Saint Simonism and by Lamennais but later he renounced romanticism in all forms and turned to scientific literary criticism. In his "romantic period" he published three volumes of verses, *Vie, poésies et pensées de Joseph Delorme* (1829), *Consolations* (1831) and *Pensées d'août* (1837), and his only novel, the autobiographical *Volupté* (1834).

Sainte-Beuve began his critical work in 1832 and continued it until his death. He published the following collections of essays: *Portraits littéraires* (1832–1839), *Portraits de femmes* (1844), *Portraits contemporains* (1846), *Etude sur Virgile* (1857), *Chateaubriand et son groupe littéraire* (1860). Most famous of his literary essays were the *Causerie du lundi* (1849–1861) and *Nouveaux Lundis* (1861–1866), critical articles published every Monday, commencing in the *Constitutionnel* and continued in the *Moniteur* and the *Temps.* The entire series was republished in 28 volumes, of which the best 15 are entitled *Causeries du lundi* and the rest, *Nouveaux Lundis.* They earned him a worldwide reputation. Posthumous works include *P.J. Proudhon, sa vie et sa correspondence* (1872), *Lettres à la princesse* (1873), being letters to Mathilde, cousin of Napoleon III; *Cahiers de Sainte-Beuve* (1876), *Chroniques parisiennes* (1876), *Correspondence* (1877–1878), *Nouvelle correspondence* (1880), *Le clou d'or* (1880), *La pendule* (1880), *Lettres au professeur Gaullieur* (1895). In addition to his critical work, Sainte-Beuve also wrote a monumental history of the Jansenists, *Histoire de Port-Royal* (5 vols., 1840–1860).

Appointed keeper of the Mazarin Library in 1840, he was elected to the French Academy in 1844. In consequence of the revolution of 1848 he lost the librarianship. Professor of Latin poetry at the Collège de France (1854), the strongly anti-Bonapartist students resenting his support of the emperor interrupted him whenever he appeared in the classroom. He was transferred to the École Normale Supérieure, taught there for three years and, in 1865, was appointed a senator. At this time, however, he had become critical of the Second Empire and regained his popularity by his defense of freedom of thought and speech. His greatness as critic rests on his scientific, objective method, and his devotion to truth.

Bibliography.—Haussonville, Comte d', Bernard de Cléron, *Sainte-Beuve, sa vie et ses oeuvres* (Paris 1875); Troubat, Jules Simon, *Souvenir du dernier secrétaire de Sainte-Beuve* (Paris 1890); Harper, G. M., *Sainte-Beuve* (New York 1909); Benoit-Levy, C. E., *Sainte-Beuve et Mme. Victor Hugo* (Paris 1927); Bonnerot, J., *Bibliographie de l'oeuvre de Sainte-Beuve* (Paris 1937).

SAINTE CHAPELLE, sănt shăpĕl', Paris, one of the oldest palatine chapels and one of the most beautiful architectural monuments of France. It stands within the courtyard of the Palais de Justice. Louis IX (St. Louis) ordered it built as a shrine for the crown of thorns, pieces of the true cross, and other relics. The construction, begun in 1242 or 1243, was finished in 1248. Its Gothic nave, almost perfect in style, has a length of 115 feet and width of 36. It is divided into two distinct chapels. The upper chapel, used by the royal family and communicating directly with the royal apartments in the adjoining palace, has an exquisite interior; almost the entire wall space is occupied by 15 large windows of stained glass.

SAINTE-CLAIRE DEVILLE, sănt-klār-dĕ-vēl', **Henri Etienne,** French chemist: b. St. Thomas, West Indies, March 11, 1818; d. Boulogne-sur-Seine, France, July 1, 1881. Educated in France, he became professor at the Sorbonne in 1859. He undertook far-reaching researches into the phenomena of *dissociation,* physicochemical reactions, which he was the first to study scientifically. Deville put the aluminum and magnesium industries on a practical and commercial footing and he produced both metals on a large industrial scale. He discovered toluene and anhydride of nitric acid and made useful re-

searches into the metallurgy of platinum and other metals.

SAINTE FOY, town, Quebec, Canada, on the northern slope of the escarpment which constitutes the north bank of the St. Lawrence River (including the "Plains of Abraham") immediately above Quebec City. Ste. Foy is about five miles from the latter.

Ste. Foy is noted in Canadian history as the scene of a French victory over the British which came as aftermath to the more famous Battle of the Plains of Abraham and the surrender of Quebec to the British in 1759. The French Army on the latter event and on the death of Montcalm had withdrawn in disorder in the direction of Montreal. Reorganizing, however, under Levis, who had succeeded to the command, it advanced in the following spring to the recapture of Quebec now garrisoned by the British under Sir James Murray. A sortie by the latter was met and brilliantly repulsed by Levis at Ste. Foy on April 28, 1760. A column erected in 1863 commemorates the victory. The arrival, however, of a British flotilla robbed the battle of results by preventing the investment of the fortress, Levis being forced to withdraw upon Montreal where he shared in the surrender to Amherst in the following September.

The town has a large creamery but is in the main a residential adjunct to Quebec. There is an interesting church in the Renaissance style. Pop. (1941) 2,682; (1951) 5,207.

SAINTE GENEVIEVE, sânt jĕn'ĕ-vēv, city, Missouri, and Ste. Genevieve County seat; altitude 401 feet; on the Mississippi River, 65 miles southeast of St. Louis; on the St. Louis-San Francisco and the Missouri-Illinois railroads. It is an important trading center for the fruit orchards and dairy farms in the surrounding area. There are limestone quarries nearby with large kilns for the preparation of lime for commercial use.

Ste. Genevieve was first settled when the region was part of Louisiana but was moved back from the river because of floods. A church standing in the old town at that time was removed to the new site in 1794 and was used for forty more years. Old Memorial Park Cemetery dates back to 1796. At one time Ste. Genevieve's river trade made it a rival of St. Louis. The city government is administered by a mayor and a council. Pop. (1950) 3,992.

SAINTE ROSE DE LAVAL, Quebec, Canada, a town on the northwest shore (Rivière des Milles-Isles) of Jesus Island, Laval County, at the confluence of the Ottawa River with the St. Lawrence. It is mainly residential and suburban to Montreal, from the center of which it is about 12 miles distant and with which it is connected by railway (Canadian Pacific) and frequent bus services. Pop. (1941) 2,292; (1951) 3,630.

SAINTE THERESE, sânt tā-râz', island, Canada, about three miles long, in the St. Lawrence River at the foot of Montreal Island, in southern Quebec.

SAINTE THERESE DE BLAINVILLE, Quebec, Canada, a manufacturing town in the Terrebonne, about 18 miles northwest of Montreal on a branch of the Canadian Pacific Railway. Plywood and veneers are the principal manufactures, with musical instruments a close second. Altogether there are 29 manufacturing establishments, employing 1,229, and producing to the value of $7,282,229 (1948). There are two churches, an academy, a college, a hospital, and two banks. Pop. (1941) 4,659; (1951) 7,014.

SAINTINE, săn-tēn, **Xavier** (Real name Joseph Xavier Boniface), French novelist, poet and dramatist: b. Paris, France, July 10, 1798; d. there, Jan. 21, 1865. He collaborated with dramatists of reputation, including Scribe, Bayard, Désaugiers, and Ancelot, in about 200 plays. Among them were *L'Ours et le pacha* (1827), *Le Bouffon des princes* (1831), *Riche d'Amour* (1845), and *Henriette et Charlot* (1847). His most popular work was *Picciola* (1836), a touching story of a political prisoner whose cult for a flower growing in his prison yard saves his reason. Awarded the Montyon Prize, it was translated in many languages.

SAINTS' DAYS are days set apart by the Roman Catholic Church for religious services in honor of particular saints, after whom the days are named in the calendar. The celebrations differ in different countries, and according to the relation of the name of a particular saint to a particular locality.

In the United States and Great Britain such celebrations take the form of religious services held in churches. In continental Europe and in South America saints' days often take the form of great municipal or even national celebrations.

In Sweden, which is Lutheran as to state religion, it is customary to celebrate what is known as the name-day or day of the saint after whom a person is named, in a similar manner to a birthday.

SAINTS' EVERLASTING REST, The, a devotional work published by Richard Baxter (q.v.) in 1650. By its deep piety and its style of dignified eloquence, hardly a word of which has grown obsolete, it has taken a place with the *Pilgrim's Progress* in the literary treasures of English Nonconformity.

SAINTSBURY, George Edward Bateman, English critic: b. Southampton, Oct. 23, 1845; d. Jan. 28, 1933. He was educated at Oxford, was senior classical master in Elizabeth College, Guernsey, 1868–1874, when he became headmaster of Elgin Educational Institute 1874–1876. From 1875 to 1895 he was engaged in journalistic and literary work in London, and in the last-named year became professor of English literature in Edinburgh University. He held a leading place among contemporary English critics and among his many published works are *Primer of French Literature* (1880); *Dryden* (1881); *Short History of French Literature* (1882); *Manchester* (1887); *History of Elizabethan Literature* (1887); *Essays in English Literature 1780–1860* (1890); *Essays on French Novelists* (1891); *Miscellaneous Essays* (1892); *The Earl of Derby: Corrected Impressions* (1895); *19th Century Literature* (1896); *The Flourishing of Romance and the Rise of Allegory* (1897); *Sir Walter Scott* (1897); *A Short History of English Literature* (1898); *Mat-*

thew Arnold' (1899); 'A History of Criticism' (Vol. I, 1900; Vol. II, 1902; Vol. III, 1904); 'The Earlier Renaissance' (1901); 'Loci Critici' (1903); 'Minor Caroline Poets' (Vol. I, 1905; Vol. II, 1906); 'A History of English Prosody' (Vol. I, 1906; Vol. II, 1908); 'The Later Nineteenth Century' (1908); 'Historical Manual of English Prosody' (1910); 'History of English Criticism' (1911); 'History of English Prose Rhythm' (1912); 'The English Novel' (1913); 'First Book of English Literature' (1914); 'The Peace of the Augustans' (1915); 'A Last Scrap Book' (1924).

SAIONJI, sī'ŏn-jē, **Kimmochi,** PRINCE, Japanese statesman: b. Kioto, 1849; d. Nov. 24, 1940. He studied law in Paris as a young man and became acquainted with M. Clemenceau and he younger radicals of the Third Republic. He was for a time minister plenipotentiary to Germany and Austria-Hungary. For many years closely associated with the late Prince Ito, he succeeded the latter as leader of his party, became president of the House of Peers and of the privy council, minister of education and twice prime minister of Japan, 1906–08 and 1911–12. He was head of the Japanese delegation to the Paris Peace Conference.

SAIPAN. See MARIANAS ISLANDS.

SAIS, sā'ĭs, Egypt, in hieroglyphics SA, a ruined city on the Rosetta or Canopic branch of the Nile, 67 miles northwest of Cairo; site now occupied by the village of Sa-el-Hagar, or Sa of the Stone, which contains no remains of temples or palaces. It was an ancient religious capital, whose famous temple of the goddess of Neith contained the mysterious veiled statue, the subject of Schiller's ballad and of Novalis' romance. In Sais the fête of burning lamps was celebrated, attracting many foreigners; and here was a tomb of Osiris. Sais was also a renowned educational centre frequented by the Greek sages. It gave its name to two Egyptian dynasties, founded by natives of the city. The Saïti kings ruled Egypt for 150 years, until the country was invaded by the Persians under Cambyses. Consult Lepsius, 'Briefe' (p. 12); Wilkinson, 'Modern Egypt' (Vol. I, p. 183); Champollion, 'L Egypte' (Vol. II, p. 219); also Herodotus (II, 29, 59, 169), and Strabo (XVII, 801).

SAIVAS, sī'vaz, one of the three great divisions of the Hindu religion and meaning the worshippers of Siva. These are separated into sects which have varied in number at different periods in the religious history of Hindustan. The worship of Siva seems from a remote period more that of the learned and speculative classes than of the masses of the people. No poetic legends are recorded of this deity. Consult Wilson, 'Sketch of the Religious Sects of the Hindus' (1862); Monier-Williams, 'Religious Thought and Life in India' (1883); Barth, 'Religions of India' (trans., 1882).

SAJOU, same as SAPAJOU (q.v.).

SAJOUS, sa-zhoo', **Charles Eucharist de'Médicis,** American physician and author: b. at sea off France, 13 Dec. 1852; d. 27 Apr. 1929; was graduated from Jefferson Medical College, Philadelphia, in 1878, and was clinical lecturer there 1884–90; professor and dean of the medical faculty of the Medico-Chirurgical College 1898, and professor and president of the faculty of Temple University Medical School after 1909. He received the degrees of LL.D. from Saint Joseph College 1909, and Sc.D. from Temple University in 1915; was made officer of the Academy of France in 1889; Knight of the Legion of Honor of France in 1892; Knight of the Order of Leopold of Belgium in 1890. Dr. Sajous was Fellow of the American Philosophical Society and of the Academy of Natural Sciences and honorary and corresponding member of various foreign societies. He edited Sajous' *Annual* of the Universal Medical Sciences (45 vols., 1888–96); Sajous' 'Cyclopedia of Practical Medicine' (8 vols., 1896 et seq.); editor of the *New York Medical Journal* (1911–1919); was president of the American Medical Editors' Association 1903 and he wrote 'Diseases of the Nose and Throat' (1884) and 'The Internal Secretions and the Principles of Medicine' (1903–22). The latter work was the first to show that the ductless glands sustained life in the tissue cells and that they played a leading part in most diseases, as defensive organs.

SAKAI, sä'kī, Japan, on the southwest of the island of Hondo, seven miles south of Osaka. Before the rise of the latter town it was the chief commercial port of Japan. Osaka now monopolizes the trade. Pop. 105,009.

SAKHALIN, sä-gä-lēn', or **SAGHALIEN** (Japanese **KARAFUTO),** a long mountainous island in the north Pacific, opposite the mouth of the Amur River in Siberia. Its area contains 24,560 square miles. The Strait of La Pêrouse separates it on the south from Yezo, Japan, and the Sea of Okhotsk bounds its eastern and northern shores. The narrow and shallow Strait of Tartary separates it from the mainland. Mounts Bernijet and Ktöns-pal (2,000 to 5,000 feet) are the highest points of mountain ranges extending from north to south and interspersed with valleys of varying width. The principal rivers are the Tym and the Poronai, navigable for a short distance and teeming with fish, especially salmon. Petroleum and naphtha exist and coal is mined by Russian convicts. Agriculture does not succeed owing to the extremely rigorous climate. The island is covered with dense forests. Bears, tigers, sables and wild reindeer abound. Vegetation is Siberian in character. Sakhalin's history begins with the Stone Age, relics of which and of the Bronze Age are still extant, as seen in houses, bones and implements discovered. The island formerly belonged to the Chinese Empire, but early in the 19th century it was annexed by the Japanese who ceded it to Russia in 1875. By the Treaty of Portsmouth, N. H. (1905), following the Russo-Japanese War, the southern portion of the island was ceded to Japan by Russia, which retained the northern portion. The Japanese portion, which was known as Karafuto, had an area of 13,935 square miles and a population of 339,357; the Russian, an area of 10,625 square miles and a population of about 12,000. The massacre of over 350 Japanese in Nikolayevsk in 1920 was followed by seizure of the Russian portion by Japan, which did not evacuate southern Sakhalin until 1925, and was then granted important concessions in oil, timber, and fishing. On Sept. 2, 1945, Premier Joseph Stalin announced that southern Sakhalin would pass to the Soviet Union.

SAKHARA, säk-kä'rä, Egypt, the necropolis of Memphis, about two miles distant from the ruins of the ancient city on the confines of the Libyan Desert. The chief interest lies in its antiquities, tombs and catacombs. Many pyramids rise among its ruins, one of which is remarkable for its doorway of inlaid tiles, bearing a royal name. Mariette discovered numberless sarcophagi, catacombs of the sacred Ibis, tombs of the god Apis, numerous grottoes, etc. What is believed to be the oldest mummy in the world, that of a son of Pepi I of the 5th dynasty, probably over 6,000 years old, was discovered here.

SAKI, a South American monkey of the genera *Brachyurus, Pithecia* and related groups. Its marked peculiarities are a non-prehensile tail, covered with very long hair, round head, short muzzle, ears not unlike those of humans and long-hair covering of entire body. See MONKEY.

SAKI, sä'kē, or **SAKE,** the native beer and common stimulating drink of the Japanese. It is made from rice and is drunk warm, producing a very speedy but transient intoxication.

SAKIEH, säk'ĭ-ĕ, **SAKIA,** or **SAKEEYEH,** a machine used in Egypt for raising water from the Nile for the purpose of irrigation. It is a modification of the Persian wheel and consists of a series of cogged wheels, turned by a buffalo or camel, each revolution of the wheel working up a series of earthen pitchers which empty themselves into a trough or pool.

SAKTA, säk'ta, the designation in the Hindu religion of a worshipper of the Sakti, the power or energy of the divine nature personified in a female form. If the tendencies of the worshipper are toward the adoration of Vishnu, then the personified Sakti is termed Lakshmi or Maha-Lakshmi; if it be toward that of Siva, the Sakti is dominated Parvati Bhavani or Durga. At least three-fourths of the Hindus of Bengal are of this sect, and of the remaining fourth, three are Vaishnavas to one Saiva. Wilson divides the Saktas into Dakshinis, Vamis, Kancheliyas and Kararis. Another classification is into the Dakschinacharis and the Vamacharis, followers of the Right Hand and of the Left Hand Ritual. Consult 'Religious Sects of the Hindus' (1862, p. 32).

SAKUNTALA, sa-kun'ta-la. This masterpiece of Hindu literature is by Kalidâsa, the leading poet of India's second, or Sanscrit period. It is a drama in seven acts and the underlying theme as well as many of its details are derived from the Mahâbhârata, the great national epic of the Hindu race. There are a number of versions of Sakuntâla (also spelled Çakuntâla or Shakuntâla) extant, the Bengalee one coming closest to the original. The drama has also been fashioned for the use of the European stage by Wolzogen, Donsdorf and others. The story of the play runs as follows: King Dushanta weds Sakuntâla, the adopted daughter of the pious hermit Kama, but on her being brought to his court he fails to recognize her, owing to a curse having been pronounced against him. The despairing bride is translated to the realm of the genii, until finally the recovery of a ring, the pledge of mutual faith and love, leads to the reunion of the couple. The great charm of Sakuntâla lies in the descriptive powers displayed by the poet, his keen appreciation of the beauties of nature and of the seasonal changes; his wealth of words is marvelous; his phraseology is often brilliant and picturesque, and the sentiments expressed, particularly as to the master passion, love, are delicate and psychologically true. The action, however, drags and is overburdened with side issues, and the diction suffers from its excessive artificiality and verbosity. Added to these defects is a lack of the sense of proportion, such as the Greek genius possessed in so high a degree. Nevertheless, all authorities are agreed on the rare and dainty charm of Sakuntâla, and Goethe bestowed unqualified praise upon it. The exact time when the poet Kalidâsa lived and wrote this drama is shrouded in uncertainty. Indian tradition and authorities variously assign the time to the 3d century B.C. and up to the 6th century A.D. From strong internal evidence, particularly because of the extremely corrupted form of the Prakrit spoken in the play by the women and subsidiary characters, it is now concluded that the correct period must have been the 2d or 3d century A.D. Consult Schuyler, Montgomery, Editions and Translations of Çakuntâla (in American Oriental Society *Journal,* Vol. XXII, Boston 1901); Henry, V., 'Les littératures de l'Inde' (Paris 1904); Macdonell, A. A., 'History of Sanskrit Literature' (London 1913).

WOLF VON SCHIERBRAND.

SAL-AMMONIAC. See AMMONIA.

SAL-TREE, a valuable timber-tree of India (*Shorea robusta*) second in importance only to the teak. It is found in large forests along the base of the Himalayas and again in another belt in eastern India. It belongs to the order *Dipterocarpaceæ* and yields a hard, heavy dark-brown, close-grained wood which is very durable and highly valued, particularly for gun-carriages and railway ties. A whitish aromatic resin (saldammar) used to calk ships and also for incense (see DAMMAR) is obtained by tapping the trunk. The tusser silkworm feeds on the leaves. The sal forests are protected by the government of India.

SALA, George Augustus Henry, English journalist and author: b. London, 24 Nov. 1828; d. Brighton, Sussex, 8 Dec. 1895. He received some instruction in drawing, but at 15 was obliged to provide for himself. He was a theatrical scene painter for a time, then turned to etching and engraving and had some success as an illustrator. In 1848 he turned to literature and from 1851 to 1856 contributed regularly to *Household Words,* edited by Charles Dickens. His first experience as «special correspondent» was in the letters he wrote for this journal from Russia after the Crimean War. In 1863–64 he was in the United States reporting the Civil War for the *Daily Telegraph,* and later published 'My Diary in America in the Midst of the War.' He followed Napoleon III to Algiers and published as a result, 'A Trip to Barbary by a Roundabout Route' (1866). He established *Temple Bar,* a periodical which he edited from 1860 to 1866, and derived a large income from journalism, but much of his work is cheap and inflated, and no doubt was an important factor in the development of modern reprehensible newspaper methods. He wrote a critical biography

of William Hogarth (1860); and, in addition to works of travel already mentioned, 'America Revisited' (1882); 'A Journey due South' (1885); 'Right Round the World' (1888), works embodying his observations as a tourist and lecturer across the American continent to Australia and India.

SALAAM, sạ-läm', or **PEACE BE WITH YOU,** the common salutation among Mohammedans. The answer is, «On you be peace and the mercy of God and his blessings.» It is improper to address this answer to any but a believer.

SALAD PLANTS, various herbs whose tender, succulent foliage is eaten raw, with or without a dressing. In general, salads should be grown quickly and served as soon as possible after being gathered. They all delight in moist, rich soil with abundance of humus and nitrogenous plant food. Most of them may be sown as soon as the soil can be worked in spring, and some may be sown in autumn and allowed to remain until spring. Few do well in hot weather. Clean cultivation is essential with all of them, and since they are usually quick-growing plants, they are favorites for growing between the rows of later maturing plants, such as cabbage, peas, beets, etc., which are themselves used by market-gardeners in the same way, a later crop being put upon the land as soon as they are gathered. That is a crop of salads, one of cabbage and one of perhaps celery may be obtained from the same area in one season.

In America the most important salad is lettuce, which is extensively grown by truckers and market-gardeners, especially in the East from Florida to Massachusetts, the season starting in January in the South and advancing northward until June, the hot weather checking its production. In the autumn there is a less marked southerly migration. In the North large quantities are also grown under glass to supply local demands. Probably the endive ranks second as a market salad. Its consumption is, however, far less than that of lettuce, and it is less cultivated in the South than in the North, where the cooler climate is more suitable. As a home-salad mustard and cress are probably of next importance in America; in Europe they are grown in enormous quantities for the general market, but in America they are seldom offered for sale. Watercress is more important as a market salad and probably ranks next to endive. It is grown in streams or in damp ground, immense quantities being shipped to the Eastern markets from Virginia. Chicory and dandelion are both popular in the East, but probably more as pot-herbs than as salads. They usually require longer to attain edible size than lettuce and like endive are generally blanched. Chicory is occasionally used in the United States to make *barbe de capucin* and *witloof,* two salads very popular in Europe. The roots are dug in autumn, trimmed and for the former laid horizontally in pyramidal heaps with alternate layers of sand or soil in dark cellars and kept moist by occasional watering; for the second they are buried vertically and covered with some fermenting material for a few weeks. The former is the succulent leaf produced; the latter is a small head something like brussels sprouts. Either may be used as salad or as pot-herb.

SALADIN, săl'ạ-dĭn, or properly **SALAH-ED-DIN YUSSUF IBN-AYUD,** sultan of Egypt and Syria: b. Tekrit, 1137; d. Damascus, 3 March 1193. He entered the service of Nureddin, emir of Syria; became vizier in Egypt about 1169; suppressed the Fatimites in 1171; was proclaimed sultan in 1174 and conquered Damascus and Syria. The great object of his policy was to expel the Christians from Palestine, and recover the city of Jerusalem (see CRUSADES). An atrocious massacre of Mohammedan pilgrims by Chatillon added to his ardor; and his vow of revenge against the perpetrator he was enabled to make good by his famous victory on the plain of Tiberias in 1187, where he captured Guy de Lusignan, king of Jerusalem, Chatillon (whom he cut down after the battle with his own scimitar) and many more. The fruits of this victory was the towns of Acre, Said and Beyrout; after which he laid siege to Jerusalem, which yielded (1187) in a capitulation, to the articles of which Saladin faithfully adhered. He then proceeded against Tyre, but failed in consequence of the destruction of his fleet by the Franks. The intelligence of the loss of Jerusalem reaching Europe produced the Crusade under the Emperor Frederick Barbarossa (q.v.), whose death inspired Saladin with hopes soon damped by the arrival of the forces of Richard Cœur-de-Lion of England, and of Philip Augustus of France. The recovery of Acre by the two kings took place in 1191, upon which event Philip returned to France, and Richard, after twice defeating the sultan, took Cæsarea and Jaffa, and spread alarm as far as Jerusalem. At length a truce was concluded between Richard and Saladin (1192), by the terms of which the coast from Jaffa to Tyre was ceded to the Christians, while the rest of Palestine remained to the sultan. The departure of Richard freed Saladin from his most formidable foe. Though chargeable with unjustifiable means of acquiring power, Saladin employed it, when obtained, usefully for his subjects, whose burdens he lightened, while he benefited them by many useful works and establishments. Magnificent in his public undertakings, he was frugal in his personal expenses. He has been celebrated in Western literature for courage, moderation and justice. Scott introduces him into 'The Talisman,' disguised as the physician Adonbec and as Ilderim. Consult Gaston-Paris, 'La légende de Saladin' (Paris 1893); Reinaud, 'Notice sur la Vie de Saladin' (1874); Baha-ed-din, 'The Life of Saladin' (1897); Lane-Poole, 'Saladin, and the Fall of the Kingdom of Jerusalem' (1898); Yusuf ibn Rafi, 'The Life of Saladin' (tr. for Palestine Pilgrims' Text Society, London 1899).

SALADO, sä-lä'thō, a river of Argentina, rising in the eastern slopes of the Cordilleras, and emptying into the Paraná after a course of 750 miles. It is salty, hence the name.

SALAL, an evergreen shrub (*Gaultherio shallon*), of the northwestern United States, from 2 to 10 feet high, with dark-green leaves and reddish twigs, bearing racemes of flowers, succeeded in August by dark-purple fruit, «salal-berries,» of the size of buck-shot, rough on the outside, very juicy and of a sub-acid flavor.

SALAMANCA, săl-ạ-măn'ka, Mexico, a town in the state of Guanajuato, situated in the south-western corner of the state, on the rail-

road to Guadalajara. It lies in a wide, fertile but somewhat marshy plain. Among its seven churches one is a Gothic structure built on an ambitious plan. The chief industry of the town is the manufacture of porcelain. Pop. (1940) 11,985.

SALAMANCA, city, New York, in Cattaraugus County; altitude 1,380 feet; on the Allegheny River; about 65 miles southeast of Buffalo; on the Baltimore and Ohio; the Erie; and the Pennsylvania railroads; highways 17, 18 and 219, with bus connections to all parts. The business center of a dairy and farming region, its industries include furniture, last blocks, woolens, metal and plastic products. The city has an all-year vacation resort business; is near the Allegany State Park and is on the Allegany Indian Reservation. Its lease rentals are paid to the Seneca Nation. There is a Carnegie Library. Salamanca, originally the township of Bucktooth, was first settled in 1854, when a sawmill was established. In 1862 its name was changed in honor of the duke of Salamanca who helped finance the Atlantic and Great Western Railroad. In 1910 the city was granted a charter. It has a mayor and council government. Pop. (1940) 9,011; (1950) 8,850.

SALAMANCA, sä-lä-mäng'kä, Spain, (1) (ancient SALMANTICA, or HELMANTICA), capital of a province of the same name, in Old Castile, 107 miles northwest of Madrid, occupying three hills on the right bank of the Tormes River. The bridge across the river rests on 26 arches and is of Roman foundation. Its numerous and magnificent ecclesiastical and educational institutions have secured for Salamanca the title of "Little Rome." On the great plaza are the town house, post office, and stores. The Plaza Mayor is one of the finest squares in Europe, and is surrounded by an arcade supported by 90 Corinthian columns. The cathedral, begun in 1513, is a fine example of the florid Gothic, with an elaborate portal, lofty dome and graceful interior columns. There are also an old and massive cathedral of Norman-French style (1102), numerous other churches, and as many convents; the College of St. Bartholomew or Old College (1410), a classic building with an Ionic portico; College of Jesuits; that of the military order of Calatrava, College of the Archbishop (1522, by Fonseca), a colossal and sumptuous edifice with a fine facade and a chapel containing sculptures by Michelangelo; and St. Domingo, the largest convent. The University of Salamanca is one of the most venerable and celebrated in Europe (13th century), whose students once numbered 14,000, coming from all parts of the globe. The cloisters of the two buildings comprised in the university are remarkably elegant, with graceful arches and elaborate moldings. There are numerous other schools, a theater, bull arena, asylums, hospitals, handsome residences and palaces. The most distinguished of the latter are the palaces of the marquis of Valdecarzana and of the counts Garcigrande, Maldenadas, Espinosas and Monterey. There are manufactures of leather, blankets, hats and pottery. In ancient times Salmantica was an important city of the Vettones. In 222 B.C. it was taken by Hannibal, and later under the Goths was a favored city. It was ravaged by the Moors and retaken in 1095. Columbus was lodged (1484–1486) in the Dominican convent here. In 1543 Philip II was married to Mary of Portugal. In 1812 the duke of Wellington gained a victory over the French under Marmont. Pop. (1941 est.) 73,120.

(2) The province of Salamanca has an area of 4,829 square miles, the greater part of which is covered by forests of oak and chestnut. The principal rivers are the Tormes, Douro, Yeltes, Agueda, and the Alagon. There are good harvests of cereals, hemp, oil and wine. Gold is found in the streams, and iron, lead, copper, zinc and coal in the hills, but the mines are only partially developed. The manufactures are unimportant and mainly for home consumption. The cloth of Béjar is especially good. Tanning of hides is a considerable industry. The province is traversed by a railway to Portugal. Pop. (1941 est.) 392,915.

SALAMANDER, săl'ă-măn-dĕr, the name applied generally to the species of tailed amphibians (*Urodela*), but originally to the common European genus *Salamandra*. The smaller strictly aquatic species are known as newts or tritons; some of the larger species have received special names, as congo snake, hellbender, Siren, and water-dog. The remaining salamanders are terrestrial or semi-aquatic and only rarely remain permanently in the water. One Californian species (*Autodax lugubris*) is partly arboreal. They are of small size and lizard-like form; but the popular notion that they are lizards is altogether erroneous as they are strictly batrachian in structure and life-history. The skin is smooth, glandular and scaleless, the skull possesses a well-developed parasphenoid bone and two occipital condyles, and all, except a few terrestrial species, pass through an aquatic gill-breathing stage. Some of the larger aquatic species advance but little beyond this condition; but in the great majority it is larval only and is succeeded by an abranchiate and sexually mature state. The axoltl of the genus *Amblystoma,* is a remarkable instance of a sexually mature larva. Many adult salamanders breathe by means of lungs, but a recent noteworthy discovery is the total absence of lungs in a large proportion of species, in which respiration takes place partly in the skin, but especially by means of a special vascular area of the pharynx. Most of the species deposit their large eggs in water, sometimes in a mass of jelly, as *Amblystoma* (q.v.), sometimes separately or in strings, as *Spelerpes;* but others, like *Desmognathus fuscus* and *Plethodon,* seek drier places beneath stones and guard the eggs, and the terrestrial salamanders of Europe (*Salamandra*) are ovoviviparous. All are carnivorous and subsist upon insects, worms, etc. They are chiefly active at night, and during the day conceal themselves beneath stones and logs. During cold weather they pass into a more or less profound state of hibernation. Owing to the numerous cutaneous glands the skin is always moist and cold, from which arose the remarkable superstition that these animals, which as a matter of fact require abundant moisture to sustain life, have the power not only of resisting, but of quenching, fire. Pliny records that he tried the experiment, and the salamander was burned to a powder; yet the fable continued to be credited till very recent times. From this old belief the name is applied to many articles, and by the ancients to a mythical creature, having fire-resisting qualities. The cutaneous secretion is poisonous to

many of the lower animals. (For a classification of salamanders see URODELA; for development see EMBRYOLOGY). Consult Cope, 'Batrachia of North America' (Washington 1889); Gadow, 'Amphibia and Reptiles' (New York 1901); Phisalix-Picot, Mme., 'Recherches embryologiques, histologiques et physiologiques sur les glands à venin de la salamandre terrestre' (Paris 1900).

SALAMANDER, a kind of gopher (q.v.).

SALAMBA, the native Filipino name for a kind of fishing apparatus, used near Manila, fitted on a raft composed of several tiers of bamboos. It consists of rectangular net, two corners of which are attached to the upper extremities of two long bamboos, tied crosswise, their lower extremities being fastened to a bar on the raft, which acts as a hinge; a movable pole, arranged with a counterpoise as a sort of crane, supports the bamboos at the point of junction, and thus enables the fishermen to raise or depress the net at pleasure. The lower extremities of the net are guided by a cord, which, being drawn toward the raft at the same time that the long bamboos are elevated by the crane and counterpoise, only a small portion of the net remains in the water, and is easily cleared of its contents by means of a landing net.

SALAMIS, săl'a-mĭs, ancient **PITYOUSSA** (Island of Pines), modern **KOLURI,** an island off the coast of Greece, in the Gulf of Ægina, about 10 miles east of Athens. It covers an area of about 30 square miles; is of irregular shape and rocky surface, and separated from the mainland by narrow, winding channels, giving access to the beautiful Bay of Eleusis, which has the appearance of a lake. Its soil is well adapted to the olive, and vineyards thrive. The other chief product is honey. The old city of Salamis stood on the south coast, and the famous naval battle of 480 B.C., between the Greeks and Persians, soon after the great battle of Thermopylæ, was fought in the narrow eastern strait. The new city of Salamis is on the northeast coast. The principal town is Koluri. Solon and Euripides were natives of the old city.

SALAMMBO, să'läm-bō', by Gustave Flaubert, is an attempt to renew, in an age of science and according to the spirit of realism, the historical novel, which in its typical form as created by Walter Scott and practised by his numerous followers was an outgrowth of the romantic temper. It presents a reconstruction of the life of Carthage in the 3d century B.C., utilizing some of the events of the war of the Mercenaries against the Carthaginians as told by Polybius (Book I, last chapter). In preparation for his task he undertook a journey to the scene of his story, studied minutely the records and monuments of old Semitic civilization and sought patiently through familiar acquaintances with the present inhabitants of the region to discover in their life and character clues to the past. To those who impeached the accuracy of his picture he replied at length and in detail, citing authorities and warmly repelling all criticism that hinted either at ignorance or carelessness. But it is not for its erudition that the book has its fame, but for its art. Flaubert was first of all an artist, and if he took great pains to ensure truth in the matter of his work, he took even greater pains to clothe the material in a perfect garment of words. For him, as for all great stylists, there was but one perfect word and one perfect phrase in a given case, and he knew no peace nor rest till he had found it. Salammbô is not a moving tale of adventure, but a series of pictures, rich, full, vivid and exquisitely wrought, in a texture of words that caresses the ear. They have both an intellectual and a sensuous charm. But they are often violent, painful, abhorrent, leaving us oppressed with a sense of the cruelty and mockery of life in Flaubert's pessimistic vision of it. Sainte-Beuve devoted a series of articles to Salammbô in 'Nouveaux lundis' (Vol. V). Flaubert wrote a rejoinder that is to be found in current editions of the novel and in his 'Correspondence,' Vol. II. An English translation was made by M. French Sheldon (London 1886).

ARTHUR G. CANFIELD.

SALANDRA, sa-län'dra, **Antonio,** Italian statesman: b. Lucera, Apulia, 1853. For many years a professor of administrative law at the University of Rome, he entered Parliament as deputy for his native city and early became associated with Baron Sonnino (q.v.) in the «party of constitutional opposition» against the political degeneracy of «Giolittism.» After holding various posts in several cabinets Signor Salandra became Premier in March 1914 on the resignation of Giolitti. During the first months of his administration he was engaged in a severe struggle against the Parliamentary majority controlled by Giolitti. On the outbreak of the European War, Salandra refused the assistance of Italy to Germany and Austria on the ground that the Triple Alliance stipulated co-operation only in case of an attack. The Foreign Minister in his Cabinet, San Giuliano, inclined more toward the Central Powers or at least benevolent neutrality. Nor was the Foreign Minister the only member of the Cabinet to oppose the Premier's policy. With the support of Signor Martini, the Colonial Minister (and a sincere friend of France), Salandra succeeded in overcoming the opposition of his colleagues. He had correctly gauged the temper of the country and the disinclination of the army and navy to fight on the side of Austria. His hands were strengthened by the somewhat opportune death of San Giuliano in October 1914, which enabled him to invite his former chief, Baron Sonnino, to accept the portfolio of Foreign Affairs. Both were resolved from the beginning to cast in their lot with the Allies in due course, though it was necessary first to place the army on an efficient footing and to break the links of economic dependence which bound Italy to the principal partner of the alliance. While Prince von Bülow and other agents of the Central Powers were exerting themselves to influence Italian opinion, the government prepared for the breach. At the instigation of von Bülow the ex-Premier Giolitti endeavored to stir up the king and Parliament to support the German cause, and to bring about the fall of Salandra. These machinations were an open secret and only served to heighten public indignation against the conspirators. Salandra decided on a bold stroke. He tendered his resignation to the king on 13 May

1915. Italy was electrified; enthusiastic gatherings demanded "War or the Republic." It was openly expressed that the king would stake his crown if he yielded. Three days later came the news that Salandra's resignation was not accepted; the demonstrations ceased; Giolitti and the German agents left Rome, and 10 days later Italy declared war. He resigned in June 1916. He was a delegate at the Paris Peace Conference in 1919. He died Dec. 9, 1931.

SALANGANE, săl'ăng-gān, a small swift of the genus *Collocalia,* of southern Asia and neighboring islands, famous as the producer of the edible bird's nests.

SALARY GRAB, in American history, the popular name for the general increase in federal salaries in 1873. The Constitution provides for the compensation of the president, senators, representatives, justices, and federal officers from the federal treasury. The act of March 3, 1873, provided that the president's salary be increased from $25,000 to $50,000, that of the chief justice from $8,500 to $10,500, those of the vice president, cabinet officers, associate justices, and speaker of the House from $8,000 to $10,000, and of senators and representatives from $5,000 to $7,500.

Another act, March 4, 1873, was retroactive as regards the salaries of members of Congress during the previous two years. This, the essence of the "salary grab," excited so much indignation that the laws were repealed, except those affecting the salaries of the president and justices.

SALAWATTI, să-lä-wä't ē, a Melanesian island off the western coast of Netherlands New Guinea, off the northwestern extremity of Papua, from which it is separated by Galewo Strait, covers an area of about 670 square miles. A chain of chalk cliffs, rising to a height of 2,500 feet, skirts the northern coast; the remaining portion is a deep valley covered with virgin forests. Pop. (1930) 1,689.

SALAYAR, SALAJAR, or **SALEIJER,** island, Indonesia, off the southern coast of Celebes from which it is separated by Salayar Strait, 13 miles wide. Salayar is about 50 miles long by eight miles wide. Chief products are pepper, corn, and coconuts. Industries include fishing and salt production. The principal port of the island is Benteng. Pop. (1930) 59,937.

SALDANHA BAY, săl-dăn'yà, bay, South Africa, on the west coast of Cape Province, 60 miles north of Capetown, is a commercial port on the Atlantic, for the western territories of South Africa. It is chiefly of service in the coast trade, and of all the harbors of this seaboard is the only one affording shelter and anchorage at all seasons. It was formerly the chief Dutch naval station in South Africa. During World War II it served as a naval base.

SALE, George, English Oriental scholar: b. supposedly in Kent, about 1680; d. London, Nov. 13, 1736. Little is known of his life except that he was a solicitor in London, and at an early period turned his attention to the study of Arabic and other Oriental languages. In 1726 he began the publication of an Arabic translation of the New Testament for the Society for the Promotion of Christian Knowledge, and was for years engaged in the work of that association. He is best known by his admirable translation of the Koran in 1734, still highly esteemed. He was a contributor to the *Universal History* (1739).

SALE, Sir **Robert Henry,** English military officer: b. Buckden, Huntingdonshire, Sept. 19, 1782; d. Mudki, India, Dec. 18, 1845. He entered the army with an ensign's commission in 1795, was promoted lieutenant in 1797, and in 1798 was ordered to India. He was engaged at Seringapatam, and in 1810 took part in the expedition against Mauritius. In 1813 he was promoted major, and in 1815 he returned to England with his regiment. He served in the expedition against Burma in 1824; in 1838 became brevet colonel and was placed in command of a brigade in the army of the Indus. In the war with Afghanistan which followed Sale played an important part. He became major general in 1840; was in command of the army which stormed Khurd Kabul Pass in 1841 and defended Jelalabad in the siege of 1841–1842. He was knighted for his conduct at Kabul, received the thanks of Parliament for his services in the war, and the decoration of G.C.B. In the Sikh War he was wounded at the battle of Mudki, Dec. 15, 1845, and died three days later.

SALE, in law. See Sales.

SALEM, city, Illinois, Marion County seat; altitude 544 feet; 71 miles east of St. Louis, Mo.; on the Baltimore and Ohio; Chicago and Eastern Illinois railroads, and on the Missouri Illinois Railroad, of which it is a terminus. It is in an agricultural and coal mining region, and in 1939 was the center of an oil boom. It has railroad shops, and manufactures of shoes, underwear, pants, paint, insecticides and lumber. There is considerable trade in timber, dairy products, livestock and fruit. Pop. (1940) 7,319; (1950) 6,159.

SALEM, city, India, in Madras Province, capital of Salem district. It is well built, located in a narrow valley, and subject to sudden and frequent changes of temperature. It has important manufactories of cotton, silk, and cutlery. Mangoes, castor beans, sesame, and peanuts are grown. There are a municipal college, three printing presses, four reading rooms, and an English mission. Pop. (1941) 129,702.

SALEM, district, India, embraces 7,073 square miles and is very hilly, intersected by broad plains. The principal rivers are the Cauvery, with its numerous tributaries. The forests are valuable. Magnetic iron ore is abundant, and there are deposits of corundum and chromate of iron. The chief crops are millet, peanuts, castor beans, sesame, cotton, tobacco, and sugar cane. There are mango groves and mulberry farms. The Cauvery-Mettur hydroelectric and irrigation system furnishes power to the industrial center of Mettur and to the cotton-milling city of Salem. Other important towns are Dharmapuri and Hosur. Pop. (1951) 2,869,226.

SALEM, city, Indiana, county seat of Washington County; altitude 735 feet; 35 miles northwest of Louisville, Kentucky; served by the Monon Railroad, and state highways. It is a productive agricultural community. The first

white settlers came to the county in 1803, and Salem was founded in 1814. It was incorporated as a town in 1854, and as a city in 1936. Government is by city-mayor. Salem is the birthplace of John Hay, secretary of state under Presidents McKinley and T. Roosevelt Pop. (1950) 3,271.

SALEM, city, Massachusetts, one of the three seats of Essex County, is situated at an altitude of 13 feet on a peninsula formed by two outlets of the Atlantic Ocean. It is 16 miles northeast of Boston, and is served by the Boston and Maine Railroad. It is a port of entry, and a United States Coast Guard Air Station is located there. The city has a coastal trade in coal and oil. Manufactures are important and include electric lamps, radio tubes, fine cotton goods, shoes and other leather products, steam valves, chemicals, and mattresses. Several of its earliest colonial houses still stand, among which are the Corwin, or "Witch" House, and the birthplace of Timothy Pickering, built in 1660. Other points of interest are the old courthouse, where the records of the witchcraft trials are preserved; the Pierce-Nichols House, the House of the Seven Gables, the old town hall, and the Salem Athenaeum. The Essex Institute contains a large library, valuable historical collection of relics of colonial days and the witchcraft craze, and a fine collection of old furniture and works of art. The Peabody Museum contains an almost complete Essex County natural history collection, ethnological collections, and models and pictures of ships built in Salem. The city has a public library, 16 public schools, and Catholic parochial schools.

Salem was founded in 1626 by Roger Conant and chartered in 1629, with John Endecott as governor. The Pilgrim church was organized Aug. 6, 1629, with Samuel Skelton as pastor and Francis Higginson as teacher. In 1634, Roger Williams was the minister, but was driven out in 1636. In 1692, witchcraft hysteria broke out there. (See WITCHCRAFT.) In 1774, the first provincial assembly, held there, declared for the independence of the Massachusetts colony; and in 1775, British troops were prevented from crossing the North Bridge in their search for arms and ammunition. Salem furnished more than 150 armed privateers during the Revolutionary War. For a time thereafter, vessels were restricted to coastwise trade; but soon world markets were opened, and at one time as many as 34 Salem ships were engaged in the China trade. The opening of the Erie Canal drew the foreign trade to New York, and Salem's shipping glory vanished. Salem was incorporated as a city in 1836. The city government is vested in a mayor and 11 councillors. Pop. (1950) 41,842.

SALEM, city, New Jersey, seat of Salem County, is situated at an altitude of 16 feet on the navigable Salem Creek near its confluence with the Delaware River. It lies 39 miles southwest of Camden, and is on the Pennsylvania Railroad and modern highways. Its manufactures include canned food products, glass, and floor coverings. It was founded as a Quaker colony by John Fenwick in 1675. The Friends Burial Grounds date from 1676. The Friends Meeting House, still in use, was built in 1772; and the public library was established in 1804. Salem was incorporated as a village in 1695, and as a city in 1858. It has a mayor-council government. Pop. (1950) 9,077.

SALEM, city, Ohio, located in Columbiana County, at an altitude of 1,230 feet; 69 miles southeast of Cleveland, on the Pennsylvania Railroad and modern highways. Its manufactures include automobile bodies, china and porcelain products, machinery and machine parts, and electric furnaces. It has a public library. An attractive residential city, founded by Quakers from Salem, N. J., in 1806, it was incorporated as a village in 1830 and as a city in 1887. It has a mayor-council government. Pop. (1940) 12,301; (1950) 12,683.

SALEM, sā'lĕm, city, Oregon, is the capital of the state and seat of Marion County. It is situated in northwestern Oregon on the east bank of the navigable Willamette River, about 50 miles (by highway) southwest of Portland. Salem lies at an altitude of 171 feet, is traversed by two creeks, and embraces an area of more than nine square miles.

Transportation.—The city is served by the Southern Pacific Railroad, Oregon Electric Railways, and a number of motorbus and truck lines. For air transportation of passengers, express, and freight, United Air Lines serves McNary Field, Salem's municipally owned airport.

Industry and Business.—Salem lies near the center of the fertile Willamette Valley which yields to rolling hills, and timbered uplands. It is the chief marketing center and distribution point for Marion and Polk counties, whose adjoining boundary line it overstrides. Among their leading crops are filberts, hops, vetch, long fiber flax, berries, and orchard fruits. The production of livestock and of seed, mushrooms, and other specialty crops, is also important. Salem has a dozen large canneries, quick freeze and cold storage plants, and plants for processing meat, feed, seed, and nuts. Textile mills manufacture such products as rugs, linen cloth, mops, insulation materials, and twine. Other manufactures are wooden boxes, furniture, and novelties; pulp and paper products, and machinery and metal products.

Government.—The city government is the council-manager type. The mayor and councilmen are elected on nonpartisan ballots. In addition to the airport, the sewage treatment plant and the waterworks are owned and operated by the city.

Educational, Cultural, and Recreational Facilities.—Besides the city's public elementary and high schools, other educational facilities include parochial schools, the Sacred Heart Academy (Catholic, coeducational) and Salem Bible Academy (coeducational and nondenominational), Willamette University (the oldest institution of higher learning in the Pacific Northwest); and the state schools for the blind, the deaf, the feebleminded, and the Hillcrest (state) Industrial School for Girls. The city has 54 churches in which 37 denominations are represented. The Salem Public Library contains nearly 60,000 vollumes; and the Oregon State Library has a large collection of photographs, books, pamphlets, and documents, among which is a special historical collection. Willamette University houses the Northwest History Collection of valuable historical manuscripts and documents, and collections of Indian relics, flora, fauna, and minerals. The city has several parks. The smallest is but 150 square feet and contains a single sequoia tree, planted in 1872; the largest (Bush Pasture

Park) covers 100 acres of land and has within it recreational facilities for children, and McCullough Stadium which is used by the university. On the capitol grounds and adjoining Wilson Park are more than 400 varieties of trees, many of historic interest. Salem has a ball park seating 5,500 people.

Buildings and Other Points of Interest.—The Oregon State capitol (1938) is an unusually striking and harmonious building of white Vermont marble in modern design, of which Francis Keally was the architect. Its cylindrical dome is surmounted by *The Pioneer,* a sculptured figure in heroic size by Ulric Ellerhusen. Near the entrance of the capitol is Alexander Phimister Proctor's bronze statue, the *Circuit Rider,* a memorial to Robert Booth, one of the itinerant preachers who served Oregon's pioneer settlements. Within the capitol, the history of the state is depicted in murals by Barry Faulkner and Frank H. Schwartz. The Oregon State Library is also modern in style. Gabriel Lavare executed the wood carvings of historical scenes over its three entrance doors, and also a decorative medallion (*Mother and Child*) in the lobby. The Oregon Public Service Building, completed in 1950 at a cost of $2,000,000, is a simple, five-story set-back structure finished in marble like that of the capitol, to which it is connected by underground tunnels. The oldest building still standing was once the home of Jason Lee.

History.—In 1833, Jason Lee was chosen in the East by the missionary society of the Methodist Episcopal Church to head a group for the conversion of the Flathead Indians north of the Columbia River. Arriving at Fort Vancouver, he was persuaded to locate in safer country. The following year he established a mission station and school north of the present city of Salem; but the site proved unhealthful, and in 1840 it was moved 12 miles to the south. That year, along a creek in what is now within Salem's boundaries, the missionaries set up a sawmill and gristmill. The following year (1841), they erected a building to serve as an Indian manual training school on what is now the university campus. Lee died in 1845. Christianizing the Indians began to be regarded as hopeless. In 1846, one of the missionaries was authorized to establish a townsite on the land; and in 1848, a town was laid out and lots were bartered for wheat. Growth was slow, the gold rush of 1849 diverting immigration from Oregon and even drawing off many of the people who had settled in and around Salem. In 1851, the legislature voted to make Salem the Oregon territorial capital. In 1852, only about a half dozen families were living there. In 1855 its newly erected capitol was destroyed by fire. Nevertheless, Salem was beginning to grow and prosper. In the 1850's it was connected with other settlements in the valley by stage, river steamer, and telegraph, and the first woolen mill in Oregon was opened there. Salem was incorporated as a city in 1860, and was made the permanent capital of the state four years later. In 1861, however, its development was halted by a disastrous flood, and not until after the railroad reached it in 1871 did growth begin again. In Salem there are reminders of its pioneers, as, for example, in the university which started as the Oregon Institute and traces its history back to 1842; but much of the characteristics and growth of the present city date from the 1900's.

Population.—In 1870, Salem's population was 1,139. The following figures indicate its growth in the 1900's: (1900) 4,258; (1920) 17,679; (1940) 30,908; (1950) 43,140.

SALEM, town, Virginia, is the seat of Roanoke County. It lies at an altitude of 1,076 feet, on the Roanoke River, in the Blue Ridge Mountains, 7 miles west of Roanoke. It is on the Norfolk and Western and the Virginian railroads, and state and federal highways. It is an established summer resort, and manufactures machinery, medicines, elevators, brick, clothing, and furniture. In it are Roanoke College, the Lutheran Orphanage Home of the South, and the Baptist Orphanage of Virginia. It was founded by James Simpson in 1802 on land from a grant made to Gen. Andrew Lewis in 1761. Government is by council and manager. Pop. (1950) 6,823.

SALEMI, city, Sicily, in the Province of Trapini. Elevation, 1,450 feet. It contains the ruins of an old castle, and a library and technical school. There is trade in cattle, grain, wine, and oil. Pop. 17,308.

SALEP, a demulcent drug, consisting of the tubers of certain orchids (*Orchis mascula* and *O. morio*). These tubers are prepared in central and southern Europe and in the Levant. They are dug up as soon as the flower stalks decay, and are dried. Otaheite, or Tahiti, salep is a starch made from the *Tacca pinnatifida* in the Pacific islands.

SALERATUS, aerated salt; originally potassium bicarbonate, an imperfectly carbonated salt. The name is now commonly applied to sodium bicarbonate, which is used to neutralize acidity and for raising dough. It is a common constituent of baking powders.

SALERNO, sä-lûr'nō (Ital. sä-lĕr'nô), Italy, (1) seaport and capital of the Province of Salerno, 32 miles southeast of Naples. It stands upon a slope whose summit is crowned by the ruins of an ancient citadel, and is surrounded by a massive stone wall. The streets are lava-paved. A cathedral (1076) of Gothic architecture is adorned with a portico of porphyry and Corinthian pillars from Paestum, the ruins of which are nearby. Here are the tombs of Margaret of Anjou and Gregory VII. Other edifices are the governor's palace, hospitals, churches, convents, a seminary, and a lyceum. The chief industries are cotton and silk spinning and printing. Among manufactures are glass, ceramics, macaroni, iron and leather goods, thread, and linen. Founded by the Greeks, Salerno became an important city under the Romans, passing into possession of the Goths, the Lombards, and the Normans successively. Of the ancient city of Salernum are still to be seen temples, an amphitheater, and a theater. In the medieval period, it was celebrated for its school of medicine. It was annexed to the kingdom of Naples in the 1800's. Pop. (1948) 67,009. (2) The province has an area of 1,901 square miles. It is in southern Campania on the Tyrrhenian Sea. In it, the chief spurs of the Apennines are the Cervati, Polveracchi, Alburno, and Sacro; its principal streams, the Tusciano, Mingardo, and Alerto. Its chief products are wheat, corn, flax, olives, figs, wine, and fruit. Pop. (1936) 705,277. (3) The Gulf

of Salerno, or Gulf of Pæstum, is a semi-circular indentation of the Mediterranean Sea, separated from the Bay of Naples by Point Campanellas. On its shores stand the picturesque and interesting towns of Amalfi and Salerno and the ruins of ancient Pæstum (q.v.).

SALERNO, School of (*Schola Salernitana*), a medical school at Salerno, Italy, famous in the Middle Ages, and important not so much for its contributions to medical knowledge as for its services in retaining the knowledge already possessed, through a period when all branches of learning were suffering decline, and forming a connection between ancient and modern medicine. As early as the 7th century some of the prelates of the Benedictine monastery at Salerno were famous for medical as well as other learning; but the school, or group of schools of medicine, which came into existence at Salerno was secular in character, the wives and daughters of the professors were often deeply learned and acted as teachers, and law and philosophy were taught as well as medicine. The school was at the height of its glory from the 9th to the 13th centuries; but from that time its decline was steady, owing to the more rapid advancement of other schools. At the zenith of the school's fame the city was known as *Civitas Hippocrates,* and it attracted many famous personages, among them William of Normandy, later Conqueror of England. The teachings of the school are fairly represented by existing works, but these are chiefly compilations founded on the teachings of Hippocrates and Galen. Such advances in knowledge as the school made were those of practical experience; and while a considerable knowledge of drugs was possessed at Salerno the treatment administered was in the main dietic. Anatomy they disregarded almost wholly. The medical school was dissolved by an edict of Napoleon in 1811, and the other departments closed in 1817.

SALES, sālz or säl, **Saint Francis de.** See Francis de Sales, Saint.

SALES. A sale is a contract by which property is transferred for a price in money. Usually the term is restricted to the sale of personal property. A sale is differentiated from other transfers of property by the fact that it is of the general or absolute ownership and by the further fact that it is for a price. A contract to sell, also called an executory contract of sale, is a contract by which the seller is to transfer property to the buyer for a price which the latter pays or agrees to pay. A contract of sale may be absolute or conditional.

To constitute a valid sale, there must be, as in all contracts, competent parties and mutual consent. In addition, there must be a subject matter to be sold and a price or consideration in money. If the price exceeds a specified amount, the contract of sale, to comply with the Statute of Frauds, must generally be in writing unless there is a part payment or some of the goods are delivered and accepted. A contract for the sale of goods not yet acquired by the seller is construed to be a contract to sell. If parties agree upon a sale, but do not fix the price, the law implies a reasonable price. The acceptance of an offer to buy or sell may be expressed or implied. Many questions of real difficulty arise in the law as to when title passes to the buyer, and the determination of the question is important in the law of insurance, liens, etc. Where a contract of sale provides that the buyer may return the goods or pay the price, the property in the goods ordinarily passes to the buyer subject only to a defeasance by the return of the goods. Under a completed sale of goods the title passes from the seller to the buyer immediately, at the place where the contract is completed. The intention of the parties controls if the sale is of specific or ascertained goods and this may be shown either by circumstances or declarations. If by the terms of the agreement any condition is to be performed or any material act to be done, as to identify the goods, the title generally does not pass until such act is performed. A sale on trial or approval is held to be a sale upon a condition precedent and the contract is executory, the title passing only after the buyer has accepted the goods.

Conditions are distinguished from warranties generally in that the former constitute the basis of the contract on a breach of which the parties may treat the contract as terminated, whereas a warranty is merely a collateral undertaking. Warranties are of two kinds: express and implied. Formerly the harsh rule of *caveat emptor* was applied to sales, but to-day the law protects the buyer by implying various warranties in contracts of sale. Generally speaking, an implied warranty arises on sales as to merchantability, title, fitness for purpose intended and that the goods shall fill the requirements of the contract, but not as to quantity, quality or value. See Contract; Warranty.

The law of sales in England and Ireland has been much simplified by the Sale of Goods Act, passed in 1893. The law of Scotland differs somewhat from that of England as to distinctions between conditions and warranties and as to the application of the Statute of Frauds in relation to sales.

An effort has recently been made in the United States to simplify the law of sales by codification, and up to June 1917 this effort had met with substantial success by the enactment of the Uniform Sales Act in no less than 18 States of the Union.

Edward F. Donovan.

SALESIAN FATHERS. See Orders, Religious.

SALESMANSHIP, The Psychology of. The salesman like the advertiser must influence the minds of men. He must influence men to buy goods and to buy his particular goods. Serving in such a capacity a knowledge of the fundamental principles of psychology will generally add to his effectiveness. He, too, must know when and how to make use of argument, when to appeal to this motive and when to that one. He must know that in most acts of deliberation there is a point when the occurrence of an apparently insignificant idea will swing a possible customer to favorable or unfavorable action and he must respond to that situation with the suggestive word destined to close his sale.

That the sales world recognizes the importance of psychological knowledge as a part of each salesman's equipment is clearly shown

by the increasing number of books and articles intended to show how psychological fact may be used in increasing selling efficiency. Besides this there are growing up all over the country public and private sales schools and sales schools conducted by business organizations for their employees, all of which are teaching with varying degrees of success a new science of salesmanship which has as its basis the elementary principles of psychology.

The opinion is also spreading that not alone the salesman but also the man who employs him, needs psychological knowledge. The modern salesman is frequently given a thorough course of training before he is sent out to visit the customers of his firm or possible customers of his firm. Now modern educational methods rest upon a distinctly psychological basis, so he who would train men in a sales school must, like any other teacher, familiarize himself with educational psychology in certain aspects, at least, if he would make the most of the training period of his men.

Then there is another highly important application of psychology to the problems of the selling organization. The methods of selecting the sales force have been and are still in many instances of a surprisingly hit or miss character. As a new development, psychologists are being called in by certain progressive concerns to standardize their methods of selecting men. While the science of mental measurement is still in a comparatively undeveloped stage, certain facts regarding a man can be determined, with a fair degree of accuracy, by means of mental tests. For example, mental tests will give a strong indication of the general native intelligence of a man. This fact alone will not of course give complete information as to the selling ability of an applicant, but, all things considered, the greater native intelligence a man has the more likely he is to succeed in a selling position. So, when taken as additional information about an applicant, the information secured from such tests is highly valuable.

Psychological investigations into the problems of character traits, the judgment of such traits and their bearing upon specific lines of work are bringing out further results of great utility for the sales manager. In short, the sales organization, like all other organizations so intimately concerned with the modes of human thought and action and with the differences which we know exist between one man and his neighbor, is sure to reap increasing benefits from the modern efforts of psychologists to work out practical solutions for the problems of the human failures and misfits.

WALTER DILL SCOTT,
President Emeritus, Northwestern University, Evanston, Illinois.

SALFORD, sôl'fĕrd, city and county borough, England, in Lancashire, on the Irwell River, which separates it from Manchester. On the Manchester Ship Canal, it has important docks. It is a large industrial town, closely associated with Manchester, and is a textile center for cotton manufacturing. Steel, shoes, automobile tires, chemicals, dyes, and soap are produced. The borough includes Trafford Park, an experimental industrial area founded in the 1930's. Pop. (1951) 178,036.

SALGIR, sŭl-gĕr', river, Russia, longest in the Crimea. The Salgir rises seven miles northwest of Alushta in the Chatyr-Dag, passes Simferopol and Nizhnegorski and, at the end of a 100-mile course, empties into Sivash, a salt lagoon.

SALGOTARJAN, shŏl'gō-tŏr-yän, city, Hungary, 53 miles northeast of Budapest on a branch of the Zagyva River. One of the leading coal and lignite mining centers, it also has important manufactures. Pop. (1941) 20,318.

SALIC LAW, să'lĭk, originally a penal code of the Salian tribes, later a name given to a rule excluding women from inheriting the crown of France. This Frankish tribe founded the French monarchy in the 5th century, but did not exclude women from the crown, only from inheriting land. The Salic laws were familiar to Charlemagne, who had them emended in the 9th century. The "Salic law" was first confirmed by France as a law of regal descent when Louis X (r. 1314–1316) died without a male heir and his brother Philip V (r. 1316–1322) was proclaimed king by the Assembly. The law was adopted by Spain in the time of Philip V (r. 1700–1746) and led to a revolt by the Carlists when the Cortes set aside the law to make Isabella II queen (r. 1833–1870). The German states also had this law and when Queen Victoria ascended the English throne (1837) it involved the separation of Hannover from England.

SALICORNIA, săl-ĭ-kôr'nĭ-ă, plant, genus of the Chenopodiaceae family, growing in saline soils. It is a succulent herb, so brittle as to be called glasswort, and grows over such large areas of marsh lands that when its usual green hue turns to red in the autumn it forms great patches of brilliant color. The common name is marsh samphire.

SALICYLIC, săl-ĭ-sĭl'ĭk, **ACID AND RELATED COMPOUNDS.** Salicylic acid is orthohydroxybenzoic acid, $C_6H_4(OH)(CO_2H)$. It occurs as the free acid in the plant known as meadowsweet (*Spiraea ulmaria*) and as its methyl ester in oil of wintergreen. The glucoside, salicin, may be broken down into glucose and saligenin (orthohydroxybenzyl alcohol), the latter yielding salicylic acid on oxidation.

Salicylic acid is a white crystalline solid melting between 156° and 159°C. It is sparingly soluble in water but quite soluble in alcohol and ether.

This acid is produced commercially from phenol (carbolic acid), caustic soda, and carbon dioxide. Phenol is converted first to sodium phenate in a hot solution of sodium hydroxide. The phenate is dried and heated with carbon dioxide under pressure. The resulting sodium salicylate is dissolved in water and color is removed by activated carbon, after which the acid is liberated by hydrochloric acid.

Salicylic acid is an antiseptic and disinfectant, particularly in ointments. It is quite effective against fungi. Its use is now generally prohibited in foods. Salicylic acid is employed mainly in the manufacture of dyes, pharmaceuticals, and fine chemicals.

Sodium Salicylate is classed as an analgesic and antipyretic, and is also an antiseptic and an intermediate in chemical synthesis. Its annual production is of the order of 800,000 pounds per year.

Methyl Salicylate, $C_6H_4(OH)(CO_2CH_3)$, occurs naturally as "oil of wintergreen," but is generally obtained by the action of methanol on salicylic acid. It is used in pharmaceuticals and mainly as a flavoring agent. Around 2,500,000 pounds of this chemical are made yearly.

Phenyl Salicylate, $C_6H_4(OH)(CO_2C_6H_5)$, is also known as salol. It is a white crystalline solid melting at 43°C. and sparingly soluble in water. Once employed as a medicinal, it is now primarily a commercial chemical, functioning as a preservative and plasticizer in vinyl and cellulosic ester plastics. Its value as a pharmaceutical was once considered to lie in its property of passing through the stomach and later dissolving in the small intestine, where it broke up into salicylic acid and phenol. Small amounts of it were also employed in coating enteric pills because of this same property of delayed solubility. It has been replaced by less irritating and more dependable drugs. It finds limited use in sun creams because it is relatively impenetrable by ultraviolet, and it is also an ingredient along with a plastic in a volatile liquid, a thin waterproof protective layer being formed over minor cuts and abrasions on evaporation of the solvent.

Acetylsalicylic Acid, $C_6H_4(O_2C\text{-}CH_3)(CO_2H)$, known to the general public as *aspirin,* is probably the largest single outlet for salicylic acid. The term is derived from an old name for the free acid, which was originally obtained from spiraea. Aspirin is made by the action of acetic anhydride and acetic acid on salicylic acid.

Other organic compounds related to salicylic acid are as follows.

Salicin, a naturally occurring glucoside, which breaks up into orthohydroxybenzyl alcohol and glucose.

Saligenin, $C_6H_4(OH)(CH_2OH)$, or orthohydroxybenzyl alcohol, is used as a medicinal and is also regarded as being formed in the first step in the manufacture of plastics from phenol and formaldehyde.

Salicylaldehyde, $C_6H_4(OH)(CHO)$ is made by the action of chloroform and caustic soda or phenol. It is used in organic synthesis, and as an analytical reagent.

Salicylamide, $C_6H_4(OH)(CONH_2)$, is an external antiseptic and fungicide in soaps, salves, and lotions.

W. T. Read.

SALIDA, sȧ-lī'dȧ, city, Colorado, and Chaffee County seat; altitude 7,050 feet; 96 miles northwest of Pueblo; on the Denver and Rio Grande Western Railroad. It is the center of a mining region where gold, silver, and lead are the principal ores. A railroad division point, it has railroad shops; granite finishing, creosoting, and the working of sheet metal are other industries. Agriculture in the surrounding area includes dairy and poultry farming and the growing of grains. Medicinal hot springs in the near-by mountains have made the city known as a health resort.

Salida is in the heart of the Rocky Mountains and has some of the finest mountain scenery in the West; on one side is the crest of the Continental Divide, and on the other the Sangre de Cristo Range. Salida was established by the Denver and Rio Grande Railroad in 1880, and the railroad maintains a modern hospital in the city. Pop. (1950) 4,553.

SALII, sā'lī-ī, priests of Mars in ancient Rome, so called from the Latin word *salire,* to leap and dance. Numa fixed their number at 12; Tullus Hostilius added another 12, who were called Salii Collini. Their origin is thus accounted for by the Romans: In the time of Numa, Rome was desolated by a pestilence, which ceased when the gods let fall from heaven the "ancile" (a shield of a peculiar form). The soothsayers declared that this shield was the sign of the perpetuity of the Roman power, and advised that 11 others should be made similar to it, so that the true ancile could not be so easily purloined. This advice was followed. On the 1st of March every year when the Salii offered sacrifices to Mars they carried the shields about the city, clashing them together, executing warlike dances and singing the Salian hymns—ancient songs in praise of Mars and the other gods, and of distinguished men, particularly of Mamurius, who made the 11 shields. The dress of the Salii was a purple tunic embroidered with gold, and bound with a brazen belt, and a toga with a purple border. On their head they wore a high cap in the form of a cone, with a sword by their side, a spear or rod in their right hand and an ancile in their left. None but patrician youths whose parents were alive could be admitted among the Salii.

SALINA, sȧ-lī'nȧ, city, Kansas, and Saline County seat; altitude 1,220 feet; on the Smoky Hill River; 119 miles west of Topeka; on the Union Pacific; Missouri Pacific; Atchison, Topeka and Santa Fe; and the Chicago, Rock Island and Pacific railroads. There is a municipal airport. Salina is the metropolis of the Kansas hard wheat region. Flour milling and the processing and packing of foods are foremost among the city's industries. Manufactures include farm implements, cement, bricks, canvas, tiles and foundry products.

Salina has a public library and a county historical museum, and is the seat of Kansas Wesleyan University (q.v.), coeducational, with library and museum; of Marymount College, Catholic, for girls; and of a military school for boys. The municipal auditorium is a war memorial, accommodating more than 3,000 persons. An art association contributes to the cultural assets of the community. Saline County was organized and settlement at Salina was effectively begun in 1859. After the Civil War came the railroads and the beginning of the modern development of the city. It has commission government, with city manager. Pop. (1950) 26,176.

SALINA CRUZ, Pacific seaport, Mexico, in the State of Oaxaca, 12 miles south of Tehuantepec, on the Tehuantepec Railroad, of which it is the southern terminal. It has a fine harbor and steamship connection with many foreign countries. Pop. (1950) 8,243.

SALINA FORMATION, or **SALINA STAGE,** in North American geology an important group of beds, belonging to the upper part of the Silurian series, named from a township in Onondaga County, New York, where salt springs, issuing from this formation, were discovered in the 17th century by the Jesuit missionaries. The formation, which consists mainly of shales, with frequently extensive salt and gypsum beds, comes to the surface in an east and west belt extending from Herkimer County, New York, westward across the Niagara River into Canada. Its erosion has caused a belt of low, often swampy, country, averaging from 8 to 15 miles in width, which is followed by the Erie (New York State Barge) Canal and the New

York Central and other railroads. The formation extends across Canada, where its outcrop is chiefly drift-covered, into Michigan.

SALINAN, sä-lē'nän, **INDIANS,** a linguistic family of North American Indians formerly inhabiting parts of San Luis Obispo, Monterey, and San Benito counties, California. The stock is now represented by only a score of individuals.

SALINAS, city, California, situated in the central region of California 9 miles from Monterey Bay in the 100-mile long Salinas River Valley. It is the county sea of Monterey County, and lies between the Gabilan and Santa Lucia Mountains. It is served by the Southern Pacific Railway and the Pacific Greyhound Lines.

The Salinas Valley is one of the richest agricultural regions in the United States. Its principal crops are lettuce, broccoli, celery, artichokes, sugar beets and dried beans. It is the center of a large bulb and seed industry. Salinas was settled in 1858, became the county seat of Monterey County in 1872, and was incorporated as a city in 1874. The famous California rodeo is held in Salinas each year. Pop. (1950) 16,283.

SALINAS, river in western California. It rises in San Luis Obispo County and flows northwesterly 150 miles to enter Monterey Bay.

SALIS, zä'lĭs, **Johann Gaudenz,** Baron von Salis-Seewis, Swiss soldier and poet: b. Bothmar Castle, near Malans, Grison, Dec. 26, 1762; d. there, Jan. 29, 1834. Going to France he joined the Swiss Guards (1779) and was adjutant to Masséna during the Revolution. Influential in Swiss politics after 1793, he was inspector general of the army, 1798–1817. His collected poems *Gedichte* (1793) achieved wide popularity.

SALISBURY, Robert Arthur Talbot Gascoyne-Cecil, 3d Marquis of. See Cecil.

SALISBURY, sôlz'bĕr-ĭ, **Rollin D.,** American geologist: b. Spring Prairie, Wis., Aug. 17, 1858; d. Chicago, Ill., Aug. 15, 1922. From 1892 he was professor of geographic geology at the University of Chicago. He was recognized as an authority on glacial and Pleistocene deposits. With Thomas Chrowder Chamberlin he wrote *General Treatise on Geology* (1906).

SALISBURY, town, Connecticut, in Litchfield County on the borders of New York and Massachusetts; there is freight service on the New York, New Haven and Hartford Railroad. It is a center for winter sports and summer music festivals. The first tax-supported library in the United States is that at Salisbury, which was organized in 1803 from one established by the Library Association in 1771. The town was settled in 1719 and incorporated in 1741. From 1732 until the end of the 18th century it was an important iron-mining center. Pop. (1940) 3,030; (1950) 3,076.

SALISBURY, city, Maryland, geographical and business center of the Delmarva Peninsula which lies between Chesapeake Bay and the Atlantic Ocean, 103 miles south of Wilmington, Delaware, on the Pennsylvania Railroad. It is the county seat of Wicomico County, altitude 23 feet. Salisbury is in a rich agricultural region which is also the largest poultry (broiler) raising section of the world. Commercial crops include extensive shipments of strawberries, cucumbers, cantaloupes, white and sweet potatoes, and other fruits and vegetables. Most important manufacturing establishments engage in production of frozen and canned foods, gasoline pumps, apparel, furnace and foundry products, fish fertilizer, bricks, building materials. A state teachers college is here. Salisbury was founded in 1732 by act of the Provincial Assembly of Maryland. Pop. (1950) 15,109; (including suburbs) 18,000.

SALISBURY, city, North Carolina, Rowan County seat; altitude 764 feet; located 42 miles from Charlotte, 40 miles from Winston-Salem, on important federal and state routes. Served by main line of Southern Railway; location of largest less-than-carload freight shipping center in Southeastern states. The economy is highly industrialized, with more than 100 diversified plants in the community. Crops are diversified, dairying is a leading activity. The city has two colleges, Catawba for white, and Livingstone for colored students.

Founded in 1753, the city was named for Salisbury, England. Adjacent to Salisbury's city limits are the incorporated towns of Spencer and East Spencer, the three municipalities having a combined population of 25,676 (1950).

SALISBURY, capital of Southern Rhodesia, southeast Africa, in Mashonaland Province 240 miles northeast of Bulawayo. Fort Salisbury, in the vicinity, was built in 1890, and the municipality was created in 1897. Salisbury is the center for a number of gold fields and for a rich agricultural and stock raising region. Pop. (1946) 69,100.

SALISBURY or **NEW SARUM,** sâr'ŭm, municipal borough, England, in Wiltshire, on the Avon 22 miles northwest of Southampton. Most conspicuous among the public buildings is the splendid cathedral, dating from 1220, one of the grandest and most interesting examples of Gothic architecture in England. The building is 473 feet in length, and the width of the nave is 82 feet. It is in the form of a double cross, with a graceful and exquisite interior, and has a spire, 404 feet in height, which is the highest in England. Notable for its perfect proportions and the uniformity of its style, the cathedral's features include cloisters, chapter house, lady chapel, and library. Two miles north of Salisbury are scanty remains of Old Sarum, known to the Romans as *Sorbiodunum,* which became the home of kings of Wessex; about 1075 a bishopric was established there, and in the 13th century the see was transferred to New Sarum. Pop. (1945) 30,550.

SALISHAN, sā'lĭsh-ăn, **INDIANS,** a linguistic stock of North American Indians comprising a large number of tribes or bands, most of them insignificant in numbers, the original habitat of which included the southern half of British Columbia, most of Washington, and parts of Oregon, Idaho, and Montana. The tribes were visited by Juan de Fuca (1592), by the Spanish navigators who later explored the coast, by George Vancouver (1792–1794), and by Lewis and Clark (1804–1806), who, in their narrative of the expedition (1814), gave the first

definite information regarding them. The fur-traders penetrated their country early in the 19th century and while Astoria, at the mouth of the Columbia, was not founded within their immediate territory, its establishment formed the beginning of the change in the primitive condition of the Salishan and the surrounding tribes which perhaps reached its climax soon after the establishment of the trading post at Victoria, British Columbia., in 1843. In their habits and customs the Salishan Indians may be divided into the coast and the interior groups. Among the former, at least, the gentile system is recognized, descent being in the male line; their houses are long communal structures, built of puncheons and designed to accommodate several families, each with its own fire. Sea products formed their chief sustenance; the canoe played an important part in their daily life; slavery was practised, and the *potlatch,* a curious institution which consisted of elaborate feasting and the distribution of personal property, held sway to such an extent as frequently to impoverish the most progressive members of the tribe. The interior Salishan tribes hunted and fished for salmon in the many streams that drain their former territory. Their houses, unlike those of the coast, were conical and constructed of poles covered with grass, pine-needles, bark and earth. The custom of head-flattening was practised particularly among the coast Salish, but, strange as it may seem, this habit did not prevail among those members of the stock now designated by the name «Flatheads.» There are many tribes or sub-tribes of the Salishan stock in Washington, Montana and British Columbia, numbering in all about 18,500 individuals, of whom about 8,000 are within the limits of the United States. The principal Salishan tribes within Canadian territory are the Lillovet, Okinagan, Thompson Indians and Lhuswap. Of the population of the Canadian divisions of the stock little reliable information is obtainable, as many tribes or tribal divisions are assembled on each of several reservations, only the combined population of which is known. These are distributed as follows: Fraser River Agency, about 5,000; Kamloop's Agency, about 2,600; Cowichan Agency, about 1,850; Okinagan Agency, 950; Williams Lake Agency, 1,900; Kootenay Agency, 50. The principal Salishan tribes or bands on reservations in the United States are:

Colville Agency, Washington.— Cœur d'Alêne (Skitsuish), 474; Colville, 296; Kalispel or Pend d'Oreilles, 150; Lake or Senijextee, 307; Spokane, 653; Okinagan, 575; Sanpoil and Nespelim, 400, making a total of 12,350.

Puyallup Agency, Washington.— Chehalis, 156; Georgetown, Humptulip, Quaitso and Quinaiel, 324; Nisqualli, 107; Puyallup, 536; Skallam or Clallam, 317; Skokomish, 165; Squaxon, 118.

Tulalip Agency, Washington.— Lummi, 340; Muckleshoot (collective), 148; Port Madison, 150; Swinomish, 313; Tulalip, 488.

At Large in Washington.— Nooksak, 200; Piskwans or Wenatchi, 166.

Flathead Agency, Montana.— Charlot's band of Flatheads, 157; Confederated Flatheads, Pend d'Oreilles and Kootenai, 1,310; Lower Kalispel or Pend d'Oreilles, 53; Spokan, 77.

Since the above statistics were published many of the younger Indians have left the reservations and gone into civilized life, which has reduced those remaining on the various agencies to over 10,000 in Canada and over 8,000 in the United States. Consult Curtis, E. S., *Indian Days of the Long Ago* (Yonkers 1914); Farrand, L., *Basket Designs of the Salish Indians* (New York 1900); Trey, A., *Von Salis-Seervis* (Frauenfeld 1889); Hill-Tout, C., *British North America* (London 1907); Hodge, *Handbook of American Indians* (Washington 1910); Pöder, G. W., *Der Dichter Johann Gaudenz von Salis-Seervis* (Saint Gall 1863); Smet, P. J. de, *Letters and Sketches* (Philadelphia 1843).

SALIVA. See Salivary Glands.

SALIVARY GLANDS, the glands which secrete saliva, the fluid of the mouth, or spittle. By means of these secretions the food in the mouth is brought to a pulpy state, and through the chemical action of saliva certain changes are effected in the constituents of the food. In man the salivary glands comprise three pairs, as in the mammalian class generally. Of these the largest is the parotid gland, lying in front of the ear, before the mastoid process of the temporal bone, and behind the ramus of the lower jaw. Its duct is the parotid duct, or duct of Steno. It opens into the mouth opposite the second upper premolar tooth. This gland measures from two and one-half to three inches in length, and is supplied with blood by branches from the main trunk of the external carotid artery, from the temporal, facial and other blood-vessels. The nerve supply is chiefly derived from the vegetative nervous system. The submaxillary gland, next in size, is in the lower portion of the lower jaw, above the digastric muscle. Its duct (Wharton's duct) is about two inches long, and its arteries and veins are derived from the facial and lingual vessels. The third distinct salivary gland, the sublingual, is still smaller, and is situated on the floor of the mouth, beneath the front part of the tongue. It is from one and one-half to two inches through its long axis. Its numerous ducts open on the floor of the mouth by many minute apertures. The excretory ducts of subsidiary glands in the mouth open simply on the mucous membrane of the mouth. The minute or microscopic structures of the salivary glands are composed of lobes in turn composed of lobules, each of which contains a small branch of the main duct of the gland, the subdivisions of which ultimately terminate in minute vesicles or sacs, known as acini. The salivary fluid as found in the mouth is usually mixed with the mucus secreted by the mucous or lining membrane of the mouth, and is thus rendered of viscid consistence.

Salivary glands are absent in some mammals, as whales; in some reptiles, as crocodiles; and in most fishes. In mammals alone salivary glands are present of the definite structure seen in man; but in many reptiles, as in serpents, definite (buccal) glands exist, within the inside margin of the jaws. In birds the submaxillary glands may be of large size; and in some forms, as woodpeckers, the saliva may be normally of a viscid consistence, adapted for smearing the tongue, and for thus aiding in the capture of insect-prey. Swifts, as is well

known, secrete in their salivary glands a glutinous substance of which in great part, often almost wholly, they build their nests. (See Birds' Nests, Edible).

When first secreted, saliva gives an alkaline reaction. During digestion this alkaline condition persists. During fasting saliva gives a neutral reaction, as also when slowly secreted, its alkalinity then being neutralized by the acid of the mucus of the mouth. Microscopically examined, saliva shows minute solid particles, probably derived from the secreting structures; and when mixed with the fluids of the mouth it contains also epithelial scales from the mouth and tongue, and mucus corpuscles, mostly from the tonsils. Freed from these, the saliva is a fluid either colorless or bluish-gray.

During mastication the flow of saliva is greatly accelerated, the presence of food in the mouth acting as the stimulus to its secretion; and different foods affect the secretion in different degrees; while mental impressions, without the presence of food, will cause saliva to flow, or will "make the mouth water." Under the action of different branches of the vegetative nervous system the secretion may be thin and watery, or thick. It is constantly subject to mental impressions, such as fear and hate and haste and fatigue. The functions or uses of saliva are both mechanical and chemical. It acts mechanically to incorporate and mix the food in the mouth, to render swallowing easier and to keep the tongue and mouth moist, so aiding articulation. (See Digestion).

The secretion of the pancreas markedly resembles that of the salivary glands in chemical composition, and exerts an action on the food similar in many respects, and in those forms in which salivary glands may be wanting or undeveloped the pancreatic secretion may supply the place of the salivary fluid. This action is chiefly confined to a slight action upon starches, partly converting them to sugars. Hence the slight sweetness of bread when chewed. Among invertebrates salivary glands are usually well represented. Insects and other *Annulosa* and the generality of mollusks thus possess definite structures devoted to the secretion of the salivary fluid.

Calculous concretions (salivary calculi) may form in the salivary glands, and may cause obstruction of their ducts, and necessitate the performance of an operation for their removal. Saliva would appear to become abnormal and to constitute a source of infection in hydrophobia or rabies; and syphilis is said to have been transmitted through this medium. Occasionally the elements of urine have been present in saliva — forming the so-called urinary saliva of pathologists — in consequence of diseased conditions, on the removal of which the secretion became restored to its normal composition. Milky saliva, so named from the presence of milk constituents, has also been described as a condition occurring in some parturient women. See Higier, 'Vegetative Neurology' (1919).

SALIVATION, or **PTYALISM**, a superabundant secretion of saliva, sometimes occurring in disease, but usually, in medicine, either determined locally by the use of masticating irritants or by drugs which act upon the whole system, especially by mercurial preparations. In the last case it is accompanied by a coppery taste and by the swelling of the gums, which become of a pale rose color, except close to the teeth, where they are of a deeper red. The breath is "mercurial" and very fetid, and the teeth seem elongated and loosened. If the use of mercury is continued the swelling of the gums increases; it affects the tongue and all the salivary organs; finally, the mucous membrane is studded with small superficial ulcers covered with a white skin. Salivation is ordinarily anticipated, during mercurial treatment, by maintaining cutaneous perspiration by means of warm baths, friction and exercise. If salivation is persistent notwithstanding the use of these means, emollient gargles containing more or less of opium are used, and on the abatement of the salivation they are replaced by astringent tonics. Salivation was formerly frequent, but has become rare through modifications in mercurial treatment.

SALIX, one of the two genera of the family *Salicaceæ* (the other being *Populus*). The species are diœcious trees and shrubs, inhabiting principally the northern hemisphere and the temperate and arctic zones, and very abundant therein, especially along the banks of streams and ponds. The leaves are alternate and narrow and the small flowers, reduced to a disc bearing either stamens or pistil, according to sex, are gathered into unisexual catkins, each flower subtended by a bract. These catkins usually appear before the leaves, and are fertilized by insects, having nectaries for their attraction, the male flowers, moreover, showing large bright-colored anthers and a honey-like odor. The two-valved capsules contain numerous seeds, crowned by dense plumes of soft hairs, which enable them to float off on the wind and be disseminated by it. There are described nearly 300 species of *Salix*, which have been broadly classified as Sallows, Osiers and Willows.

Many fossil forms of *Salix* have been found. Salicin is a crystalline glucoside obtained from the bark of various species of *Salix*, and is one of the sources of salicylic acid, for which it is sometimes substituted in medical practice. See also Willow.

SALLEE, SALE, SALI, SLA, or SULLEE, Morocco, a seaport on the western coast of the Atlantic, 106 miles west of Fez, at the mouth of the Buregreb, formerly the great centre of Moorish piracy, immense depredations being committed from it upon European commerce. It is particularly noted for the carpets which it produces, of fine texture and bright colors. The river, which formerly admitted large vessels, is now choked up with sand. On the opposite side of the river stands Rabat (q.v.), called often New Sallee. Pop. of Sallee about 20,965.

SALLUST, săl'ŭst (Gaius Sallustius Crispus), Roman historian: b. Amiternum, in the Sabine district, 1 Oct. 86 B.C. (668 A.U.C.); d. Rome, 13 May 35 B.C. (719 A.U.C.) or 34 B.C. (720 A.U.C). He held the offices of quæstor and *tribunus plebis*, attained senatorial rank, was of the Cæsarian faction in the Civil War, went to the war in Africa as prætor in 47 B.C. and after the close of the struggle at Thapsus was made commander in Africa with title of proconsul. Having returned to Rome in 45 B.C., he formed the extensive gardens celebrated as

the Horti Sallustiani and spent the remainder of his life in retirement.

Of Sallust's historical works, two monographs have come down to us intact: *Bellum Catilinae,* which was probably published in 43 B.C.; and *Bellum Jugurthinum,* which appeared about 41 B.C. The first, an account of the conspiracy of Catiline, was not prepared from the original documents available, and its chronology and facts are distorted. It aims at the explanation of motive and general development, and is of value for its literary rather than its historical qualities. Sallust concurs in Cicero's estimate of Catiline. The second work, an account of the Jugurthine War of 111–105 B.C., shows evidence of the use of original sources as well as of the author's own experience in Africa, but it, too, is of more interest for its portraiture than its history. Sallust's partisanship of Marius is also apparent. His greatest work, the five books of the *Historiae,* a history of the republic from 78 to 67 B.C., has survived only in fragments, including four speeches and two letters. Sallust was influenced by the Greek historian Thucydides. His style, consciously archaic, is graphic and effective. The best Latin text with an English translation is John C. Rolfe's *Sallust* (New York 1931).

SALMASIUS, săl-mā′zhĭ-ŭs, **Claudius** (Lat. name of CLAUDE DE SAUMAISE), French classical scholar: b. Semur-en-Auxois, France, April 15, 1588; d. Spa, Spanish Netherlands, Sept. 3, 1653. The son of a magistrate, he studied under Isaac Casaubon in Paris and under the elder Denis Godefroy (Gothofredus) in Heidelberg, and was admitted to the bar in Dijon in 1610. He soon abandoned the practice of law to devote himself to scholarship, however, and in 1629 was prevented from succeeding to his father's post because of his Protestantism. In 1631 he accepted a professorship at the University of Leiden, and there, except for a visit to Sweden in 1650–1651 at the invitation of Queen Christina, he remained for the rest of his life. Salmasius was one of the most learned men of his times. Besides Latin and Greek, he was acquainted with Hebrew, Arabic, Persian, Coptic, and other ancient languages, and he published more than 80 works. Among the most important are an edition of Lucius Annaeus Florus (1609); Casaubon's and his own notes on the *Historia Augusta* (1620); *Plinianae exercitationes in C. Julii Solini polyhistora* (1629), a commentary on Gaius Julius Solinus' *Polyhistor; De lingua Hellenistica* (1643); *Observationes in jus Atticum et Romanum* (1645); and the posthumous *De re militari Romanorum* (1657). It is, however, for his controversy with John Milton (q.v.) that Salmasius is best known. A firm believer in the divine right of kings, he published in 1650 his *Defensio regia pro Carolo I,* in defense of Charles I of Great Britain, to which Milton replied in the celebrated *Pro populo Anglicano defensio contra Claudii anonymi, alias Salmasii defensionem regiam* (1651).

SALMERON Y ALONSO, săl-mā-rōn′ ē ä-lôn′sō, **Nicolás,** Spanish statesman and philosopher: b. Alhama de Almería, Spain, April 10, 1838; d. Pau, France, Sept. 21, 1908. He was educated at the universities of Granada and Madrid, and in 1866 succeeded to the chair of philosophy at the latter. An ardent republican, he was imprisoned for five months in 1867, and in the following year was a member of the revolutionary junta. Elected to the Cortes in 1871, he became minister of justice in 1873, and from July to September of that year served as president of the republic. Forced into exile in 1875, he was not permitted to return to Spain until 1881. Three years later he resumed his professorship, and in 1886 was re-elected to the Cortes. An excellent orator and an influential teacher, Salmerón did much to form the succeeding generation of Spanish scholars.

SALMON, săm′ŭn, **Daniel Elmer,** American veterinarian: b. Mount Olive, Morris County, N. J., July 23, 1850; d. Butte, Mont., Aug. 30, 1914. Following his graduation from Cornell University in 1872, he practiced veterinary medicine in Newark, N. J. In 1879 he became an investigator for the United States Department of Agriculture. He organized the department's veterinary division in 1883, and in the following year, when it became the Bureau of Animal Husbandry, was appointed its chief, a post he held until 1905. In this capacity he did much to ensure pure meat supplies. Among the practices he introduced were a nationwide system of meat inspection, the inspection of cattle exports, and the quarantine of imported livestock. From 1906 to 1912 he headed the new faculty of veterinary science at the University of the Republic in Montevideo, Uruguay, and in the following year became manager of a laboratory in Butte, Mont., producing serum against hog cholera. Salmon served as president of the American Public Health Association and the American Veterinary Medical Association. He did notable research in livestock diseases and published his findings in almost 100 articles.

SALMON, săl′mŭn, **Thomas William** American psychiatrist: b. Lansingburg, Rensselaer County, N. Y., Jan. 6, 1876; d. Long Island Sound, N. Y., Aug. 13, 1927. He received his M.D. degree from Albany Medical College in 1899, and four years later joined the staff of the United States Marine Hospital Service (later the United States Public Health Service). In 1905 he was assigned to Ellis Island, where he became concerned with the problem of mentally ill immigrants. While on leave from the service in 1911 as chief medical examiner for the New York State Commission in Lunacy, he devised regulations to deal with the problem in an enlightened fashion. In 1915 be became medical director of the National Committee for Mental Hygiene, which sent him to England to study the effects of combat on mental health. After the United States declared war, in 1917, he was commissioned a major in the United States Army Medical Corps. He remained in the army for two years, rising to the rank of brigadier general. For his services in preventing the induction of the mentally unfit and in controlling shell shock he received the Distinguished Service Medal. (See also PSYCHIATRY—*Psychiatry of World War I.*) In 1921 he was appointed professor of psychiatry at Columbia University. His career was cut short six years later when he was drowned while on a yachting trip. Salmon was a founder of *Mental Hygiene* and the author of numerous articles in this and other periodicals.

SALMON, săm′ŭn, city, Idaho, seat of Lemhi County, situated at the confluence of the Salmon

and Lemhi rivers, at an altitude of 4,003 feet, 160 miles northeast of Boise. It is the trading center for a mining, lumbering, and agricultural area and has creameries and sawmills. A federal fish hatchery and the headquarters of the Salmon National Forest are located here. Salmon was permanently settled in 1866 and founded as Salmon City in the following year. It assumed its present name in 1869. Government is by mayor and council. Pop. (1950) 2,648.

SALMON, river, Idaho, rising in the Salmon River Mountains in Custer County. It flows north-northeast to the city of Salmon, where it is joined by the Lemhi River, and then north, west across the state, and north again to its confluence with the Snake River in Nez Perce County, 38 miles south-southeast of Lewiston. Its total length is about 425 miles. The river abounds in salmon and has cut a number of spectacular canyons through the mountains.

SALMON, a fish of the family Salmonidae, regarded as the highest type of the true or teleostean fishes. The family includes the North American genera *Coregonus* (whitefishes), *Leucichthys* (ciscoes), *Stenodus* (the inconnu or sheefish), *Cristivomer* (the lake trout), *Salvelinus* (trouts or chars), *Oncorhynchus* (Pacific salmon), and *Salmo* (Atlantic salmon). In *The Fishes of North and Middle America* (part 1, p. 460, Washington 1896), the eminent American ichthyologist David Starr Jordan (q.v.) spoke of this group as follows:

> As now restricted, this is no longer one of the large families of fishes, but in beauty, activity, gaminess, and quality as food, and even in size of individuals, different members of the group stand easily with the first among fishes. The *Salmonidae* are confined to the northern regions, and north of about 40° N., everywhere abundant where suitable waters occur. Some of the species, especially the larger ones, are marine and anadromous, living and growing in the sea, and entering fresh waters to spawn. Still others live in running brooks, entering lakes or the sea as occasion serves, but not habitually doing so. Others again are lake fishes, approaching the shore, or entering brooks in the spawning season, at other times retiring to waters of considerable depth. Some of them are active, voracious and gamy, while others are comparatively defenseless and will not take the hook. The large size of the eggs and their lack of adhesiveness, with the ease by which the eggs may be impregnated, render the Salmon and Trout especially adapted for artificial culture. The *Salmonidae* are of comparatively recent evolution, none of them occurring as fossils, unless it be in recent deposits. The instability of the specific forms and the lack of sharply defined specific characters may be in part attributed to their recent origin, as Dr. [Albert C. L. G.] Günther has suggested.

ATLANTIC SALMON

The Atlantic salmon (*Salmo salar*) is native to the rivers of both sides of the North Atlantic Ocean. Its body is moderately elongate and only slightly compressed, the greatest depth being about one fourth the total length without the caudal fin. The length of the head is approximately equal to the depth of the body, and the mouth is of moderate size. The scales, which are comparatively large, number about 120 in the lateral line. The dorsal fin has 11 rays, and the anal fin 9 rays. The color, like the form, varies with sex, age, food, and condition. The adult is brownish above and silvery on the sides, with numerous small black spots, often X- or XX-shaped, on the head, body, and fins, and with red patches along the sides of the male. Young salmon have about 11 dusky crossbars, besides black and red spots. The average adult weighs 10 to 20 pounds, but specimens of over 80 pounds have been recorded.

North American Range.—The original natural range of the Atlantic salmon in North America stretched from Greenland to Long Island Sound. In fact, the vast abundance of salmon was one of New England's chief recommendations for settlement in colonial times. The Merrimack River is reported to have been so filled with them during the spring migration that they sometimes crowded the fish near the banks out onto land. Even in the late 18th century the Rev. Samuel Andrew Peters was able to report in his *General History of Connecticut* (London 1781) that the "shad, bass, and salmon more than half support the province." There is no good reason to suppose that salmon did not originally run in the Hudson River, although direct evidence that they did so in abundance is lacking. In his *Zoology of New-York* (part 4, p. 242, Albany, 1842), the naturalist James E. De Kay mentions that one was taken near Troy, N. Y., in August 1840. Long before then, however, the New York market had ceased to be supplied from

Dr. George B. Kelez, Fish and Wildlife Service

Salmon jumping Brooks Falls, Alaska.

the Connecticut River, receiving instead salmon from the Kennebec River, packed in ice. Few, if any, salmon entering the St. Lawrence River from the sea ever ascended as far as Lake Ontario, and the salmon inhabiting that lake and its tributaries as a rule made the lake their sea and the limit of their downward migrations.

The reason for the decline in numbers of the Atlantic salmon was everywhere the same—overfishing in the rivers and the damming of the upper streams for milling and other purposes. Although Peters had recorded in 1781 that salmon "fill the Connecticut River for many days, and no finite being can number them," by 1819 they had almost disappeared from the river. In 1952, *The Book of Fishes* (see *Bibliography*) reported that the annual catch for Maine, which in 1889 had been 152,740 pounds, was last recorded as 1,000 pounds.

Habits and Feeding.—The American ichthyologist George Brown Goode wrote at great length on the habits and feeding of salmon. In *The Fisheries and Fishery Industries of the United States* (see *Bibliography*), he remarked that most salmon are peculiarly freshwater fishes,

though several share the sea-dwelling habit, and others, like the brook trout, descend into salt water when they are not prevented from doing so by barriers of temperature. On page 470 he stated:

> I am inclined to the view that the natural habitat of the Salmon is in the fresh waters, the more so since there are so many instances . . . where it has been confined for years in lakes without apparent detriment. . . . The Salmon while it remains in the sea or in the brackish estuaries takes particular delight in feeding on crustaceans and their eggs, small shrimps, and young crabs. When in the rivers they eat but little, though they are at times eager enough for food, as testify their voracious rushes at the angler's fly-hook. The absenteeism of the Salmon is due principally to the dearth of desirable food in the rivers. The young fish stay in fresh water for one, and frequently two, years. When they pass down to the sea they weigh but a few ounces. They find congenial food and begin to grow rapidly. The broad world of ocean affords them new opportunities for adventure and self-advancement, and it is only when summoned by the duties of family life that they return within the narrow limits of the old home. When Salmon live in the lakes they prey upon minnows and other small fishes, but those of the sea delight also in small crustaceans and their eggs, to which they owe the vivid color of their flesh. The habits of successive generations become hereditary traits. . . .

It is as an adult, four years of age or a little older, that the salmon enter the rivers and work their way upstream. They have been two years or more in the sea, where and how living are little known. Young salmon that have stayed only two years in the sea remain small: size increases with the length of time passed in the sea. Probably salmon do not go very far from the mouth of the river in which they were born. They enter rivers as soon in the spring as the water has reached a moderate degree of warmth, and they therefore appear in southern rivers much earlier than in northern ones. They are in magnificent condition and make their way upstream with extraordinary persistence and force, overcoming swift rapids, climbing cataracts, and leaping unbroken falls as high as 12 feet (only the strongest can accomplish so great a feat, and sometimes only after repeated efforts). It is during this early advance that the angler seeks the streams where the salmon are running (see ANGLING).

Having reached, as near as time and circumstances permit, the sources of the stream, the females deposit their eggs in vast quantities. The males simultaneously void their milt, so that impregnation takes place at once. The Atlantic salmon does not die after spawning, and may return to the sea.

Growth and Development.—Spawning takes place in North American rivers late in the fall. The development of the embryo is soon checked by the winter cold, so that it does not burst the shell of the egg until early spring. At this time, the embryo salmon has a slender, half-transparent trunk, less than 1 inch in length, carrying an immense ovoid sac—the yolk sac—suspended beneath. For about six weeks after hatching it hides in crevices among stones, incessantly fanning its pectoral fins. During this period it takes no food, but is supported and nourished by the yolk sac, whose substance is gradually absorbed into the rest of the body. Not until the sac has nearly disappeared does the salmon really look like a fish and begin to seize and swallow food. It now puts on a mottled coat with several heavy, dark bars across its sides and with bright red spots, larger and fewer than those of a trout. It therefore looks very unlike the adult salmon but much like a young trout. In this stage it is termed, in Scotland and England, a parr, and was formerly thought to be a wholly different species from the salmon.

The parr stage lasts a year or two in British rivers, and the few observations that have been made in the United States and Canada indicate that its duration is more likely to be two years than one in North American rivers. The parr, which at first is little over an inch long, is provided with good teeth and a good appetite. Beginning to feed at a season of the year when the water is almost crowded with small insects and other more minute creatures, it grows rapidly, probably increasing its weight 30 or 40 times during its first summer. In two years it reaches a length of 6 or 8 inches, and its bright red spots and dark bars have been replaced by a silvery coat like that of the adult salmon. It is now termed a smolt and is ready to go to sea, which it does with little delay, passing beyond the range of man's observation to a region where it finds a rich feeding ground and rapidly increases in size.

In northern American rivers, those of New Brunswick and farther north, as in those of northern Europe, the salmon returns from the sea when it has attained a weight of 2 to 6 pounds, and is then termed a grilse. In Canadian rivers in general, grilse occur in great numbers, coming in from the sea at a later date than the adults, but like them ascending to the upper waters and mingling freely with them. Grilse are seldom seen in the rivers of the United States, yet it by no means follows that the salmon in these streams do not pass through the same phases of growth as those of Canada and northern Europe, or that the growth is more rapid. It is merely that in the grilse stage the salmon of the United States generally lack the instinct, or perhaps have not undergone some glandular change, that impels their more northern relatives to seek fresh water.

Grilse exhibit to a great degree the characteristics of the adult salmon. The main external differences are a shorter head, a slenderer form, and a difference in color and markings. They are remarkably active and agile, leaping to great heights. The male is sexually well developed and mates with the adult salmon, but the female is immature. Like the adult, grilse abstain from food, and consequently lose weight, during their stay in fresh water.

PACIFIC SALMON

There are five species of salmon on the Pacific coast of North America, all belonging to the genus *Oncorhynchus:* the quinnat, Chinook, or king salmon (*O. tschawytscha*); the red, sockeye, or blueback (*O. nerka*); the humpback or pink (*O. gorbuscha*); the silver or coho (*O. kisutch*); and the dog or chum (*O. keta*). The features which distinguish the Pacific from the Atlantic salmon are not marked, and consist chiefly in a larger number of rays in the anal fin and of branchiostegals, gill rakers, and pyloric caeca.

These five salmons form the most important group of fishes entering the rivers of North America. In value of total catch, the red is the most important, followed by the humpback, Chinook, dog, and silver. The aggregate catch in pounds of Pacific salmon in the Pacific coast states and Alaska was as follows in the period 1949–1953:

Year	Pacific coast states	Alaska
1949	95,859,000	388,345,000
1950	63,725,000	264,919,000
1951	97,635,000	276,588,000
1952	69,307,000	282,967,000
1953	92,658,000	220,276,000

The steelhead (*Salmo gairdneri*), technically a trout but popularly regarded as a salmon, also inhabits the waters of the Pacific coast and adds to the importance of the salmon tribe.

Quinnat, Chinook, or King Salmon.—The characteristics of the quinnat salmon are as follows: scales in longitudinal series, from 135 to 155, with an average of about 145; pyloric caeca, 140 to 185; gill rakers, comparatively short and usually 23 in number, 9 being above the angle; rays in anal fin, 16; branchiostegals, 15 to 19. The body is robust; the head, conic; the eye, small; the caudal fin, deeply forked. The color above is dusky, sometimes with a bluish or greenish tinge; the sides and belly are silvery; and the head is dark with a metallic luster. The back and the dorsal and caudal fins have numerous round black spots.

The quinnat is known in various parts of its range as the Chinook, king, Columbia River, Sacramento, or tyee salmon. It is the finest of the Pacific salmons. Not only is it superior in food qualities, but it attains a much larger size and has a wider geographical range and a greater value per pound. When fresh from the ocean, it is a very handsome, well-formed fish, greatly resembling the Atlantic salmon, though less symmetrical and graceful. It is of a uniform rich red color, which becomes paler or streaked at the approach of the spawning season. Its value for canning purposes is enhanced by the persistence of the red color of the meat after cooking. No other salmon in the world compares with it in size. In the Yukon River in Alaska it reaches a weight of over 100 pounds. Farther south it runs smaller, although in the Sacramento River specimens weighing 50 or 60 pounds are not rare; 22 pounds is a fair average weight in the Columbia River, and 16 pounds in the Sacramento. Its known range is practically from Monterey Bay in central California to the Yukon, but it probably ranges farther north.

While in the sea, quinnat salmon probably do not wander very far from the mouths of the rivers they have left, and for this reason usually return to spawn in the rivers in which they were hatched. They prefer the larger rivers, like the Sacramento, the Columbia, the Nushagak, and the Yukon. They are very persistent in ascending the rivers to spawn, and have been seen crowding up the rivulets which form the headwaters of the Sacramento until nearly half of their bodies were exposed to the air. No matter how far the headwaters of a river are from the ocean, some of the salmon will press forward until they are stopped by impassable obstructions or by water too shallow for them to swim in. On reaching the headwaters, they remain for a week or two before proceeding to the spawning grounds. Their rate of progress varies with the season and probably depends to a great extent on the rainfall and the state of the river; rain, roily water, or high water always hastens their progress.

When the quinnat first come from the ocean, the sexes are almost identical in appearance, but as the time for spawning approaches, a difference is noticed between them, and during the spawning season it becomes more marked. The fully developed ova of the female give her a round, plump appearance, while the male grows very thin. His head flattens, the upper jaw curves like a hook over the lower, and the eyes become sunken. Large, powerful, white, doglike teeth appear on both jaws, and the fish acquires a gaunt and savage appearance. As soon as quinnat reach fresh water, their appetites grow less, and their throats begin to narrow, and their stomachs to shrink. This process does not at first entirely prevent them from feeding, but it changes them enough to enable them to overcome the temptation to return to their well-stocked feeding grounds in the ocean. Moreover, the longer they remain in fresh water, the greater the changes, and the desire to turn back for food is correspondingly lessened. This alteration comes about gradually, increasing day by day from the time they leave tidewater until at the near approach of the spawning season their throats and stomachs become entirely incapable of receiving food, and the desire to feed leaves them entirely. The great reserve of flesh and blood which they bring with them from the ocean enables them to keep the vital organs active until their mission up the freshwater streams is accomplished.

The spawning season of the quinnat varies in different rivers and, considering the entire Pacific coast, lasts at least six months. In July the summer run spawns at the headwaters of the McCloud and Sacramento rivers in California; in August and September, farther down these rivers. In October the fall run begins in the McCloud and below, and this run continues spawning through November into December. In the Columbia River spawning begins at the headwaters in June; at Clackamas, Ore., 125 miles from the mouth of the Columbia, it begins about the middle of September and continues until November.

A few days before they are ready to spawn, the salmon hollow out elongated cavities with their heads and tails in the gravel beds of the river where there is some current, and here in due time the eggs and milt are deposited. The eggs drift into the crevices in the pile of stones thrown up below the hollow, sink to the bottom, and remain in that protected position during incubation; here, also, the young remain until the umbilical sac is absorbed. The eggs and young are liable to destruction by freshets, but are comparatively safe from other injurious influences. The quinnat is not so prolific as the Atlantic salmon, 300 or 400 eggs to each pound of the weight of the parent fish being a fair average.

Quinnat salmon, like all the Pacific salmon, do not return to the sea, but die on or near their spawning grounds. After spawning they rapidly deteriorate, the flesh shades off to a light, dirty pink, and they become diseased and emaciated. Their scales are wholly absorbed in the skin, which is of a dark olive or black color, and blotches of fungus appear on their heads and bodies. In places there are long white patches where the skin has partially worn off. Their fins and tails become badly mutilated, and in a short time they die exhausted.

As the salmon ascend the rivers, they are caught by gill nets, fyke nets, pounds, weirs, seines, wheels, and other devices. In the Sacramento and Columbia the greater number are caught as they head upstream by means of gill nets drifting with the current or tide. In the rivers they are comparatively safe from natural enemies except otters, ospreys, and fishers, but immense numbers are destroyed at the mouths of the streams by seals and sea lions.

The quinnat has been introduced into Japan, Australia, New Zealand, and Europe, but efforts to acclimatize it on the Atlantic coast of the United States have been unsuccessful.

Red, Sockeye, or Blueback Salmon.—The characteristics of the red salmon are as follows: scales in longitudinal series, about 130; pyloric caeca, 75 to 95; gill rakers, comparatively long and 32 to 40 in number; rays in anal fin, 14 to 16; branchiostegals, 13 to 15. The body is rather slender; the caudal fin, much forked; the anal and the dorsal fins, low. The color above is bright blue, and the sides are silvery. There are no spots.

If we consider the entire west coast, the red salmon is probably more numerous than all the others combined. It is known in different regions as the blueback, redfish, Fraser River salmon, and sockeye or sauqui. Since 1914, when the route to its spawning grounds was temporarily blocked, it has not returned in abundance to the Fraser River.

HUMPBACK SALMON

ATLANTIC SALMON

RED SALMON

SILVER SALMON

For canning purposes the red salmon is only slightly inferior to the quinnat, for the color of its flesh is a rich red that persists after canning. Large quantities are canned in Alaska, particularly on Kodiak Island, and its commercial importance to the territory is indicated by the fact that about half the value of Alaskan canned salmon consists of fish of this species. Comparatively few red salmon are sold fresh in the United States.

This is next to the smallest of the salmons. The maximum weight is about 15 pounds, but the fish rarely weighs over 8 pounds, and the average weight is scarcely 5 pounds. In various lakes, where it weighs only half a pound when mature, it is called the little redfish. The red salmon ranges from Humboldt Bay, Calif., to the far north, but in general it ascends only those rivers which rise in cold, snow-fed lakes. Except in the breeding season, its color is a clear, bright blue above, with silvery sides and belly. At the spawning period the back and sides become red, and the male develops an extravagantly hooked upper jaw. This fish is also found landlocked. In lakes it is generally called silver trout; in streams, redfish.

Humpback or Pink Salmon.—The characteristics of the humpback salmon are as follows: scales, very small, 210 to 240 in longitudinal series; pyloric caeca, very slender, about 180 in number; gill rakers, short, about 28 in number, 13 being above the angle; anal rays, 15; branchiostegals, 11 or 12. The color is bluish above and silvery on the sides. The hind part of the back, the adipose fin, and the tail have numerous black spots; the largest spots, of oblong shape, are on the tail.

The humpback is the smallest Pacific salmon. Its weight averages only 5 pounds, and rarely reaches 10 pounds. Its range is from Alaska, where it is abundant, to California, and it also runs off Japan. In food qualities the fresh-run humpback is scarcely inferior to any other salmon. While the flesh has a very fine flavor, it is paler than that of other red salmon, and the species was formerly neglected by canners. By the 1950's, however, it was first in quantity and second only to the red salmon in total value among the varieties of canned salmon of the Pacific states and Alaska.

The humpback salmon generally seeks the smaller streams for the purpose of spawning and deposits its eggs a short distance from the sea, sometimes within only a few rods of the ocean. At Kodiak Island, Alaska, where it is often very abundant, it arrives in the latter part of July, the run continuing for only a few weeks. Spawning takes place in August.

Silver or Coho Salmon.—The characteristics of the silver salmon are as follows: scales, large, from 125 to 135 in longitudinal series; pyloric caeca, comparatively few and large, 45 to 80 in number; gill rakers, long and slender, 23 in number, 13 being below the angle; anal rays, 13 or 14; branchiostegals, 13 or 14. The body is long; the head, short and conic; the snout, blunt; the eye, small; the fins, small, the caudal fin being deeply forked. The color above is bluish green, and the sides are silvery and finely punctulated. Spots are few and obscure on the head, back dorsal fin, adipose dorsal fin, and the upper rays of the caudal fin.

The silver salmon is also known as the silversides, skowitz, kisutch, hoopid salmon, and coho salmon. It is a beautiful fish, with a graceful form and a bright silvery skin. Its flesh, which is fairly good, usually has a bright red color, but this fades on cooking. Canned in large quantities, it is also well adapted for quick freezing for the market. Its average weight in the Columbia River and Puget Sound is 8 pounds, but in Alaska it is nearly 15 pounds. Its range is from San Francisco to northern Alaska, and as far south on the Asiatic coast as Japan. It runs up the rivers to spawn in the autumn or early winter, when the waters are high, but usually does not ascend great distances from the ocean.

Dog or Chum Salmon.—The characteristics of the dog salmon are as follows: scales, of medium size, 138 to 155 in lateral line; pyloric caeca, 140 to 185; gill rakers, short and few, 9 being above and 15 below the angle; anal rays, 13 or 14; bran-

chiostegals, 13 or 14. It has the form of the quinnat, but its head is longer and more depressed. The color is dusky above and on the head, and paler on the sides. There are sometimes very fine spots on the back and sides. The tail is either a plain dusky color or finely spotted, with a black edge, and the other fins are blackish.

The dog salmon is dried in large quantities by the Alaskan natives. Its average weight is 12 pounds, and the maximum about 20 pounds. It is found from San Francisco to Kamchatka, being especially abundant in Alaska, and also occurs off Japan. The enlargement and distortion of the jaws give the species a very repulsive look, and its large teeth give it its common name. When it has just arrived from the ocean, its flesh has a beautiful red color and is not unpalatable, but it deteriorates rapidly in fresh water. The dog salmon spawns in shallow rivers and creeks. Larger quantities are utilized in Puget Sound than elsewhere in the Pacific states.

Steelhead.—In form, size, and general appearance, the steelhead resembles the salmon of the Atlantic coast, and is distinguished from other Pacific coast salmon by its square tail, small head, round snout, comparatively slender form, light-colored flesh, and habit of spawning in the spring. It is slenderer than the quinnat and consequently not so heavy for its length. Its average weight in the Columbia is about 8 pounds, although it sometimes reaches 30 pounds.

This fish, popularly regarded as a salmon, is now generally accepted as the silvery, sea-run form of the rainbow trout (*Salmo gairdneri*). It is found from San Diego north to Alaska and, in its rainbow phase, in eastern and central North America. Its color varies considerably with the locality.

The steelhead begins to enter the Columbia in the fall, and is then in prime condition. Like the quinnat, it ascends rivers for long distances, and has been found almost as far up the tributaries of the Columbia as the ascent of fish is possible. Since the greatest quantities of steelheads are caught in the spring, when the fish are spawning and are in a deteriorated condition, they are not generally esteemed as food, but when they come fresh from the sea and are in good condition, their flesh is excellent. As the demand for salmon has increased, steelheads have been utilized for canning, and they form a noteworthy part of the canned salmon from the Columbia River. In Washington, where they are regarded by law as a sport fish, their capture or processing for sale is prohibited, but they may be taken for commercial purposes in Oregon.

ARTIFICIAL PROPAGATION

The first steps in an effort to restock with salmon the rivers of the eastern coast of the United States were undertaken by Massachusetts and New Hampshire about 1865. At first eggs were obtained from Canada, but this source was cut off, and the authorities were compelled to attempt to get eggs by capturing salmon in the spring at the mouth of the Penobscot River in Maine, and keeping them alive and well until they spawned in November. After some experimentation a few live salmon were safely caught and carried in floating cars to Craig Brook, near the mouth of the Penobscot, where ponds and hatcheries fed by a clear stream had been prepared for them. The fish throve; year by year quantities of eggs were obtained and shipped to other places to be hatched. In 1889 the Craig Brook station was acquired by the federal government and enlarged into a regular establishment for the rearing of fry, on an extensive scale, to the age of six or seven months. Later other establishments were opened for the rearing and distribution of landlocked salmon. Still more extensive operations in salmon culture were undertaken on the Pacific coast to replenish the rivers of California and the Columbia Basin, millions of fry (principally quinnat) annually being artificially hatched, reared, and placed in the headwaters of the various rivers.

SALMON RIVER MOUNTAINS, mountain range, Idaho, situated principally in Valley, Custer, and Lemhi counties, north of the Sawtooth Mountains. The highest peaks are Twin Peaks (10,328 feet) and Bald Mountain (10,314 feet). The Salmon River, which rises in the range, has carved a number of canyons through it. The mountains are thickly wooded, and the range includes parts of the Salmon and Challis national forests.

SALMONBERRY, a raspberry (*Rubus spectabilis*) native to the Pacific coast from Alaska south to California and east to Idaho. It is cultivated both for its edible, salmon-colored berries and for its reddish flowers. The name is also applied to *R. parviflorus,* a western species of raspberry with white flowers and inedible fruit; and, improperly, to the cloudberry.

SALMONEUS, săl-mō′nūs or săl-mō′nē-ŭs, in Greek mythology, one of the six sons of Aeolus, the wind god. He became king of Elis in the Peloponnesus. Possibly as a rite to produce rain, he dragged bronze kettles after his chariot to imitate thunder and threw torches to imitate lightning, meanwhile crying out that he was Zeus himself. For this impiety he was immediately killed by a real thunderbolt.

SALMONIDAE, săl-mŏn′ĭ-dē, a family of highly organized freshwater and anadromous fishes of the northern parts of the world. It includes the salmons, trouts, whitefishes, ciscoes, and sheefishes.

SALOL. See SALICYLIC ACID AND RELATED COMPOUNDS.

SALOME, sȧ-lō′mē, a Hebrew feminine name common in Palestine in the time of Christ. Its most notable bearer (14 A.D.?–before 62 A.D.) was the granddaughter of Herod the Great and daughter of Herodias and Herod Philip. Though not mentioned by name, she is the damsel in Matthew 14:3-11 and Mark 6:17-28 who is instigated by Herodias to ask of Herod Antipas the execu-

tion of Saint John Baptist. Josephus says she first married Philip the tetrarch, son of Herod the Great and Cleopatra, and afterward Aristobulus, son of Herod, King of Chalcis, her cousin-german, by whom she had several children. The name was also borne by Zebedee the mother of James the Elder and John the Evangelist, one of those women of Galilee who attended Jesus in his journeys and ministered to him. (Matthew 27:56). She asked of Christ for her sons a special place of honor in his kingdom (Matthew 20:21); and was a witness of the Crucifixion (Mark 15:20). Some infer, from comparing Matthew and John 19:25, that she was a sister of Mary the mother of Jesus.

SALOMON, Haym. American Jewish financier: b. Lissa, Poland, 1740; d. Philadelphia, Pa., Jan. 6, 1785. But meagre details are preserved of his early career, but his record as an American patriot and his services in aid of the government in Revolutionary days are well known. He was called "the good Samaritan" by S. H. Gay in his life of James Madison, and is referred to by Madison as rejecting all recompense for the pecuniary help bestowed. He was a prisoner in New York in 1775, and in 1778 escaped to Philadelphia. There acquiring wealth as a banker, he freely loaned to Robert Morris over $350,000. He negotiated all the war subsidies from France and Holland and when Continental money was withdrawn, causing suffering among the poor of Philadelphia, he distributed $2,000 in specie to relieve distress. The large indebtedness of the government to Haym Salomon was never repaid to him nor to his heirs and has been the subject of some discussion. It was favorably reported to the United States Senate in 1850. Although the amount of public securities and Revolutionary papers filed in the register's office, Philadelphia, Feb. 15, 1785 reached $353,744, the inroads of the British army in 1814 destroyed every record in relation to the vouchers. On Feb. 24, 1893 a bill was presented to the House that a gold medal be struck off in recognition of Haym Salomon's services, his heirs to waive all claims for indemnity; but the measure, although reported favorably, was too late for consideration.

SALOMONS, Sir David Lionel Goldsmith-Stern, English electrical engineer: b. June 28, 1851. He was mayor of Tunbridge Wells in 1895, and was vice president of the Institution of Electrical Engineers. He published *Electric Light Installations; Photographic Formulae;* and various monographs on electrical topics.

SALON, sä-lôn', **The Paris,** (1) the large gallery in the Louvre, in Paris, in which art exhibitions were formerly held; (2) a name given the annual art exhibition in Paris; (3) the leading galleries where modern artists exhibit their works; (4) an apartment for the reception of company; in the plural, fashionable assemblages, or circles of fashionable society. See Paris.

SALON (-de-Provence), town in the department of Bouches-du-Rhone, in southeast France, about 40 miles northwest of Marseilles. A center of manufacture and trade in olive oil and soap. It has churches dating back to the 12th and 14th centuries, and remains of Roman walls. Pop. (1936) 9,047.

SALONA. See Solin.

SALONIKA, sä-lô-nē'kà, since 1937 officially **THESSALONIKE,** thĕs-à-lô-nyē'kyē, ancient Therma, which later became Thessalonica, seaport in the Greek Department of Macedonia. Transferred to Greece in 1913, at the close of the Balkan Wars (q.v.). Until then Salonika had been the capital of a Turkish vilayet of the same name. Situated on the Gulf of Salonika, in the Aegean Sea, 315 miles southwest of Constantinople, the town occupies a fortified slope, and, surrounded by stately cypresses and lofty white walls, ascends from the shore in triangular form. Its architecture is characteristically Oriental, the early Christian churches having been converted into mosques. Chief of these is Saint Sophia, similar to the celebrated mosque of that name in Constantinople, on a smaller scale, but beautiful; the church or mosque of Saint George (with walls 20 feet thick), which contains early Christian mosaics dating from 400 A.D.; Saint Demetrius, destroyed by fire in 1917, had a fine interior; and various others, besides Greek churches and Jewish synagogues. The numerous antiquities include the Citadel, or ancient Acropolis, with its seven towers, called by the Turks *Yedi-Kuleh,* containing a triumphal arch which dates from the time of Marcus Aurelius; the Propylæum of the Hippodrome, a splendid Corinthian colonnade of five pillars; the triumphal arch of Augustus, commemorating the battle of Philippi; the arch of Constantine, etc. There are large bazaars, and aqueducts bring water from the distant hills to the city. Salonika, however, was also characterized by much squalor and miserable quarters, though considerable improvements have been introduced under Greek rule. Since the construction of various railway systems and harbor improvements, the trade, already considerable, has increased. The exports consist of corn, cotton, wool, tobacco, silk cocoons, opium, wine, brandy, skins, antimony and timber; the imports, of sugar, flour, coffee, coal, iron and hardware, petroleum, salt, rice, glass, etc. Great Britain had the largest volume of trade before the war; next in importance were Italy, France, Austria-Hungary and Turkey. Salonika (formerly Therma) is mentioned in historical annals, in connection with Xerxes' march through Greece. It was refounded by Cassander in 315 B.C. Saint Paul preached here and addressed two of his epistles to the converts of this place (Thessalonians). During the Roman-Macedonian wars it figured as the chief station of the Macedonian fleet. After the civil wars it became the first city in Greece. It was a seat of the Christian Church at a very early period. During the barbarian invasions, it was the most important stronghold and place of defense of the Eastern empire. In mediaeval times it was taken (904) by the Saracens; (1185) by the Sicilian Normans; (1430) by the Turks. The area is 3,358 square miles; the population (1938) 539,697.

During the first Balkan war Salonika surrendered to the Greeks with a Turkish army of 29,000 under Hassan Tahsin Pasha on Nov. 8, 1912. In the course of the European War Salonika was the scene of violent international complications owing to the failure of Greece to come to the assistance of Serbia against

Bulgaria, as stipulated by treaty. On Aug. 18, 1917, a great fire broke out in the town and burnt for two days. Quite two-thirds of Salonika proper was destroyed and 100,000 persons rendered homeless. All the banks, business premises, hotels and most of the theaters were reduced to ashes. Only the bare walls of the old Byzantine Church of Saint Demetrius remained standing. By arrangement with Greece in 1923 Yugoslavia has a free zone in the harbor of Salonika. A project for reclaiming the marshlands was begun in 1935. The city was taken by the Germans in World War II, but in Oct. 1944 was retaken by the Greeks. See also GREECE; VENIZELOS, E.; WAR, EUROPEAN; WORLD WAR II.

SALONIKA, Gulf of, or THERMAIC GULF (ancient THERMAICUS SINUS), is the extreme northwestern arm of the Aegean Sea, between the peninsula of Chalcidice and the coast of Thessaly. Its length is about 85 miles; breadth, 50 miles.

SALPA, săl'pà, a genus of free-swimming ascidian of the order Thaliacea, and the family Salpidae. They are met with as single or solitary organisms and as aggregate or compound collections, the so called "salpa chains," but these are states of the same species. The solitary salpa produces by budding from a process termed the stolon, a long chain of aggregated embryos, which become the salpa chain. The individuals of this compound chain have the power of producing, by means of eggs, new solitary salpae. This is one of the instances brought forward by Johann J. S. Steenstrup in illustration of his views of the alternation of generations. The entire life-history, however, is not so much one of an alternation of generations as of a process of budding (asexual), alternating with reproduction by means of eggs (sexual). Thus, the first salp produces aggregate salps which are unlike itself, but the aggregated salps produce solitary salps unlike their parents, but resembling their grandparents. Each salpa is of oval or quadrate form, with an aperture at either extremity. Locomotion is effected by the expulsion of water from the posterior aperture, and the salpa chains thus swim over the surface of the ocean. The principal organs of the body are compacted to form the so-called "nucleus." The salpae are beautifully transparent and colorless and often phosphorescent. They abound in the waters of the Gulf Stream and in the Mediterranean.

SALSIFY, săl'sĭ-fĭ, a biennial composite (*Tragopogon porrifolius*), sometimes attaining four feet in height. The genus is popularly known as Goat's Beard, because of the long silky beard or pappus of the seeds. It grows wild in the south of Europe, but is cultivated as a vegetable. It has narrow grass-like leaves and solitary showy purple heads of ligulate florets, the involucre consisting of lanceolate leaflets much longer than the florets. The flowers close before noon. The fruits are plumed and float through the air like those of a dandelion. Salsify is hardy and has a very long tapering tap-root, white and fleshy, and with a flavor resembling oysters, whence it is sometimes called vegetable oyster or oyster plant. Black salsify (*Scorzonera hispanica*) comes from Spain and is closely allied to the true salsify. It has a root like that of *Tragopogon,* except that it has a blackish skin. The leaves are undulate and the flowers yellow. The plant was once used for snake-bites.

SALSILLA, săl-sĭl'à, the common name of several species of the amaryllidaceous genus *Bomarea,* which produce edible tubers. Some are cultivated in greenhouses for their large gorgeously spotted flowers, borne in cymes on twining stems, and *B. edulis* is cultivated in the West Indies as a vegetable.

SALSOLA, săl'sô-là, a genus of the Chenopodiaceae family, with about 50 widely distributed species growing in saline soils, or on seashores, popularly known as saltwort. The small, axillary flowers are apetalous, but have a five-parted calyx, which in fruit encloses the utricle, and has a broad, horizontal, membranous wing. A maritime species (*S. kali*), the prickly saltwort, is a familiar spiny annual, its decumbent branches spreading from the central tap-root so as to form large rosettes on the sand. The closely-set rigid leaves radiate in all directions; they are small, awl-shaped and succulent, the mid-vein ending in a strong prickle. It is a widely diffused species and like some other plants of the same family, was formerly collected and burned for the impure carbonate of soda found in its tissues. Lumps of the fused ash were an important article of commerce, called barilla (q.v.), and yielded about 50 per cent of soda, being the original source of that chemical.

SALT, sôlt, **Henry Stephens,** English biographer: b. Nynee Tal, India, 1851; d. Brighton, April 19, 1939. He was educated at Cambridge and subsequently engaged in literary work and social reform. He was honorary secretary of the Humanitarian League from its founding in 1891 and editor of *The Humanitarian* and *The Humane Review.* He published *Life of James Thomson; Life of Henry D. Thoreau; Richard Jefferies: His Life and His Ideals; Percy Bysshe Shelley: Poet and Pioneer; Tennyson as a Thinker; Animals' Rights; The Logic of Vegetarianism; Company I Have Kept;* and edited *Songs of Freedom; Kith and Kin* (poems of animal life), and works by Godwin, Thoreau, Melville, etc.

SALT, SIR **Titus,** English manufacturer: b. Morley, Yorkshire, Sept. 20, 1803; d. Bradford, Dec. 29, 1876. He was the first to introduce the manufacture of cloth from the wool of the alpaca into England (1836). The model village of Saltaire (q.v.), three miles from Bradford, on the river Aire, was built in 1853 for the workmen engaged in his factories. He was a member of Parliament in 1859, and in 1869 was made a baronet.

SALT, a term which to the chemist means a certain kind or type of chemical compound, and to the general public a single substance, often referred to as common salt and known in chemistry as sodium chloride. The two meanings will be discussed separately.

The old and still very common definition of a salt as a chemical compound is "the product of the action of an acid on a base." If a solution of sodium hydroxide, NaOH, is mixed with a solution of hydrogen chloride, or hydrochloric acid, HCl, and the water is removed by evaporation, the single substance which remains is sodium

chloride, NaCl, a salt. In the more modern understanding of the reaction by which salts are formed, the sodium hydroxide in water solution is broken up into sodium ions, each of which has a positive charge and hydroxyl ions, each bearing a negative charge. Water is very slightly ionized and hydrogen ions in hydrochloric acid come from the hydrogen of hydrogen chloride, the negative ions being atoms of chlorine, each of which carry an extra electron, or the chloride ion. When the two solutions are mixed the hydrogen ion, which is now thought of as a proton, H^+ attached to a molecule of water, or H_3O^+, reacts with the hydroxyl ion, OH^-, to form another molecule of water. What is left in solution is an equal number of sodium ions, Na^+ and chlorine ions, Cl^-. If the water, which separates these ions and insulates them from each other, is removed by evaporation, a salt, NaCl, is left as a solid.

With very few exceptions salts are completely ionized in water solution, but the full electrical effects are not evident except in quite dilute solutions because of the interference of oppositely charged ions with such operations as carrying an electric current, lowering freezing points, and elevating boiling points. In the first case, the amount of current carried is less than theoretical, assuming each ion to be responsible for carrying or giving up one or more electrons according to the individual charge. In the second and third cases, the effect on freezing point and boiling point is much less than if the salt did not ionize at all but somewhat less than if the ions were free to exert their full effects as do molecules of glycerin or sugar in solution.

The modern definition of a salt is then a substance made up of some positive ion other than hydrogen and of some negative ion other than hydroxyl. The positive ion may be a metal such as sodium or calcium or it may be made up of a group of elements such as the ammonium ion NH_4^+ or a group of elements containing carbon as well as nitrogen and hydrogen. The negative ion may be a simple element such as chlorine or bromine, or it may be a group such as the sulphate ion, $SO_4^=$, or nitrate ion, NO_3^-. An acid salt is one which still contains some of the hydrogen of the acid, such as $NaHSO_4$, and an "oxy" or "hydroxy" salt (a better term than basic salt) contains either an oxygen atom or one or more hydroxyl groups. Thus BiOCl is bismuth oxychloride and $Bi(OH)_2Cl$ is a hydroxy salt from which the oxy salt can be derived by loss of a molecule of water. There are also double and complex salts, in which two or more simple salts crystallize together in definite proportions.

If both the acid and the base from which the salt is derived are extensively ionized, the salt in water will be neutral in reaction, that is the hydrogen ion concentration of the solution will be about that of water. If one or the other is slightly ionized, the salt in water solution will show an acid reaction or a basic reaction depending on whether the un-ionized base or acid is produced by the action of water.

Turning now to the substance with which everyone is familiar, sodium chloride, or common salt, this is a widely occurring and most useful substance. The element chlorine is found in the earth's crust only to the extent of about 0.2 per cent, while sodium represents 2.6 per cent. This would mean about twenty atoms of sodium to one of chlorine, the remaining sodium being tied up in other minerals, mostly as insoluble silicates in rocks. Yet nearly all useful sodium compounds are made from sodium chloride. This is not only because of its wide distribution and availability, but because sodium chloride is soluble in water while the complex silicates holding sodium as a constituent are not. The oceans of the world contain the larger part of the sodium chloride in the earth's crust. Sea water contains about 2.8 per cent by weight of sodium chloride, the total content of dissolved substances being less than 3.7 per cent. Some inland seas, in which there has been extensive concentration by evaporation and building up of dissolved solids by streams containing substances dissolved from minerals, contain much larger amounts of salts. The Great Salt Lake in the United States is a 15 per cent solution of salts, of which about four fifths is sodium chloride. The Dead Sea is nearly double that concentration of dissolved material, but sodium chloride constitutes only about two fifths of the total solids of that body of water.

There are deposits of solid salt all over the world, some of them several thousand feet in thickness. Along the Gulf coast of the United States, water bringing salt from great depths has deposited the salt, and as the solid crystallized it pushed up the overlying rocks into the familiar ones which are associated with salt, gypsum, petroleum, and sulphur. Underground streams flowing through salt deposits are often tapped by wells from which brine of high concentration is drawn.

The common chemical and physical properties of sodium chloride follow. This salt is remarkably stable even at high temperatures. It melts without decomposition at 800°C. and becomes a vapor at 1440°C. Dry salt reacts with concentrated sulphuric acid because hydrogen chloride is a gas and is removed as rapidly as it forms. An electric current passed through molten salt produces metallic sodium and gaseous chlorine. When such a current is passed through a concentrated solution of sodium chloride, the products are chlorine and hydrogen as gases, sodium and hydroxyl ions being left behind. This reaction will be referred to again under industrial uses of salt. Sodium chloride crystallizes in the form of cubes, and also the arrangement of atoms in the crystal is the simple cubical structure, with alternating sodium and chlorine atoms at the corners of each cubical cell of which the crystal is composed. The sodium has passed over its single valence electron to the chlorine and each atom is charged just as it is in solution. As salt is used in the household and commercially, its crystals are small cubes, and larger crystals are usually cloudy, but salt can be grown by very slow cooling into large and perfectly transparent cubes for optical instruments. Since there is a tendency for the crystal to take up a small amount of water from damp air, such instruments must be used in air-conditioned rooms in which humidity is relatively low. The solubility of salt in water does not change materially with temperature. At the freezing point of water, 100 grams of water will hold 35.6 grams of salt in solution, and at the boiling point of water, only 39.1 grams will be in solution in 100 grams of water. This property is useful in the crystallization and recovery of salt industrially.

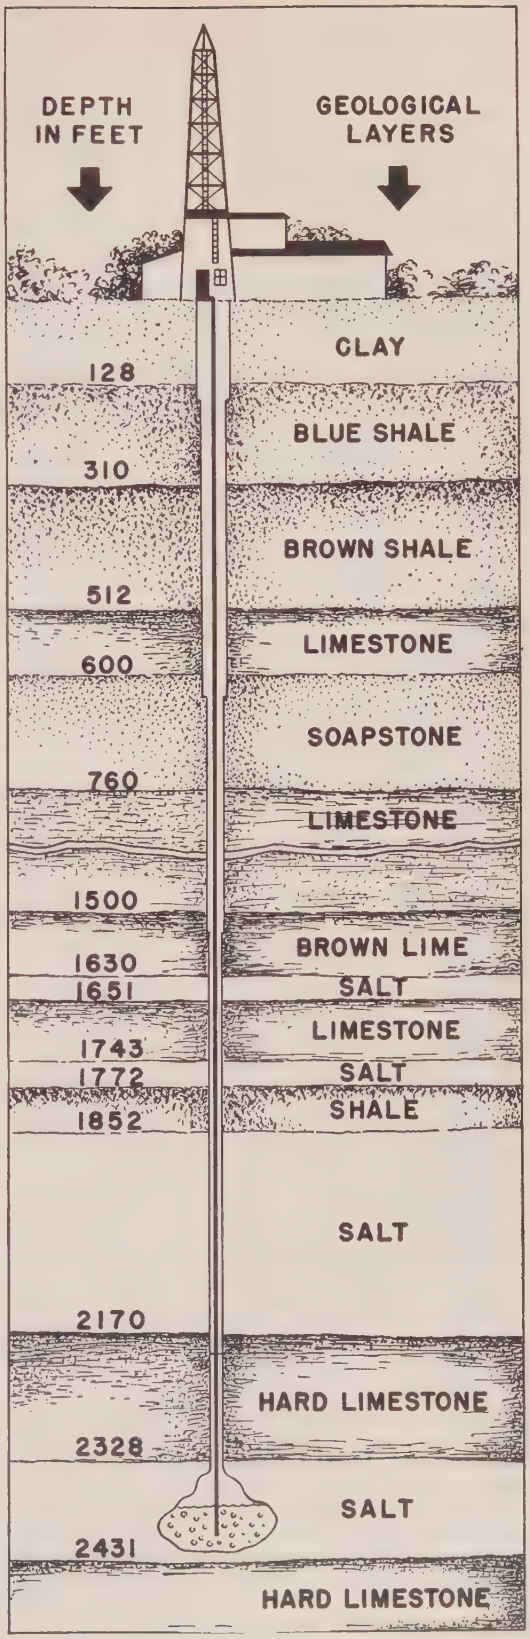
Because of its wide distribution salt has been used by man as far back as there are historical

records. In sections where salt was scarce, its commercial value was very high. The common word "salary" is derived from the Latin word *salarium,* or money allowed to soldiers for the purchase of salt. Much of the salt in general use in ancient times must have been quite impure, containing insoluble earthy material. This would account for the Biblical phrase in which salt is referred to as having "lost its savour" and thus fit only "to be trod underfoot" (Matt. 5:13). Such crude salt exposed to water would readily lose its true salt content with only clay or marl left behind.

While any extended discussion of the physiological effects of salt is beyond a review of this type, it is certainly true that common salt is an essential part of the diet of man, and particularly of herbivorous animals. Considerably more salt is demanded in modern foods than is utilized, the remainder being excreted. Gastric juice in man contains about 0.6 per cent hydrochloric acid, the source of the chloride being sodium chloride. When perspiration is excessive, as in the case of steelworkers, salt tablets are provided in modern plants, so that the loss of sodium chloride through the skin may be made up and resulting weakness may be avoided. A physiological saline solution, sometimes confusingly called a "normal solution," is one which has the same osmotic pressure as the liquid within blood cells, and is therefore "isotonic" with the blood. (Chemists define their normal solutions as containing the gram equivalent weight of a substance in one liter of solution. A physiological salt solution has less than one seventh as much salt in a given volume as a normal solution of sodium chloride as prepared by a chemist.) In certain conditions of the body, salt or any other ionizable sodium compound is practically excluded from the diet. Fairly recently it was proposed to substitute lithium chloride for sodium chloride and some was actually used by such patients. A thorough investigation by the United States Food and Drug Administration, based on extensive animal experimentation and clinical records, has proved that lithium chloride has distinctly toxic effects, particularly when consumed by those on a salt-deficient diet, and its use should be strictly avoided.

A serious agricultural problem is presented by the presence in soils of alkali salts, of which sodium chloride is typical. Alkali soils are in general quite unproductive and represent a very large and important proportion of the soil resources of the world capable of reclamation by modern methods. An important phase of the problem is the presence in soil of base exchange minerals. The part played by irrigation water is significant. Depending on the way in which water is applied to soil and the saline content of the water, soils may become more alkaline or the alkalinity may be reduced. The chief solution of the problem lies in the complete removal of alkali, prevention of its return, and repair of damage done. By proper irrigation methods, alkali salts may be removed from the soil to a depth to which plant roots reach and the rise of alkali from underlying layers prevented. Some methods of amelioration are of partial value. A recent example of soil reclamation is that of the farm land of Holland flooded by sea water during the German invasion.

Salt is produced in quantities exceeding most if not all other commercial chemicals and also exceeding most metals except iron. The peak of



Courtesy General Foods Corp.

A typical salt well, 2,400 feet deep.

production in the United States was reached in 1948, amounting to 16.4 million tons. The figure for 1949 was about 5 per cent lower than this, but higher than that of any other year except 1947 and 1948. World production is over two and one half times that of the United States. In the United States, the production by states in 1949 was distributed as follows:

Michigan	26	per cent
New York	19	" "
Ohio	14	" "
Louisiana	13	" "
Texas	11	" "
California	6	" "
Kansas	5	" "
Other States	6	" "
	100	per cent

SALT PRODUCTION IN THE UNITED STATES

	1935–1939 average	1942	1943	1944	1945	1946	1947	1948	1949
Evaporated	2,507,374	3,517,832	3,476,501	3,448,578	3,182,570	3,249,457	3,158,718	3,207,403	3,284,361
In brine	4,205,587	7,373,165	8,478,513	8,820,355	8,705,831	8,470,680	9,140,811	9,349,044	8,838,331
Rock salt	1,947,254	2,802,287	3,259,138	3,448,238	3,505,740	3,412,008	3,754,353	3,846,846	3,468,005

Considerably over half the sodium chloride sold or used as such is in the form of a concentrated brine. The remainder is fairly evenly divided between rock salt, mined and sold as a solid, and salt produced by evaporation of brines and crystallization, the former being slightly higher.

The average purity of rock salt is of the order of 98 per cent and it is used without further purification. Limited amounts of salt are produced by solar evaporation of sea water or water from salt lakes, but this is a minor source of this mineral in the United States, and is limited to regions where evaporation greatly exceeds rainfall. The brine is run first into shallow ponds and drops out sparingly soluble substances such as calcium carbonate and calcium sulphate. The partially purified and somewhat concentrated solution is run to another set of ponds in which a fairly pure sodium chloride crystallizes and is deposited. The remaining solution, called a bittern, contains the more soluble potassium magnesium, and calcium chloride is drawn off and discarded. The most common method of producing sodium chloride from brines is in multiple effect vacuum evaporators, in which heat is supplied to the first of a series of evaporators by steam in coils or in steam chests through which the brine circulates in pipes. A vacuum pump and condenser are connected to the last evaporator in series or the last "effect." Steam coming from the brine in the first effect is passed into the steam chest of the next evaporator in line, where it condenses and produces a vacuum over the liquid from which it came, its latent heat of condensation causing the brine around the steam chest into which it entered to boil. The vapor from this effect passes on to the next and so on until the last, whose vapor is condensed by cool water, the vacuum in this effect being produced by a pump. Such evaporators are usually equipped with conical bottoms connected to receivers called salt boxes in which the salt collects. The brine usually has a preliminary treatment with lime to remove most of the impurities. A somewhat inefficient system of evaporation still continues to be used because of the special quality of the salt crystals produced. In this system evaporation is brought about in a "grainer," an open pan or trough with steam coils raised slightly above the bottom. The tiny cubes of salt formed at the surface float for a time because of surface tension, and become surrounded by a rectangular rim. The crystal ultimately takes the form of an inverted hollow pyramid called a "hopper crystal," which sinks to the bottom of the grainer and is drawn out on a drain board and to the discharge end by reciprocating rakes. An ingenious method of removing insoluble products such as calcium sulphate is to pass hot concentrated brine through cylinders packed with pebbles. The undesirable material deposits on the pebbles. At intervals the cylinder is drained, rotated like a ball mill, and the deposit is ground off and discarded. Final crystallization in this case is in grainers.

The most familiar use of salt is in the seasoning of food in the kitchen and at the table. In damp weather salt takes up moisture and tends to cake. This is avoided by adding harmless substances such as magnesium carbonate, soda, calcium phosphate, and dextrose (corn sugar) in very small amounts. In regions some distance from the sea coast where the amounts of iodine in water and soil are low, a small amount of potassium iodide is added to table salt for occasional but not continual use.

Commercial salt finds many uses in which it is not changed chemically in any way. The preservation of food is probably the most familiar. Salt was at one time mixed with crushed ice in all sorts of refrigeration operations, and one process actually crystallized salt and ice together in thin flakes to produce temperatures well below that of melting ice alone. Modern refrigeration equipment has cut down this use. Salt is still an important material in the leather industry in the preservation of hides. In the older method of soap making in the kettle, dry salt is added at one stage of manufacture to cause the soap to curd and separate, the effect being that of an electrolyte in the coagulation of a colloid. Considerable salt is used on icy sidewalks and streets, and a limited use is recorded in treating unpaved roads. Pressed salt blocks are a common sight in pastures and stock-feeding pens. Freezing brines still contain sodium chloride, but calcium chloride gives a greater lowering of the freezing point and a greater range of cooling.

Finally, sodium chloride is the source in industrial chemistry of metallic sodium, of chlorine, and of practically all sodium and chlorine compounds. Some sodium carbonate and sodium sulphate are derived from natural deposits, but even these substances are derived largely from salt. Fused sodium chloride is broken up by the electric current into metallic sodium and chlorine, the product of principal value in this case being sodium. One of the chief uses of sodium is in the preparation of the common antiknock additive to gasoline, lead tetraethyl. An alloy of sodium and lead is treated with ethyl chloride. When a solution of sodium chloride is electrolyzed, the products are chlorine, caustic soda, and hydrogen,

the last named sometimes being allowed to escape. When mercury is employed as the cathode there is no problem of loss of chlorine by recombination, but when an iron cathode is used, diaphragms are required to keep the chlorine away from the caustic soda, the brine also flowing through the cell with only about one half of the salt being decomposed in each passage. Caustic soda is also made, but in smaller quantities, by the action of lime on a solution of sodium carbonate or soda. This chemical is itself made from salt, ammonia gas being passed into a concentrated brine, after which the ammoniacal brine is treated with carbon dioxide. An insoluble sodium bicarbonate separates, and is converted by heat to sodium carbonate. Since the original bicarbonate is heavily contaminated with ammonia, cooking soda is made by action of carbon dioxide on pure sodium carbonate, or soda ash. While some hydrochloric acid is made from hydrogen and chlorine, the hydrogen chloride being absorbed in water, and some also is a byproduct of other industries, most of this valuable acid is produced by the action of concentrated sulphuric acid on dry salt. Sodium cyanide results from the reaction of fused salt with calcium cyanamide. Other sodium compounds are more commonly made from soda ash or caustic soda, both of which originate from salt. Likewise most other chlorine compounds are made from the chlorine which is made from salt.

Chemical Adviser, Research and Development Division, General Staff, Department of the Army.

SALT LAKE CITY, city, Utah, state capital and seat of Salt Lake County, is situated at an altitude of 4,357 feet in north central Utah, 38 miles south of Ogden. Through the western part of the city flows the narrow, winding Jordan River whose headwaters are 50 miles south in Utah Lake.

The city has a picturesque setting in the Great Salt Valley, along the shoreline of a huge, Pleistocene body of water called by geologists Lake Bonneville. It lies at the foot of the snow-capped Wasatch Mountains, but mountain ranges are visible in all directions. From their canyons, including Provo Canyon in which is located Deer Creek Reservoir, water is brought into the city, assuring an adequate supply in a region where precipitation is light. Most of the city streets are long, straight, and wide; and in the downtown area, except during freezing weather, water flows down the streets and there are continuously-running drinking fountains on nearly every corner. The surrounding agricultural area produces sugar beets, vegetables, fruits, wheat and other grains, livestock, and poultry. The vicinity is rich in such mineral deposits as coal, iron, copper, silver, phosphate, gilsonite, and lead. One of the world's largest nonferrous smelting areas is that within a 50-mile radius of the city. From its farms, ranches, and mines come the raw materials for the city's industries.

Transportation.—The city is served by six railroads: the Union Pacific, the Western Pacific, the Denver and Rio Grande Western, the Bamberger (electric), the Utah, and the Salt Like, Garfield and Western (electric). Salt Lake City is on a network of modern highways, with motor-bus and truck service in all directions. It has two municipal airports and daily scheduled airline service. Nearby are three privately owned fields for charter flights and private flying.

Commerce and Industry.—Situated about midway between San Francisco and Denver, the city occupies a strategic commercial position in the intermountain region. It is that region's leading livestock market, enjoys a large wholesale and retail trade, and has nine banks, including a branch of the Federal Reserve Bank of San Francisco. It is the center of extensive industrial and manufacturing operations. Among its industries are printing and publishing, beet sugar refining, oil refining, copper refining, coking, and the smelting of copper, silver, lead, zinc, and iron. The processing of foods and the manufacture of textiles and of iron, steel, and clay products are also important.

Educational, Cultural, and Recreational Facilities.—Salt Lake City is the state's educational center. In addition to a modern public school system and private and parochial schools, located in the city are Rowland Hall (Episcopalian, girls' academy), Westminster College (Presbyterian, coeducational, 4-year junior), the College of St. Mary-of-the-Wasatch (Catholic, for women), the University of Utah (see Utah, *University of*), and the McCune School of Music and Art. Although Salt Lake City is known as a center of Mormonism, it is less generally known that it is the seat of Roman Catholic and of Episcopal dioceses. A number of other denominations are represented in its places of worship. Library facilities include the Salt Lake City Free Public Library, the Utah State Library, and the Church Historian's Library of the Mormon Church, which last includes much source material relating to the history of Utah. The cultural life of the city is also enriched by the Utah Symphony Orchestra, the Salt Lake Opera Association, the famous Tabernacle choir of 375 voices, the organ recitals given in the Tabernacle every weekday, and by the annual music festival sponsored by the university. In the State Capitol are several art collections, most of which represent the work of Utahns. Among paintings of special interest there are two very different portraits by Gordon Cope of the Ute Indian chief, John Duncan. One was painted to satisfy the sitter; the other, to satisfy the artist himself. An art gallery in the university includes a collection of paintings by artists who worked in Utah during its pioneer days. The Art Barn, meeting place of clubs interested in various forms of art, holds exhibits of contemporary artists from time to time. Among collections in the university's museums and in the Latter-day Saints (Mormon) Museum are some unusual archaeological specimens, the artifacts of ancient Indian cultures, and relics of Utah's pioneers and of the Mormon Church. In the Daughters of the Utah Pioneers Memorial Building (a replica of the Salt Lake Theater opened in 1862 and then the largest building in the West) is an unusually fine collection of pioneer relics. A similar collection is housed in the capitol, which also contains exhibits of the state's natural wealth and beauty.

More than 3,200 acres of the city's area are in parks, playgrounds, municipal golf courses, and other recreation centers. In Liberty Park's landscaped 100 acres is a lake used for boating

in the summer and ice skating in the winter. The park also contains a bandstand, an aviary, a hall of pioneer relics, as well as swimming pools, picnic grounds, and other facilities. At the mouth of Emigration Canyon is Hogle Park with a zoo that in 1951 contained a rare hybrid, a crossbreed of lion and tiger, appropriately named a liger. Memory Grove, a park area at the foot of City Creek Canyon, is dedicated to Utah's soldiers who died in World War I. Pioneer Park was developed on the site where the first Mormon settlers built their homes. The city also owns readily accessible mountain parks, including George Washington Memorial Grove, which covers 5,500 acres.

Notable Buildings and Monuments.—The State Capitol stands in 40 acres of landscaped grounds and occupies a commanding position on Capitol Hill. From it, the entire city may be seen. The capitol is a magnificent 4-story building, designed in classical style by Richard K. A. Kletting, a Salt Lake City architect. It is constructed of Utah granite, and its dome is covered with Utah copper. It was erected (1913–1915) at a cost of approximately $2,740,000. In addition to the previously mentioned features in it, the building contains a number of decorative works of art, including four murals and eight canvases representing important events in the state's history, several busts of people of historic importance in Utah, a replica of Cyrus E. Dallin's statue of the Indian chief, Massasoit, and a plaster cast of Dallin's *Signal of Peace*. The governor's reception room, known as the Gold Room, contains furnishings valued at more than $125,000, and its metalwork is of silver and gold mined in Utah. On the capitol grounds is the Mormon Battalion Monument, a memorial to the Mormons who fought for the nation in the Mexican War, designed by Gilbert Griswold. Several structures of interest are found in Temple Square. The basic conceptions of the Tabernacle and the Temple within it are credited to the Mormon leader, Brigham Young. The Tabernacle, designed by William Folsom and constructed in 1863–1867, is a large oval-shaped auditorium 250 feet long, 150 feet wide, and 80 feet high, with an ellipsoid roof and a gallery running almost the entire circumference of the inside of the building. Its seating capacity is 8,000, but it has held much larger audiences. Its original organ was the work of Joseph Ridges, and it was hand-carved and hand-built from native woods hauled by ox-team from the southwest corner of the state. When completed in 1874 it had 2,600 pipes, but since that time has undergone reconstructions and now has 10,746 pipes. The Temple was designed under Brigham Young's direction by Truman O. Angell, one of the first practicing architects of Utah. It is a six-towered edifice of native granite, 186½ feet long and 118½ feet wide, and its greatest height is at the east center tower, which reaches to 210 feet at the top of its stone work. Surmounting this tower is a heroic figure by Dallin in hammered copper covered with gold leaf, representing the angel Moroni of the Book of Mormon. The Temple was built between 1853 and 1893 at a cost of about $3,500,000. To bring the larger blocks of granite the 20 miles from the quarry to the Temple site during the early days of construction required four yoke of oxen and two to four days of time. The Temple and the Temple Annex, with which it is connected by a 90-foot passage, are open to church members only, but in the Assembly Hall, another building in the square, Mormon church services are open to the public. In and around the square are a log cabin erected in 1847, the first year of settlement; the life-size statues of the Mormon prophet Joseph Smith and his brother Hyrum by Mahonri Young, grandson of Brigham Young; the Seagull Monument, also by Young, erected in memory of the birds that saved the pioneers' crops; the Three Witnesses Monument by Utah-born Avard T. Fairbanks, erected to Mormons who played an important part in the church's history; and the Brigham Young Monument by Dallin, memorial to the first pioneers in Utah. At the mouth of Emigration Canyon a simple granite shaft had marked the spot where Brigham Young, traveling down the canyon with his group of settlers, first viewed the valley and is said to have stated, "This is the right place. . . ." Commemorating Utah's first century, a new and imposing "This Is the Place" Monument by Mahonri Young was unveiled in 1947. Of historical interest are the former dwellings of Mormon leaders, the mansions erected for the mining magnates of the late 1800's and early 1900's, and the simple adobe homes that trace back to the city's beginnings. Among non-Mormon church edifices of special interest are the First Congregational Church, erected in 1891 in Gothic style, which stands on the site where, in 1865, the city's first non-Mormon services were held; and the Roman Catholic Cathedral of the Madeleine, a beautiful building of gray sandstone constructed between 1900 and 1909 in German Neo-Gothic style.

Government.—The city has a commission form of government, with five commissioners and a mayor directly elected by the people on a nonpartisan ticket. The auditor is also an elective office. In addition to the municipal airports, the city owns and operates the waterworks. As the capital of Utah and seat of Salt Lake County, most of the functions of state and county government are centered in the city. There the federal government also maintains Fort Douglas, a veterans' hospital, a district court, and other agencies; and has made the city the headquarters for the National Grazing Service.

History.—The history of Salt Lake City is closely identified with that of Utah (see UTAH—*History*). Between July 21 and July 23, 1847, vanguards of the Mormon party under the leadership of Brigham Young arrived in the desert valley where Salt Lake City was to grow, and immediately began to insure a food crop for the winter. Young, who had been ill but had chosen the general location, arrived on the 24th with the main body of his group. Almost at once he selected the exact site for the erection of the Temple. City planning began and the Mormons settled down to a life of isolated self-sufficiency in a place where they hoped to build up the "Kingdom of Christ on Earth." Before September, these members of the Church of Jesus Christ of Latter-day Saints (or Mormons) had plowed, planted, and irrigated 100 acres. They had also filled nearly a block (10 acres) with adobe houses, and built "one line of log cabins in stockade." Despite their efforts, they spent an uncomfortable winter, and food was short. When spring broke, they were joined by other Mormons and, having planted several thousand acres, the prospects for a good harvest were promising; but a late frost and then a plague of crickets

almost ruined their crops, and they were saved from starvation only by the "miracle of the gulls" —huge flocks of the birds which suddenly arrived and, by feasting on the crickets, halted the devastation.

The settlement was under church rule; and all, from the highest of the church's officials to the lowliest of its members, were expected to work. In 1849, the leader of a federal surveying expedition who passed through reported: "A city has been laid out upon a magnificent scale, being nearly four miles in length and three in breadth. . . . Through the city itself flows an unfailing stream of pure, sweet water, which by an ingenious mode of irrigation, is made to traverse each side of every street . . . spreading life, verdure and beauty over what was heretofore a barren waste." That same year, the first store was opened in the "city" and gold seekers on their way to California stopped there to get supplies. The early church leaders encouraged home manufactures and the sale of surplus products, but they discouraged their people from prospecting and mining in the fear that interests would be diverted from the simple, self-sufficient life and that any news of mineral wealth would bring non-Mormons to the area. Until 1858, there were practically no non-Mormons in all of Utah; converts were joining those already there, and new settlements were being established. In 1851, under the territorial government, Great Salt Lake City (as it was called until 1868) was incorporated; but the capital was transferred from that city to Fillmore, where it remained until 1856. The following year (1852), a special conference was called in Salt Lake City by church officials during which polygamy was announced as a Mormon principle. Although the practice is said to have been followed by only two or three per cent of the Mormons, this announcement augmented the prejudices of non-Mormons and the difficulties Mormons long had with the federal government until the church finally reversed its pronouncement. Meanwhile, "open rebellion" in Utah against the United States was said to exist; and, when the news reached Washington, federal troops were despatched to put it down. In 1858, when the troops reached Salt Lake City, they found it deserted, Young having ordered his people to leave. The war was almost bloodless and quickly over, but federal troops remained in Utah until 1861, and before that Salt Lake City's population had returned, and been increased by camp-followers and miners who made of it a headquarters for gambling and drinking. Feeling ran high. Association between Mormon and non-Mormon was practically limited to trade, and that flourished. The lawless period passed but non-Mormons remained, and the first non-Mormon church (Congregationalist) was organized in 1865. During the 1860's the city developed in other ways. A theater was opened in 1862 and made Salt Lake City an important theatrical center. Work was started on the Tabernacle. Non-Mormons organized a Masonic lodge and were instrumental in establishing a public library. The Union Pacific Railroad reached Ogden in 1869, and in 1870 a railroad connected these two cities and gave Salt Lake City transcontinental railroad service. The city's population was already nearly 13,000, and the railroad helped to develop Salt Lake City as a trading and distribution point. It also broke down its isolation, changed it from a barter to a money economy, halted native manufacture, encouraged mining, and brought in more non-Mormons. In 1877, Brigham Young, political and ecclesiastical leader for 33 years and called by his people the Lion of the Lord, died in the city he had founded. In the early 1880's, of about 21,000 in population roughly a third were either non-Mormons or Mormons who had forsaken their church. In 1889, a chamber of commerce was organized in the city which ignored differences in religion, and had much to do with overcoming an ultraconservative attitude toward civic improvements. The character of the city began to take on increasingly more of the characteristics of other American cities. Commercial manufacture, stimulated by World War I, became even more important in the city's economy in World War II. In 1947 the city celebrated its centennial and among the events marking the celebration was a journey of the legislature from Salt Lake City to Fillmore, where one legislative session was held in the old State House occupied by the lawmakers of 1855–1856.

Population.—Reports of the Bureau of the Census show that since the first federal count was taken of the city in 1860, it has been the most populous city in the state. Pop. (1900) 53,531; (1920) 118,110; (1940) 149,934; (1950) 182,121.

SALT LICK, a place where salt is found on the surface of the earth, to which wild animals resort to lick it up; sometimes near salt springs.

SALT RANGE, India, a mountain system in Punjab, Pakistan, beginning on the south side of the Jhelum River, and extending west to the Indus River, reaching an elevation of from 3,200 to 5,000 feet. It consists of two chains running from east to west, which join in a high plateau; the general relief is bleak and dreary, while wildly picturesque. The mountains derive their name from the precipitous hills of solid rock-salt which occur on the border of the plateau. About 60,000 tons of salt are quarried annually, from the Mayo, Warcha, and Kalabagh mines. Coal and other minerals also are found.

SALT RIVER, (1) in Kentucky, has its rise in Boyle County, in the central part of the state; from whence it flows north, then west, then north by west to the northern boundary of the state, where it enters the Ohio River at Westpoint, about 20 miles southwest of Louisville. It is about 100 miles long; and the chief tributaries are Rolling Fork, East Fork and Beech rivers. (2) A river in Missouri, which has its source in Schuyler County, in the northeastern part of the state, flows south by southeast to Monroe County, turns east, then northeast and southeast, and enters the Mississippi River near the town of Louisiana, in Pike County. It is about 200 miles long, and is formed of three branches, North, Middle, and South Forks. (3) In Arizona, which has its source in Apache County, and flows west into the Gila River in Maricopa County. There is a system of dams (Roosevelt, Horse Mesa, Mormon Flat, and Stewart Mountain) linked by a 60-mile chain of lakes; the water is utilized for irrigation and for water power.

SALTA, säl'tä, or **SAN MIGUEL DE SALTA,** Argentina, (1) capital of a province of the same name, in the elevated and well-watered valley of Lerma (1,202 meters), about

800 miles northwest of Buenos Aires. It is a bishop's see, and has a cathedral. Other important features are: the main square or Plaza on which stand the Cabildo, or capitol; the *Colegio Nacional;* a branch of the National Bank, an orphan asylum, hospital and the above-mentioned cathedral. There is a brisk trade, especially transit trade with Bolivia. It is connected by rail with Buenos Aires and Jujuy. The chief products are corn, tobacco and wood. Pop. 28,436. (2) The province of Salta is situated in the northern part of Argentina, and covers an area of 48,302 square miles. Its frontier borders on Bolivian territory. At the west it is mountainous. The highest summits reach an elevation of 6,000 metres, the plateaus 1,300 to 4,000 metres, and some of the passes 3,600 metres. The Sierra Lumbre and the Sierra de Sanita Maria border on the Andes. The mountains contain rich mineral deposits of gold, silver, copper, nickel, iron and lead. The waterways are numerous: The Vermejo and its tributaries, Rio San Francisco and Rio Balle, and Rio Passage (del Juramento), which joins the Paraná as Rio Salado. The climate depends upon the altitude, and different crops are planted accordingly. The products are sugar, corn, wine and European fruits; barley, potatoes and fodder-crops. The lower slopes and valley contain the pampas; the high summits and plateaus are treeless. The inhabitants are for the most part a mixed race of Spaniards and Calchaqui Indians. Pop. about 175,000.

SALTER, William Mackintire, American author: b. Burlington, Iowa. 30 Jan. 1843. He was graduated from Knox College (Ill.) in 1871; studied for the ministry at Yale and at Harvard and was graduated as B.D. at the latter in 1876; subsequently he studied philosophy, as Parker-Fellow of Harvard University, at Göttingen, and political science at Columbia University. From 1883 to 1908 he was lecturer for the Societies for Ethical Culture in Chicago and in Philadelphia; from 1909 to 1913, a special lecturer for the department of philosophy in the University of Chicago. He is the author of 'On a Foundation for Religion' (1879); 'Die Religion der Moral' (Leipzig 1885); 'Ethical Religion' (1889); 'First Steps in Philosophy' (1892); 'Anarchy or Government? An Inquiry in Fundamental Politics' (1895); 'Walt Whitman' (1900); 'Nietzsche: the Thinker' (1914); 'What is Americanism?' (1925), and various articles in philosophical and literary periodicals. Died, Silver Lake, N. H., 18 July 1931.

SALTILLO, säl-tēl'yō, Mexico, capital of the State of Coahuila; situated on the Tigre River, 65 miles southwest of Monterey, near the border line between that state and its neighbor on the north, the state of Nuevo Leon, elevation 5,249 feet above sea-level. It was given the rank of city in 1827 and named Leon-a Vicario, or Saltillo, by which latter name it is universally known. It was noted for many years for the superiority of the serapes made by the Indians of the vicinity — a distinction, however, which has hardly been maintained in recent years. The battle field of Buena Vista, the scene of the defeat of the forces of Santa Ana, by General Taylor, in 1847, is but five miles distant, and near this are the baths of San Lorenzo. In the immediate vicinity are successfully grown all the fruits of the temperate zone and many which pertain to the tropics. The principal buildings are the Civil hospital, the penitentiary and the Acuñ-a Theatre, and the chief manufacturing establishments are cotton mills, flouring mills and soap and cotton seed oil manufactories. The city enjoys a favorable reputation as a health resort. The three principal educational institutions — the Juan Antonio de la Fuente School, the College of San Juan Nepomenceno and the Normal School maintain creditable museums and there are four public libraries — the State library and those connected with the three schools above named, which altogether contain over 6,000 volumes. The Bank of Coahuila, with a capital of $1,600,000, and agencies of the National Bank, the Bank of London and Mexico and the Bank of Nuevo Leon provide the financial resources of the community. Pop. 36,000.

SALTO, Uruguay, the capital of the department of the same name on the northwest frontier opposite Concordia, Argentina, and at the head of navigation for large vessels on the Uruguay River. It is the shipping port of the surrounding region, a rich stock-raising district, and is 250 miles northwest of Montevideo, the capital of the republic, with which it is connected by rail. Pop. of town 30,000, of department 82,846.

SALTON SEA, a lake in the wide Colorado Desert or Imperial Valley in Imperial and Riverside counties in southeastern California. Under ordinary conditions it is a salt marsh covered in places by shallow lakes, about 30 miles long, 12 miles wide and 280 feet below sea-level. At times of freshets the lakes expand into a water body covering from 40,000 to 50,000 acres. In 1905 and 1906 the basin was flooded by accidental influx of water from irrigation ditches from Colorado River and it became a sea 42 miles long, 10 to 16 miles wide and 93 feet deep covering an area of about 470 square miles. The surface of the water at this stage was 198 feet below sea-level. In 1907 the influx of river water was finally stopped by dikes and for a time the water area diminished because of the great excess of evaporation over the very scant rainfall. Water from the irrigating ditches of the Imperial Valley keep the level of the lake fairly constant, and unless this is diverted it will continue to maintain its present area, despite the heavy loss from evaporation. Terraces slightly above sea-level on the sides of the basin indicate that there was formerly present a lake, called Lake Cahuilla by Blake, which was more than 120 miles long and 30 miles wide. Consult Mendenhall, W. C., 'Ground Waters of the Indio Region, California, with a sketch of Colorado Desert' (U. S. Geological Survey, Water Supply Paper 225, 1911); Newell, F. H., 'Salton Sea' (Smithsonian Institution, Annual Report for 1907); MacDougal, D. T., 'The Salton Sea' (1914).

SALTONSTALL, sâl'ton-stâl, **Gurdon,** American colonial governor: b. Haverhill, Mass., 27 March 1666; d. New London, Conn., 20 Sept. 1724. He was graduated at Harvard in 1684, and became minister of the Congregational church of New London, Conn., in 1691. He succeeded Governor Winthrop as chief executive of Connecticut in 1708. and continued

in office until his death. The Saybrook Convention was suggested by him, and the historic «Platform» largely shaped by him. Through his efforts the first printing press was established in the colony. He was also active in the founding of Yale and in its establishment at New Haven.

SALTPETRE. See NITRATE OF SODA.

SALTPETRE, Chile. See NITRATE OF SODA.

SALTS, a very important class of substances in chemistry. The word salt was first used to designate the solid residue obtained by evaporation of sea water, and as sodium chloride is its chief constituent the term *salt* came to mean popularly that substance alone.

Many other substances besides common salt are known by the general name *salts* because of their similarity to common salt in general physical properties, such as solubility in water, taste, having crystalline form, etc. Some of the most common are saltpetre (potassium nitrate), smelling salts (ammonium chloride), etc.

The chemical meaning of the term salt is quite another thing. While the substances mentioned above are indeed salts in the chemical sense, many other substances, as oil of wintergreen, for example, that have none of the physical characteristics of common salt must also be included under this term. To the chemist, a salt is a chemical compound that may be considered as derived from an acid by the replacement of part or the whole of the hydrogen of the acid by a metal or a «radical» playing the part of a metal. For example, the salt sodium nitrate, $NaNO_3$, is derived from the nitric acid HNO_3, by the replacement of the hydrogen by the metallic element sodium, Na; also ammonium chloride NH_4Cl is derived from the hydrochloric acid HCl by similar replacement of hydrogen by the radical NH_4. The most general chemical conception of the composition of salts is that which formulates them as MxNy, where M is the basic or positive portion and N the acid or negative part of the salt. Both M and N may be either elementary atoms or groups of different atoms acting as single atoms (radicals).

Taking common salt (NaCl) as an example, the positive radical Na may be replaced by another metal, or by a complex group of elements which is positive as compared with the other component of the resulting salt. Likewise, the negative radical Cl may be replaced by some other non-metal, or by a group of elements which is negative as compared with the other component. When solutions of two salts are mixed it is quite common that the positive radicals make a more or less complete exchange of their negative partners. This exchange is called in chemical parlance, «reaction.»

Salts are formed in many ways; one of the most important being by the action of an acid on a base by which water and a salt are formed, the salt differing in properties from both the acid and base used. Thus hydrochloric acid and potassium hydroxide mutually react, the products being potassium chloride and water. $HCl + KOH = KCl + H_2O$. Salts are frequently formed by the action of an acid on a metal. Zinc and sulphuric acid forming the salt zinc sulphate and hydrogen $Zn + H_2SO_4 = ZnSO_4 + H_2$. A very common method for the formation of salts is by the process called double decomposition, whereby two new salts are formed when solutions of two salts are brought together. When a solution of barium chloride is added to a solution of sodium sulphate a white solid separates which is a new salt barium sulphate, while in the solution is another new salt, sodium chloride. $BaCl_2 + Na_2SO_4 = BaSO_4 + {}_2NaCl$.

Salts are often classified as normal, acid, basic and double. An acid having more than one hydrogen atom replaceable by basic atoms or groups may form both acid and normal salts according to whether a part or whole of that hydrogen is replaced. An acid salt is therefore to be regarded as potentially an acid. Sulphuric acid H_2SO_4 can form acid salt $KHSO_4$ and the normal salt K_2SO_4. An acid having three replaceable hydrogen atoms can form three varieties of salts. Phosphoric acid H_3PO_4, for example, can give two acid salts KH_2PO_4, K_2HPO_4 and a normal salt K_3PO_4. A basic salt is one derived from a base having more than one hydroxyl (OH) group and in which all of the hydroxyl groups have not been replaced by acid groups. Basic bismuth nitrate $Bi(OH)_2NO_3$ is derived from bismuth hydroxide $Bi(OH)_3$ by replacement of only one (OH) by the acid group NO_3. An acid salt still contains acid hydrogen and will unite with more base to form a normal salt. A basic salt still contains basic hydroxyl (OH) and will unite with more acid to form a normal salt. A normal salt contains neither acid hydrogen nor basic hydroxyl. The term double salt has been applied to two different classes of compounds, the dividing line between which is, however, often very faint. Acids having more than one replaceable hydrogen atom may form normal salts in which two or more different basic atoms or groups are combined with the acid group, as magnesium ammonium phosphate, $Mg(NH_4)PO_4$ or potassium sodium tartrate $KNa(C_4H_4O_6)$. Another class of double salts is formed by the union of two or more molecules of certain normal salts $K_2SO_4:AL_2(SO_4)_3$, $PbI_2:2KI$, etc. Double salts occur most commonly through the combination of one normal salt with another normal salt. One of these components will be a salt of a strong base which forms acid salts but not basic salts: the other component will be a salt of a weaker base which forms basic salts but not acid salts. That component which is the salt of the strong base, being the more acidic, appears as the negative radical; and the component which is the salt of the weaker base, being more basic, appears as the positive radical. Thus in the formula MxNy, in the case of double salts both M and N are in fact salts, and the double salt a union of a positive radical with a radical simewhat less positive.

Method of Naming Salts.— Part of the name is derived from the basic element or group present; thus those containing sodium are called sodium nitrate, nitrate of sodium, or often nitrate of soda, chloride of soda, etc. The other portion is derived from the acid element or group present. Thus salts derived from nitric acid are called nitrates; from hydrochloric acid, chlorides; from sulphurous acid, sulphites; from perchloric acid, perchlorates. It will be noticed that all but the last syllable is the same as the name of the acid and also

that this last syllable differs according to the last syllable of the name of the acid. An acid with a name ending in *ic* forms a salt with a name ending in *ate* (see exceptions below). One ending in *ous* forms an *ite* salt. A salt in which the acid part is a single element has the termination *ide*, even though the acid name ends in *ic*. Thus sulphur*ic* acid forms sodium sulph*ate;* sulphur*ous* acid, sodium sulph*ite;* hypophosphor*ous* acid, sodium hypophosph*ite;* hydrochlor*ic* acid, sodium chlor*ide*. Sometimes a single acid forms two salts with a single metal. In that case the two salts differ in the number of acid groups attached to one metal atom. Thus iron (ferrum), united with nitric acid forms two salts, $Fe(NO_3)_2$ and $Fe(NO_3)_3$. The first one, containing the smaller number of acid groups, is called ferr*ous* nitrate, while the other is ferr*ic* nitrate.

The naming of acid salts has called into use a few other terms. The acid sodium salt of sulphuric acid $HNaSO_4$ is called acid sodium sulphate or hydrogen-sodium-sulphate. With an acid like phosphoric H_3PO_4 having three acid hydrogens, we have H_2NaPO_4 di-hydrogen-sodium-phosphate or primary sodium phosphate, HNa_2PO_4 hydrogen-di-sodium-phosphate or secondary sodium phosphate. The normal salt Na_3PO_4 is also called tertiary sodium phosphate.

As has been said, the terms salt, salts, sal are often applied to various substances of household or medicinal use. A few of the most common are given below with a list of their correct chemical names. Sal soda, sodium carbonate; Epsom salts, magnesium sulphate; Rochelle salts, sodium potassium tartrate; saltpetre, potassium nitrate; sal ammoniac, ammonium chloride; salts of tartar, potassium carbonate; Glauber salts, sodium sulphate. See REACTION; SOLUTIONS.

SALTUS, sôl'tŭs, **Edgar Evertson**, American author: b. New York, N. Y., Oct. 8, 1855; d. July 31, 1921. Educated in French and German universities and at the Columbia Law School, Saltus first published a biography of Honoré de Balzac (1884), *The Philosophy of Disenchantment* (1885), and *The Anatomy of Negation* (1886), the last two a result of his studies in Germany. In his later years he became a theosophist. Much of his early fiction dealt with New York society, but he wrote historical novels and *Imperial Purple* (1893), a history of the Roman emperors that was one of his best-known works. His original and bizarre style was pleasing to many readers in the 1890's—the "Mauve Decade."

SALTVILLE, Engagement at, a Civil War battle. The extensive saltworks at this village in southwestern Virginia furnished the Confederate armies and a number of Southern states with their supply of salt. Not until the third year of the war did the Union forces make any serious efforts to destroy the works. On May 2, 1864, Gen. George Crook started from Charleston on the Kanawha in West Virginia to join Gen. Franz Sigel in the Shenandoah Valley. A column of 2,600 cavalry under Gen. William W. Averell was directed to destroy the works at Saltville and then to rejoin the main column under Crook. After a very difficult march through the mountains, Averell reached Tazewell Court House, where he learned that Saltville was well defended by earthworks and artillery and was held in strength by Gen. W. E. Jones. Accordingly, he abandoned the idea of an attack, and after a severe engagement at Wytheville on the 10th, joined Crook at Union on the 15th.

Late in September 1864 Gen. Stephen G. Burbridge, with a mounted force of about 5,000 men, advanced through eastern Kentucky to Prestonsburg and up the Levisa Fork of the Big Sandy River toward Saltville. He was met 23 miles from the town by a small brigade of Confederate cavalry, which delayed him two days, thus enabling Gen. John C. Breckinridge to gather about 3,500 men at Saltville. When Burbridge appeared before the town on October 2, he found the saltworks well defended, with Breckinridge in command. He made an immediate attack and was stubbornly resisted, but after a hard struggle he gained the right and center of the Confederate works. The Confederate left resisted all his efforts, and at 5 P.M. Burbridge withdrew from the contest, and abandoning his dead and wounded, marched all night toward Prestonsburg, there continuing his retreat. On Dec. 12, 1864, Gen. George Stoneman, with 5,700 men, started from Bean Station, Tenn., on a raid into southwestern Virginia. He attacked Saltville, carried it on the 20th, burned the town and destroyed the saltworks. See STONEMAN'S RAID FROM EAST TENNESSEE INTO SOUTHWESTERN VIRGINIA.

SALTYKOV, Mikhail Egrafovich, Russian satirist: b. Tula Province, Jan. 15(27), 1826; d. St. Petersburg, April 30 (May 12), 1889. Under his pen name N. SHCHEDRIN he wrote the *Golovlev Family* (1876), which was his masterpiece, also a satirical history of Russia. Other works include *Messieurs et Madames Pompadours* and *History of a Town.*

SALUTES AND HONORS. Formalized gestures of respect to persons of superior rank have existed in all periods of history and in all cultures. They have taken many forms, including bowing, kneeling, prostrations, and various gestures of the hand and arm. The basic individual military salute —the raising of the right hand to the forehead or to the hatbrim or vizor—is a relatively recent development. Until the end of the 18th century junior officers saluted superiors and soldiers saluted officers by merely doffing the hat. Civilians still doff hats in a gesture of respect that may well hark back to the custom of the medieval knight who raised his helmet's vizor or uncovered his head before a feudal lord. The discontinuance of hat doffing by the military is attributed to a change of regulations made to spare at least the hats from the griming effects of black powder on hands during discharges of musketry. In the British and Dominion armies until 1918 the hand farthest from the saluted officer was used.

Soldiers armed with a rifle or carbine salute variously, depending on whether they are standing at order arms or marching with the piece at shoulder arms. A halted body of infantry salutes on command by presenting arms. An officer or soldier carrying a sword or saber at the shoulder, whether mounted or on foot, salutes by bringing the hilt to his mouth, then extending the point to the right and downward. The origin of this form of salute dates to the Middle Ages, when knights in a reli-

gious gesture kissed the hilts of their swords as symbolic of the cross of Christ. It was then a form of oath taking.

Salutes by artillery fire, whether by land or naval guns, are determined by service regulations of the various countries. However, such salutes rendered to friendly powers, or to their chief executives or sovereigns, always correspond exactly to those rendered by the saluters to their own nations and chief executives. Thus in France and the United States, where the salute to the flag, and *ipso facto* to the president, is 21 guns, a visiting president, chief magistrate, or sovereign likewise receives a 21-gun salute, the only difference appearing in the playing of the visitor's rather than the saluter's national anthem after the firing.

Regulations in Great Britain provide that a salute of 62 guns be fired for the birth, accession, or coronation of a sovereign. For "extraordinary and triumphal occasions," such as the opening, closing, or proroguing of Parliament by the sovereign, the salute is 41 guns.

Artillery salutes are sometimes "by salvos," that is, by the simultaneous discharge of several pieces of artillery, sometimes by hundreds of guns. Although the term salvo derives directly from the Latin *salve*, hail!, and so suggests a friendly greeting, it is often used in the sinister sense of mass synchronized gunfire at an enemy. Especially is this true of naval gunfire, corresponding to the volley fire of infantry. Until recent times gun salutes were fired with live ammunition. The failure to render such courtesies down to the end of the 18th century was a frequent cause of bad international relations and sometimes of hostilities.

In the United States a general of the armies and all cabinet members are entitled to 19-gun salutes, followed by four ruffles of the drum and flourishes of the trumpet, but with a terminal march rather than the national anthem. At all American army posts the signing of the Declaration of Independence is commemorated on July 4th by a 48-gun salute "to the Union," one gun for each state.

DRAKE DE KAY.

SALVADOR, săl'vȧ-dôr (formerly SÃO SALVADOR or BAHIA), city, Brazil, capital of the State of Bahia, is on the Atlantic and All Saints Bay 750 miles northeast of Rio de Janeiro. A seaport and Brazil's fourth largest city in size, Salvador has an airport, railway connections with the interior, and a well protected deepwater harbor. The chief industries are sugar refining, cacao processing, and the manufacture of tobacco, cotton textiles, furniture, and footwear. Besides these products it exports hides, carnauba wax, and industrial diamonds. Petroleum and natural gas have been found in the northern suburbs. Salvador is built on two levels connected by public elevators and graded roads. The lower level is the commercial center. In the upper town are parks, public buildings, hotels, shops, and a university with schools of law, medicine, engineering, and fine arts. Founded in 1549 as São Salvador by Tomé de Souza, first governor general of Brazil, the city was the capital of the country until 1763. Pop. (1950) 395,993.

SALVADOR, El. See EL SALVADOR.

SALVAGE, săl'vĭj, the act of saving a ship or cargo from extraordinary danger, as from fire, the sea, an enemy, or pirates. In commercial and maritime law: (1) a payment or compensation to which those persons are entitled who have by their voluntary efforts saved ships or goods from extraordinary peril. The amount of salvage to be paid is generally agreed on between the salvors and the owners of the property salved; but if they cannot agree, the sum to be paid, and the proportions in which it shall be paid, are determined by the Admiralty Court. The crew of a ship are not entitled to any salvage for any extraordinary efforts they may make in saving their own vessel. (2) The property saved from extraordinary danger by the voluntary efforts of the salvors. See also INSURANCE PATROLS; MARITIME LAW.

SALVARSAN AND NEOSALVARSAN. The term salvarsan is used commercially as the equivalent of dioxydiamido arsenobenzol, the formula for which is $C_{12}H_{12}O_2N_2As_2$. It is popularly known as 606 because its originators Ehrlich and Hata made that number of experiments and combinations with arsenical preparations before arriving at salvarsan. Its discovery was announced in the early part of 1911. It is also known as the Ehrlich-Hata preparation. The active element in this combination as indicated in the formula is arsenic of the tervalent form, the quinquevalent form being much less potent as a spirochaetocide. The aim and the hope of Ehrlich in his long series of patient efforts was to find a substance which in a single dose at a single blow should overpower syphilis (q.v.), a goal which he termed therapia magna sterilisans. A very ambitious project, almost an impossibility, and yet he barely missed it.

In the experimental work in which apes had been successfully syphilized with cultures of *Spirochaeta pallida*, contrary to the belief that animals could be inoculated with syphilis, Ehrlich's dream had been partially realized. Apes, including chimpanzees, had been sterilized, that is, they had been cured of experimental syphilis with a single dose of salvarsan, but in human beings this cannot be done. Still salvarsan is one of the greatest of human achievements in the field of therapeutics.

Remarkable results, not cures, have been obtained and may still be obtained with a single dose of salvarsan, especially if the disease is treated in the very early stage; but to produce such a profound effect as is implied in the *cure* of syphilis would require a larger dose than could be tolerated by a human being; it would produce a poisonous and probably a fatal result.

Salvarsan is prepared as follows: Sodium amalgam (28.8 grams of 4 per cent sodium) is added to 30 cubic centimeters of water and 32 cubic centimeters of 2*N*-acetic acid containing 4.98 grams of 3-amino-4-hydroxyphenylarsenious oxide. A yellow precipitate is produced. When the amalgam has been used up there is added 25 cubic centimeters of 2*N*-acetic acid and 28.8 grams more of the sodium amalgam. This procedure is once more repeated, when the reduction will be complete. The precipitate is then dissolved in 60 cubic centimeters of methyl-alcohol, and the calculated amount of methyl-alcoholic hydrochloric acid is added. The salvarsan hydrochloride is then precipitated by adding ether after filtering.

Commercial salvarsan is a pale yellow, bulky, micro-crystalline powder which is permanent when dry, but highly oxidized in air, and decomposes in aqueous solutions, and especially in those which are alkaline, even in the absence of air. It dissolves readily in water, methyl-alcohol, ethylene-glycol, and glycerol, and sparingly in ether and acetone. It has an alkaline

reaction. As found on the market it is generally mixed with impurities, and is quite variable as to its content of arsenic. For therapeutical use it must be dissolved in distilled, *not in boiled water,* for it has been found, or at any rate supposed that the albumen from the organisms in the water which has been boiled for the solution would vitiate the action of salvarsan when introduced into the body. Unlike mercury it may not be taken by the mouth nor rubbed into the skin by means of an ointment. It is used entirely by injection, three methods being possible, the subcutaneous, the intramuscular and the intravenous. The subcutaneous method has been practically abandoned for the substance remains within the tissues as an infiltrate, without producing any appreciable effect upon the spirochetes which are the cause of the disease. In fact it becomes a distinct source of harm, and cases have repeatedly been reported in which it has resulted in abscess and extensive neurosis of tissue.

Intramuscular injections have been approved by some physicians and discarded by others. The large muscles of the gluteal region are usually selected for this purpose and the injection into them is made deeply. The objections to this method are the intense and persistent pains which follow the injections and the continuance for a prolonged period of the infiltrations. These infiltrations do not terminate in suppuration but the salvarsan may become disintegrated and cause arsenical poisoning.

The form of injection which now receives the approval of the majority of experienced syphilographers is the intravenous.

The veins at the bend of the elbow are selected for the injection, the skin being first carefully sterilized. A tourniquet is secured around the arm and the injection is made into either of the veins which are thereby distended. After the operation of injection has been accomplished the wounded vein must be carefully dressed, this precaution being an important one.

It is also very important that the injection should not be made as a matter of office routine, but in the patient's house, or in a hospital where all necessary appliances are at hand. The patient should remain in bed from 24 to 48 hours after he has received the injection. The reaction which may be expected from an intravenous injection of salvarsan usually consists of slight elevation of temperature, chill, fever, headache and vomiting.

The quantity af salvarsan which should be used in an injection is from 0.4 to 0.6 gram. Death has been attributed to arsenical poisoning in some of the fatal cases, as large a quantity as three or more grains of arsenic having been liberated into the body by the disintegration of the injected salvarsan.

It is quite apparent that the danger which attends the intravenous method is much greater than that which attends the intramuscular. Contra-indications to the use of salvarsan are heart disease in various forms, including aneurism and dilatation, myocarditis and uncompensated valvular disease. It should not be used in cases of advanced nephritis, nor in those cases of tertiary syphilis in which the cerebral and meningeal symptoms are threatening, in arterio-sclerosis nor in the presence of high fever. Blindness and deafness have occurred after the injection of salvarsan but they have usually cleared up after a suitable course of treatment with mercury. It is now believed that syphilis cannot be cured with salvarsan alone but that it should be used in conjunction with mercury, except possibly in primary syphilis. "Sodium salvarsan," prepared by precipitating with alcohol a solution of salvarsan in aqueous sodium hydroxide in the presence of a stabilizer (such as sodium hydrosulphite, mannitol or other polyhydric alcohols), has proved satisfactory in the ambulatory treatment of syphilis. "Copper salvarsan," prepared by adding sodium hydroxide to a solution of salvarsan and a copper salt, has been found useful in the treatment of "sleeping sickness."

Neosalvarsan or **Novarsenobenzol.**— The untoward results which attended the use of salvarsan induced Ehrlich to continue his experiments in the hope of discovering a substance by which they might be obviated. In October 1911 he introduced Neosalvarsan or "Ehrlich 914" (the number indicating the total in the series of his experiments, from the beginning), a condensation product of formaldehyde, sulphoxylate of sodium and salvarsan. Its distinct advantage over salvarsan is that it is neutral in reaction, salvarsan being alkaline.

It is a dry powder which is readily soluble in water or preferably in a dilute solution of sodium chloride.

It is used by injection either intramuscularly or intravenously, and will not cause infiltrations like salvarsan, nor will it cause necrosis of the veins into which it is injected, nor will it produce the severe pain which is caused by salvarsan. Because of its neutral reaction it will modify or abolish certain distressing symptoms which have frequently followed the use of salvarsan including vaso-motor disturbances and congestions which have sometimes resulted in collapse, œdema of the face, diarrhœa, colic, etc. Larger doses of this substance may be used than of salvarsan of which it contains 66 per cent. It is always safer, however, to begin the treatment with a small dose, especially in women, and increase them as the indications may warrant. Thus the limits of dosage may be placed between 0.3 and 1.5 gram. The contra-indications are the same as for salvarsan.

A pronounced advance in the treatment of syphilis and kindred disorders has been made possible by the development of two other neosalvarsans, known as "Galyl" and "Ludyl," respectively, "No. 1116" and "No. 1151" of Mouneyrat's series. The first is an acidic substance dissolving in aqueous sodium carbonate to a neutral solution, and as such, very suitable for intravenous injection in the treatment of syphilis and other protozoal diseases. Ludyl is prepared by the Schotten-Baumann reaction from benzene-*m*-disulphonic chloride of salvarsan. Both galyl and ludyl, as used in the treatment of syphilis, have a very energetic spirillicidal action, while being but feebly toxic and well tolerated in the system. There is no apparent congestive action of the organs of the body following their use, and no secondary ill effect on the nervous system; while their action upon the blood and general nutrition is favorable.

Under the use of these substances, especially

when combined with mercury, the symptoms of syphilis rapidly improve, and the Wassermann test, which should be repeated every month or two, will indicate the progressive destruction and disappearance of the spirochetes.

There is no definite time limit within which salvarsan or neosalvarsan, in connection with mercury, should be used; it may be a year; it may be much longer. A persistent negative Wassermann reaction indicates the disappearance of the cause of the disease, but just when this limit will be reached it will be impossible to predict in any given case.

SALVATIERRA, säl-vä-tyĕr'rä, Mexico, city in the State of Guanajuato, on the Rio Lerma, and the Celayo-Acambaro railroads, 50 miles southwest of Queretaro. The chief industry is cotton-spinning. Pop. (1940) 8,341.

SALVATION ARMY. William Booth (q.v.), born in 1829 at Nottingham, England, was "converted" in 1844, ordained minister of the Methodist New Connexion in 1852, married Catherine Mumford in 1855 and seceded from the Wesleyans in 1862 in order to devote his whole energy to aggressive evangelism, especially among the poor who in large numbers had "lapsed" from the churches. In 1865, he raised a tent over a disused Quaker burial ground, so starting what came to be called the Christian Mission over which he presided as general superintendent. In 1878 the name of the mission was changed to Salvation Army and William Booth assumed the title of general, with autocratic powers, his wife being known as "the Mother of the Army." Trained workers on full time were commissioned as officers with assigned ranks, appropriate uniforms, orders and regulations to be obeyed and military discipline like "knee drill" or prayer. In "citadels" there was arranged the "penitent form" where multitudes of people of all classes in society, some of them victims of drink, vice, gambling and other evils, others quite respectable though lacking in spiritual satisfaction, confessed their sins and were reclaimed, marching henceforth under the "Blood and Fire" flag—Blood for atonement by Christ on the Cross, and Fire for the Pentecostal gift of the Holy Spirit. Unlike the contemporary revival led by Dwight L. Moody of Chicago, the Salvationist movement was from the first consolidated into a permanent organization, sometimes described as a religious order within the Protestant fellowship, but with this difference, that Salvationists, rejecting celibacy, married, every wife holding the same rank as her husband. At first, there was violent opposition to the processions, the music of brass bands, the street meetings, the ejaculations and the fearless witness of the army, the whole of which was dismissed by Thomas Henry Huxley with contempt as "corybantic Christianity." But far-sighted laymen like Earl Cairns, the lord chancellor, the earl of Shaftesbury, the conscience of his country, and John Bright, the Quaker statesman, recognized that here was an answer to deep-seated social needs with which the churches were not adequately dealing, and inquiries by Parliament, official and unofficial, allayed hasty criticism and established a confidence in the Salvation Army which, despite difficulties, is today wide as the world.

Control of the army and its properties was vested in the founder, William Booth, all of whose eight children, according to capacity, helped him. In 1890, Catherine Booth died and later three of the Booths drifted from the Flag. In 1896 Ballington founded the Volunteers of America. In 1902, Catherine (daughter) followed her husband, Arthur Sydney Clibborn into the "Zionist" camp of Dr. Alexander Dowie, and in that year Herbert Booth took up independent preaching. On the founder's death in 1912, William Bramwell Booth, his eldest son and chief of staff, became second general with power to name his successor. But in 1929 a High Council of Commissioners and Territorial Commanders selected Edward J. Higgins to be third general, and he was followed by Evangeline Booth, George Carpenter, and Albert Osborn. The strong guidance of the Booths was thus terminated but their achievement continued with undiminished momentum.

From 1880 onwards, the army spread overseas as an international crusade. The most remarkable expansion was in the United States where, under Evangeline Booth, the equipment of the army, valued at $1,500,000 in 1904, increased during thirty years to approximately $35,000,000. During disasters like the earthquakes in San Francisco and Japan and the explosion in Texas City (1947) the army has repeatedly rendered first aid, and in France, during World War I, the army won outspoken appreciation for its service among troops—a record fully sustained during World War II. In India the army has been among agencies caring for lepers, and at the request of the government it has handled criminal tribes with encouraging results. In 1947, the French government invited the army to supervise the clearance of Devil's Island in Guiana, including the repatriation of time-worn convicts.

The army's statistics are subject to disturbed conditions in the world. In 1949 the recorded number of officers and cadets was 28,000, and 15,500 other persons without rank were wholly employed. This large force conducts 18,000 corps and outposts, 1,800 social institutions and agencies, 1,000 day schools and 101 periodicals, including the *War Cry,* with a total circulation of 2,500,000. Salvation is preached to more than 100 countries and communities, addressed in more than a hundred languages. The work of the army in prisons, rescue and maternity homes, crèches, labor bureaus and many other fields is thus of recognized social significance. But within the personnel of the organization there is a never-flagging insistence on those definitely spiritual powers and impulses which from the first have animated the Salvationist as an envoy of the Gospel.

SALVATOR, a name for the monitor lizard; also applied to the South American teju (q.v.).

SALVE REGINA, săl'vē rē-jī'nä, the first words of a prayer addressed to the Mother of Christ, in Roman Catholic religious services.

SALVIA, a large genus of the Labiatae, occurring in temperate or warm regions, sev-

eral living in the southwestern United States. They range in size from herbs to shrubs, in foliage from entire to pinnatifid leaves and in inflorescence, from axillary to panicled. The flowers are sometimes two inches long and of nearly every hue except yellow; and the floral leaves are often changed into colored bracts, adding to their brilliance. The genus is remarkable for the arrangements made for cross-fertilization. The blossoms have a two-lipped corolla, two rudiments of stamens and two polliniferous stamens. The latter stand at the entrance to the throat of the flower, have short immovable filaments and a very long connective between the two anther cells of which the lower is abortive. This connective is crescent-shaped, the horns pointing outward and rocks upon the filament in such a manner that a bee entering the blossom pushes back the lower arm and brings down the other on its back, so that the pollen-filled anther cell deposits part of its contents there.

Salvia officinalis, the common sage (q.v.) and many others are cultivated either for savory herbs or for their flowers; or, as in the Clarys (*S. selarea*), for colored bracts; or, as in *S. argentea,* for its wholly white foliage.

SALVINI, säl-vē'nē, **Tommaso,** Italian tragedian: b. Milan, 1 Jan. 1829; d. 1 Jan. 1916. He began his studies at Florence but showing a talent for acting, his father, who was an actor, put him under the instruction of Gustavo Modena and at 16 he entered upon his stage career. In 1849 he left the stage to take part in the war of Italian independence, was made a corporal and served throughout the siege of Rome. He returned to the stage the following year and acted in the company with Adelaide Ristori. He soon began the study of those parts that he later played with such success, Orosmane in 'Zaïre,' 'Oreste,' the 'Saul' of Alfieri and Shakespeare's 'Hamlet' and 'Othello.' His success in Italy was such as to warrant him in looking abroad for honors and he next appeared at Paris where the critics were equally enthusiastic in his praise. In 1865 he took part at Florence in the celebration of the 600th anniversary of the birth of Dante, reciting passages from the 'Divine Comedy.' He played in various cities of Spain and in 1871 went to South America to play at Montevideo, Buenos Aires and Rio de Janeiro. In 1873 he appeared for the first time in the United States, enacting Othello at the Academy of Music, New York, 16 September. In 1875 he appeared in London. He afterward played in many parts of Europe and again in America in 1880, his supporting company being American actors, speaking English while he spoke Italian. He made five visits in all to the United States; in one of these (1886) playing Othello to Edwin Booth's Iago and the Ghost to the other's Hamlet. He retired from the stage in 1891. Besides parts already mentioned he appeared with distinction in the Egisto of Alfieri's 'Merope'; Palo in 'Francesca da Rimini'; Œdipus in a play of that name written for him by Nicolini; Conrad in 'La Morte Civile'; in 'Sampson, the Gladiator,' 'Macbeth,' 'King Lear,' 'Coriolanus,' and finally in 1891 at Florence as Iago. Consult Winter, William, 'Shadows of the Stage' (New York 1892); id., 'The Wallet of Time' (ib., 1913); 'Leaves from the Autobiography of Tommaso Salvini' (London and New York 1893).

SALVINIA, a genus of an aquatic family (*Salviniaceæ*) of cryptogams. They are floating plants, widely distributed in warm regions and not far removed from the ferns. *S. natans,* common in southern Europe and tropical America, has a sparingly branched stem lying on the water and develops three leaves at each node; two of these float as oval, green, and papillose foliage, hairy underneath, while the submerged third is divided into numerous hairy filaments, hanging like tassels in the water and metamorphosed into absorptive organs, that appear to be true roots, but are not. The spherical sporocarps, or sori, are borne near the junction of these filaments with the stem and are generally in groups of three, each enclosed in a cuplike growth from the filament, like the indusium of a fern and enclosing unisexual sporangia. The sporangia are composed of either microspores or macrospores. The microspores form antheridia and liberate spermatozoids which fertilize the archegonia developed by the macrospores. Several species of the *Salviniaceæ* are useful in aquaria.

SALWIN, säl'wēn, **SALWEEN,** or **SALUEN,** Burma, the most important river of the country. It has its source in the Tanla Mountains, south of the Kuen Lun, drawing also from the Kara Nor, some of its water. At its source, it is known as Nagtschu, and consists of the united volume of water coming from the glaciers of the mountain streams rising on the Tibetan plateaus. Its name among the Chinese is Lu-Tse-Kiang. The Burmese call it Thanlwin. About 160 Kilometers from its mouth appear many dangerous rapids, a great menace to navigation. The current is variable. It is a wild and picturesque stream, whose aspect varies greatly in the dry and wet seasons. After the rains the water washes high up the slopes against the trees of the forests; the average difference between high and low water amounting to from 50 to 90 feet. In the lower part of its course, islands also obstruct navigation (not visible at high water). The worst part is the gorge between the Yônzalin and Kyankhnyat rivers. Many ferries are used to cross the river and at these points villages are built on the heights above. There are a few bridges in Chinese territory. The Salwin's chief tributaries are the Nam Yu, Nam Oi, Hsipa Haw, Nam Nim, Nam Ting, Nam Kyek, Nam Nang, Nam Koa, Nam Hka and Nam Pang — its largest tributary,— the Nam Hsim, Mē Sili and Mē Sala; the Nam Hang, Nam Pan, Nam Teng, Nam Pawn, the Thaung-yin and the Yônzalin. The Salwin cuts the British Shan states almost in two. Kyodam, the great timber depot, lies 30 miles below the junction of the Thaung-yin and the Salwin. A cable stretched across the river at this point catches all the timber (teak), which is made into rafts and floated down to Kado near Maulmein (where the revenue is collected). From Kyodan southward and as far as Shwegôn, 63 miles from Maulmein, boats and steamers of light draft can safely navigate. The area of the Salwin Basin is 62,700 square miles. Its length 800 miles, breadth from one to four miles.

SALZA, zält'sä, **Hermann von,** grand master of the Teutonic Order: b. Germany, about 1170; d. Barletta, Italy, March 19, 1239. Appointed grand master about 1210, he became councilor to Frederick II, Holy Roman emperor, whom he accompanied in the attack upon the Saracens at Damietta, Egypt, in 1221; he was also with the emperor on the Fifth Crusade, in 1228–1229. In 1230 he was instrumental in effecting a reconciliation between the sovereign and Pope Gregory IX; and in 1235 he persuaded Henry, elder son of Frederick, to abandon the revolt which he had incited against his father's authority. Powerfully supported by pope and emperor alike, Salza was enabled to raise his order to the height of its power, with all privileges enjoyed by older orders and with great territories extending to the eastern frontier of Germany.

SALZBRUNN, zälts'brŏŏn, Poland, a group of three villages in Lower Silesia (Schlesien), 30 miles southwest of Wroclaw (Breslau). Since the 14th century Salzbrunn has been known as a watering place, the alkalo-saline waters of its eight mineral springs being especially adapted to pulmonary complaints; thousands of people visit the springs each year, and bottled waters are also exported. There are coal mines in the district; and industrial works which include glass and porcelain factories, wire-making plants, and wool looms. Salzbrunn had lain within Germany until 1945, when extension of the Polish frontier westward had been sanctioned by the United States, Russia, and Great Britain pending the signing of the World War II peace treaty. Pop. 13,761.

SALZBURG, zälts'bŏŏrk, Austria, (1) capital of the province of that name, occupies a position of singular beauty on the Salzbach, 87 miles southeast of Munich. It lies in a valley from which tower the wooded slopes of the Salzburg Alps. The steep sides of the Mönchsberg rise from the midst of the town, rocky and rugged. In the ancient cemetery of Saint Peter, the vaults are hewn in rocky clefts. Many of the private and public buildings are handsome marble structures and are suggestive of the Italian. Shady promenades skirt the winding river. The cathedral is a fine specimen of Renaissance architecture, built in 1614–1628 in imitation of Saint Peter's. A monument to Mozart, who was born here, stands in Mozart Platz. The present palace of the archbishops is an imposing edifice, opposite to which are the government offices and law courts. Across the river is the Mirabell palace, once the summer residence of the prince-archbishops. There are 24 churches, a theological seminary, fine libraries, and a museum. Salzburg is a very popular summer resort, which contributes much to its development and progress. A park, theatre, art gallery, and baths are among striking improvements. There are numerous benevolent and charitable institutions. Salzburg engages in a variety of small manufactures, such as musical instruments, marble ornaments, ironwares, cement, and artificial wool. Its trade is improving. Its origin and development were equally ecclesiastical, its archbishops German princes. The monastery and bishopric founded here (500–700) by Saint Rupert of Worms, was the nucleus of the present town. It has been the scene of several religious conflicts and is distinctively Catholic. Pop. 77,523. (2) The province covers an area of 2,762 square miles. It is characteristically mountainous with longitudinal valleys intersecting the hills. Of the 200 lakes, Lake Zell is celebrated for its wondrous mountain panorama. It has many mineral and thermal springs and valuable mines and forests. Pop. 267,169.

SALZKAMMERGUT, zälts'käm-ĕr-gōōt, Austria, an Alpine district, some 230 square miles in area, partly in Styria and partly in the provinces of Lower Austria and Salzburg. Because of its magnificent lakes and mountainous scenery it has been termed the "Austrian Switzerland." The lakes include Atter, Traunsee, Hallstätt, and St. Wolfgang; Dachstein, 9,830 feet in height, is the highest peak. The principal resort town of the Salzkammergut is Ischl. The district derives its name (in German meaning property of the salt administration) from the extensive deposits of salt.

SALZMANN, zälts'män, **Christian Gotthilf,** German Protestant clergyman and educator: b. Sommerda, Thuringia, June 1, 1744; d. Schnepfenthal, Oct. 31, 1811. Educated at Jena, from 1768 till 1781 he served as pastor, and for the next three years he taught morals and religion at the Philanthropinum in Dessau. A believer in natural religion, in 1784 he established at Schnepfenthal a school organized on especially broad principles. Salzmann, who held the theory that isolation was a requisite of moral education, was a determined opponent of many methods of teaching then in force, contending that the faults of the pupil should justly be credited to the teacher. His school, which attained a considerable reputation, was continued after his death. His writings on educational matters were extensive, most of them being in the form of fiction or of satire upon prevalent practice in instruction. Among his works were *Krebsbüchlein* (1780); *Karl von Karlsberg* (1780–1786); *Konrad Kiefer* (1794); *Ameisenbüchlein* (1806). His collected works were published in 12 volumes at Stuttgart in 1845–1846. Subsequent editions of his collected works include those of Wagner in *Klassiker der Pädagogik* (1900) and Ackerman in *Bibliothek pädagogische Klassiker* (1897–1901). His school published a *Memoir* of him in 1884.

SAM HOP TONG, a Chinese secret fraternity. According to tradition, it has existed since the establishment of the Chinese nation. Its history can be traced back to the 17th century when, as a patriotic organization, it helped to overthrow the Ming dynasty. Subsequently its character changed, the society becoming an association of men banded together solely for purposes of murder, robbery, and blackmail. With migration of Chinese to the west coast of the United States in the 19th century the Sam Hops, known as the Chee Kung Tong in California, engaged in many criminal activities. The movement was brought to light in San Francisco in 1891, but little success in checking it was achieved until 1898, when Chinese business men appealed to their home government for assistance. As a result, hundreds of arrests were made and within a short time the society virtually ceased to exist.

SAMAL, sä'mäl, an island of the Philippines in the northern part of Davao Bay forming the east shore of Pasiputan Strait, length 17

miles, width 13 miles, area 140 square miles. Its general elevation is 820 feet, some parts of the shores are low and wooded and other portions are high and rocky. The soil is fertile, and chocolate is the chief product; excellent timber is also obtained. The island is administratively part of the province of Davao.

SAMALES, sä-mä'lēz, a small tribe of the Philippine Islands, living on the Samales Group, at the northeast end of the Sulu Archipelago. They are of the Malay race.

SAMANA, sä-mä-nä', BAY, Hispaniola, an indentation of the eastern coast of the Dominican Republic, 30 miles long and 10 miles wide. It affords an excellent anchorage, being well sheltered and deep. On the north side of the bay is the town of Samana (pop. 1,638), capital of the province of Samana (pop. 31,243). Cacao, bananas, and coconuts are shipped through the port of Samana. Because of its strategic position between the United States and the Isthmus of Panama, in 1870 the American government negotiated a treaty for the purchase of Samana Bay, but the transaction was not completed on account of the United States Senate's refusal to ratify.

SAMANID, sä-män'ĭd, a native dynasty of Persia (Iran) of the 9th and 10th centuries. It was founded in 874 by Nasir I, great-grandson of Saman, a Persian noble of Balkh who was converted from Zoroastrianism to Islam, and for whom the line was named. The capital was at Bokhara. Persian literature and art were greatly aided by the successive Samanid rulers. The dynasty came to an end in 999, when Abdalmalik II was overthrown by the Ghaznevids.

SAMAR, sä'mär, an island of the Philippines, the third in size of the archipelago. It lies southeast of Luzon, in the extreme northeastern part of the Visayan group and east of Leyte, from which it is separated by the narrow Strait of San Juanico; length northwest and southeast 156 miles; width 75 miles; area 5,198 square miles, with dependent islands 5,488 square miles. A central mountain chain traverses the island from northwest to southeast, being divided near the center by the valley of the Ulut River; there is also a group of mountains in the extreme northwest. Their height rarely exceeds 1,700 to 1,800 feet. The island has a number of rivers, of which the largest and most important are the Oras and Ulut on the east, the Bató on the north, and the Gándara on the west, and there are four lakes. Among the natural curiosities is an arch over the Basey River formed by two limestone rocks from 34 to 40 feet high. In the rocks on the left a cave opens 37 feet above the water, which is 94 feet deep; it has been partially destroyed by the caving of the rocks overhead. The place is known as the *Cuevas de Sojotón.* The soil of the island is fertile, being adapted to the production of all the staples of the Philippines. The most important products are hemp, sugar, rice, and coconuts; coffee, cacao, tobacco, and wheat are also cultivated in abundance. A number of medicinal plants grow on the island, the most famous being the one producing the seed called "isigud," or the "fruit of San Ignacio," also known as "Catbalogan seed," because large quantities of it are grown near the town of Catbalogan. This is highly prized by the Chinese as an efficacious remedy for cholera. Valuable timber is found; bamboo and rattan are abundant, and wax and honey are obtained in large quantities. Coal, gold, and copper are found in the mountains. The raising of horses, cattle, hogs, and goats is an important industry. Sugar and cocoanut-oil are manufactured, and there are other manufactures for domestic use. Though there are few roads in the island there is good communication with the interior by means of the rivers, which are navigable for native boats. There is also an extensive coastwise trade, and trade with Manila. The people of Sámar are of Visayan blood, representing most fully the characteristics of the Malay race. In the mountains of the interior there are a few thousand primitive people who have not yet been brought under civilizing influences. The island of Sámar, with its adjacent islands, was constituted a province and placed under civil government in 1902. The population of the island numbers 470,678; and that of the province, 546,306.

SAMARA, former name of Kuibyshev (q.v.).

SAMARANG. See SEMARANG.

SAMARIA, sà-mâr'ĭ-à, Palestine, (1) the ancient capital of Samaria, 36 miles northwest of Jerusalem, occupied the acclivity of an isolated and abrupt height—Mount Sameron, which is separated from the surrounding mountains by a rich and well-watered plain. The town rose in terraces from this plain to a height of 400 or 500 feet. Samaria was the capital of Northern Israel from the date of its foundation by Omri, about 925 B.C., to the time of its capitulation to the Assyrians 721 B.C. The site was selected by Omri for a stronghold and capital, as commanding two of the most important highroads. The situation surpasses greatly that of Jerusalem, though not so picturesque. It commands, however, a charming view toward the Mediterranean, the mountains of Schechem, and Mount Hermon. The most important ruins are those of the time of Herod. It was in Samaria that the 10 tribes of Israel founded their independent state after the revolt, perpetuating their mutual animosity by incessant warfare. Thus the name Samaritan became a term of bitter reproach. This antipathy was religious as well as political, but was later mitigated by the return of the Samaritans to the ancient form of worship, and by the erection of a temple, modeled after that of Solomon in Jerusalem, soon after Alexander the Great had passed through Syria. Samaria having been presented by Augustus to Herod, he rebuilt the city, which had been the residence of all the kings of Israel till its overthrow by the Assyrians—calling the new temple Sebaste, in honor of the donor. An old church or mosque, once dedicated to John the Baptist, in the adjacent village of Sebastieh, marks the scene of that saint's burial or martyrdom. In World War I the city was in the zone of military operations by the British against the Turks, resulting in the surrender of Jerusalem, Dec. 10, 1917; it had been in possession of the Mohammedans, with two brief intervals, for more than 1,200 years. (2) Samaria, the name also given to the kingdom of Israel and the subsequent Roman province forming the central portion of Palestine; it stretched southward from the Plain of Esdraelon, declining south of Hebron into the desert plateau of Et Tih.

SAMARITAN LANGUAGE AND LITERATURE, the tongue and literary productions belonging to the inhabitants of Samaria, a region in Central Palestine of indefinite boundaries, possessing a capital of the same name.

Samaritan Language.— The Samaritan language was formed of varied elements gradually collected and assimilated from the Hebrew, Chaldee and Syriac. Greek, Latin, Persian and Arabic also contributed words to this dialect which grew up among a people isolated and even secluded in some respects, but through whose territory passed the immemorial trade route which connected Egypt and Africa with Assyria and the far East. Thus roots and heterogeneous scraps of language were jumbled together in the vernacular of an illiterate people, whose grammar was irregular, whose orthography was uncertain; there appears a complete confusion between the gutturals and cognate letters severally; quiescents or silent vowels prevail, and while vowel sounds are uncertain that of a is the most prominent. When the Arabians conquered Palestine in the 7th century this language gave place to that of the conquerors excepting among the priests, where it survived as the language of religion and ritual; thus it shared the fate of Hebrew among the Jews, Latin in Italy and the Roman provinces and Sanskrit in Hindustan. Like all Semitic languages it is read from right to left and the alphabet consists only of consonants, namely, alaf, bith, gaman, dalat, i, ba, sen, it, tit, jud, kaph, labad, mim, nun, simcat, in, phi, sadi, goph, rish, shan, tav. The two vowels with which certain words begin have a slight consonantal value. There are no accents or other diacritical symbols and no vowel points as in other Semitic languages, but some consonants are used as vowels. The numbers are written as in Hebrew. The characters appear in two forms, one of which is found in manuscripts, the other being confined to engraved inscriptions.

Samaritan Literature.— The literature of the Samaritan people consists of many departments, including grammar and lexicography. Three grammatical treatises on the Samaritan language were published from a manuscript at Amsterdam in 1862. They expound the theories of certain Arabian grammarians, from whose philological works whole passages are copied word for word. The Samaritan pronunciation may be judged of by the transliteration of Hebrew words into Arabic. No Samaritan lexicon has yet come to light. The lexicography, therefore, of the language is in an inchoate condition. The nearest approach to a glossary is to be found in the fragments of 'Tardeschemans' (interpreters) Hebrew-Arabic dictionaries now preserved in the Library at Leningrad. There are also at Paris in the Bibliothéque Nationale des Anciens Fonds a concordance of forms occurring in the Scriptures with the Arabic and Samaritan words in parallel columns. The Imperial Library at Saint Petersburg also possesses some Samaritan calendars, or astronomical tables. In legendary lore are several extant manuscripts. The British Museum possesses a 'Commentary on the Legends ascribed to Moses,' which is largely a compilation from Jewish sources. Of a similar character is the 'Jewelled Necklace in Praise of the Lord of the Human Race,' that is, Moses, who is credited with a divine nature, while great emphasis is laid upon the circumstances of his birth and the miracles he wrought. These two are typical of a somewhat extensive Samaritan legendary literature. The Samaritan commentaries on the Pentateuch are many in number and interesting as showing the doctrines of these people. It abounds in quotations from the Pentateuch, the prophets and the Mishna, and avoids all references to the Deity which imply an anthropomorphic conception. A number of fragments from the commentaries are also preserved at Saint Petersburg. The Samaritan 'Chronicle or Book of Joshua,' sent to Scaliger by the Samaritans of Cairo in 1584, seems to have revised and redacted into its present form about 1300 A.D. from four special manuscripts, three Arabic and one Hebrew, that is Samaritan. Among other things it relates that "King Joshua" waged war with 300,000 mounted men against two kings of Persia, and was succeeded on his throne by five "royal" rulers — the last being Sampson. The 'Chronicle of Abulfath' covers a period from Adam to Mohammed and is full of the wildest fables. Consult Uhlemann, 'Institutiones linguæ Samaritanæ' (Leipzig 1837); Petermann, H., 'Brevis Linguæ Samaritanæ Grammatica' (Berlin 1873); Gesenius, W., 'De Pentateuchi Samaritanæ indole' (Halle 1815); Brüll, A., 'Kritische Studien über Samaritanische Fragments in Oxford (Frankfort 1875); Kohn, S., 'Zur Sprache, Litteratur und Dogmatik der Samaritaner' (Leipzig 1876); id., 'Samaritanische Studien' (Breslau 1868); Cowley, 'The Samaritan Liturgy' (Oxford 1909).

SAMARITAN PENTATEUCH, an ancient version of the books of Moses, which has been preserved by the Samaritans, and along with the book of Joshua, constitutes their sacred scriptures. The Samaritan Pentateuch is most probably a recension of the same original as that from which the Jewish came, and possesses an independent value in determining the text. It is written in a non-Hebrew character, probably older than that of the Hebrew Septuagint. A manuscript copy of the Samaritan Pentateuch is in existence which is said by the Samaritans to have been written by Abishua, the great-grandson of Aaron. There are various other manuscript copies of this version, besides a translation of it in the Samaritan vernacular and one in Arabic, which after the 7th century superseded Samaritan as the language of the people. The work was known only through Origen, Jerome and other early writers until Pietro della Valle discovered a copy of it at Damascus in the 17th century. There are now several printed editions. See SAMARITAN LANGUAGE AND LITERATURE.

SAMARITANS, so called from the city of Samaria, the capital of the kingdom of Israel, and from Samaritis, the region adjoining that city. The policy of the Israelitish kings was, as a rule, to keep their subjects apart from too close association with the kingdom of Judah, and the breach between the two peoples was made wider, when, after the captivity of Israel, Assyrian colonists intermarried with the remnant left behind by the conquerors, and the

Samaritans ceased to be of purely Hebrew descent. The New Testament shows the aversion with which they were regarded by the Jews in the time of Christ, and even to this day when the Samaritans are represented by a few families still worshipping at Mount Gerizim, the dislike with which the Jews look upon them is as strong as ever. The Samaritans claim to be purely Mosaic in their creed, and that the Jews have departed from the ancient teachings of Israel. They worship one God, practise circumcision and the purifications, and keep the feasts, except the Purim and the feast of the Dedication. They look for a Messiah and believe in a resurrection from the dead and retribution in a future life for wrongs done in the present one. They marry among themselves only and practise polygamy in a limited degree. See also JEWS AND JUDAISM; JEWISH SECTS.

SAMARKAND, säm-ar-känd' (ancient, MARCANDA), Uzbek Socialist Soviet Repub., chief town of the former province of that name, and formerly capital of Sogdiana, in a fertile valley, 130 miles east of the city of Bokhara. The citadel stands at the west and beyond is the newly-built town. The Righistan, or main square, is of unrivaled beauty in its architectural features. The principal buildings are a palace, the bazaars, the Ulg-beg *madrasa,* or college; the tombs of Timur and his wives; two other colleges of the 17th century—splendid buildings, highly decorated with arabesques, enameled tiles of various colors, rich marble, and inscriptions of gold, etc., and 250 mosques. There is a brisk trade, and the chief items of commerce are cotton, silk, wheat, rice, horses, asses, fruit and cutlery. Gardening is the principal occupation, and there is some manufacturing. Wheat, rice and silk are exported, chiefly to Bokhara; silkwares, fine fruits, and rock-salt are imported. Samarkand has been for more than two centuries a great Asiatic mart. As Marcanda, it was taken by Alexander the Great. It had a checkered history; taken in 712 by the Arabs, it finally fell into possession of the Russians in 1868. In 1925 the province of which Samarkand was the capital was included in the Republic of Uzbekistan, created in that year as one of the constituent states of the Soviet Republic out of the republics of Bokhara and Khiva. Pop. of city 154,600; Republic (1933) 5,044,300.

SAMARSKITE, a rare and exceedingly complex, velvet black, nearly opaque mineral, occurring mostly massive, rarely in crystals. It is distinguished by its dark reddish-brown streak, splendent, vitreous to resinous lustre and conchoidal fracture. Its hardness is 5 to 6, specific gravity 5.6 to 5.8. Its usually rough crystals are rectangular prisms of orthorombic symmetry. It is a niobate (and tantalate) of iron uranium, and the cerium and yttrium metals. It is chiefly remarkable for the large number of rare metals which it contains, including samarium, terbium, gadolinium, and the doubtful mosandrum, decipium and phillipium. Its only European locality is Miask, Russia, but it is found sparingly in Canada, also in the United States in Connecticut, Maryland and Colorado. The only localities of commercial importance are in North Carolina.

SAMBOURNE, săm'born, **Edward Linley,** English cartoonist: b. London, 4 Jan. 1845; d. 3 Aug. 1910. He was educated at the City of London School and Chester College, and at 16 became an engineering draughtsman. In 1867 Mark Lemon, editor of *Punch,* accepted a small drawing from his hand, and he soon formed the connection that lasted through life. In 1871 he was given a seat at the table and in 1901 he succeeded Sir John Tenniel as chief cartoonist. He had practically no artistic education, but developed for himself an original style after first showing some inclination to the methods of Leech and Keene. He displayed ingenuity and firmness of touch, and a classic feeling for line. He was perhaps the least humorous of the *Punch* artists, being weighted with a strain of seriousness and dignity. He illustrated Burnand's 'New History of Sanford and Merton' (1872); Kingsley's 'Water Babies' (1885); 'Hans Andersen's Fairy Tales' (1887), etc.

SAMBRE, säⁿbär, river of France and Belgium, a tributary of the Meuse. It rises in the northern part of the French department of Aisne, flows between steep and rocky heights, receives several smaller streams, and finally, after a very tortuous course, empties at Namur into the Meuse. The Sambre is 110 miles long. It is navigable from Landrecies for 148 kilometers, and from that point for 67 kilometers is canalized, having 10 locks. The Sambre Canal passes southward as far as Oise, connecting the Seine and Maas. Practically the vicinity of the entire length of the river in France formed a vast battlefield after the Teutonic armies had invaded France in the early part of the great World War.

SAMBUKE, an ancient musical instrument; though applied sometimes to several musical instruments of different kinds, such as a lyre, a dulcimer, a triangular harp or trigon and the large Asiatic and Egyptian harps.

SAMBUR, a large deer (*Cervus unicolor*), widely distributed throughout southeastern Asia, and especially the hill country of India and the species of most importance to the sportsman. Large bucks approach five feet in height at the withers, and may exceed 500 pounds in weight. The antlers are large and rough, have the brow-tine sprouting at an acute angle with the beam instead of at or near a right angle, and dividing into two subequal tines at the extremity; the beam sometimes exceeds 40 inches in length in fine specimens from the Bay of Bengal. The color is properly a uniform deep brown, but paler and less handsome hues are often seen; the hair is long and wiry, and forms an erectile mane on the necks of full-grown stags. This deer is an inhabitant of the woodlands, coming out to graze on the hill-slopes, at times, for like the wapiti it subsists mainly upon grass and herbage, but never far from a refuge in the jungle; yet at certain seasons browses the new twigs, or seeks for fruits. There is great variety in their circumstances and habits throughout the wide area of the distribution of this species, and consequently a puzzling amount of variation in their form and appearance, so that several separate species have been without good reason, as further study has shown. Consult Blanford, 'Mammals of India' (1888); Lydekker, 'Deer of All Lands' (1898).

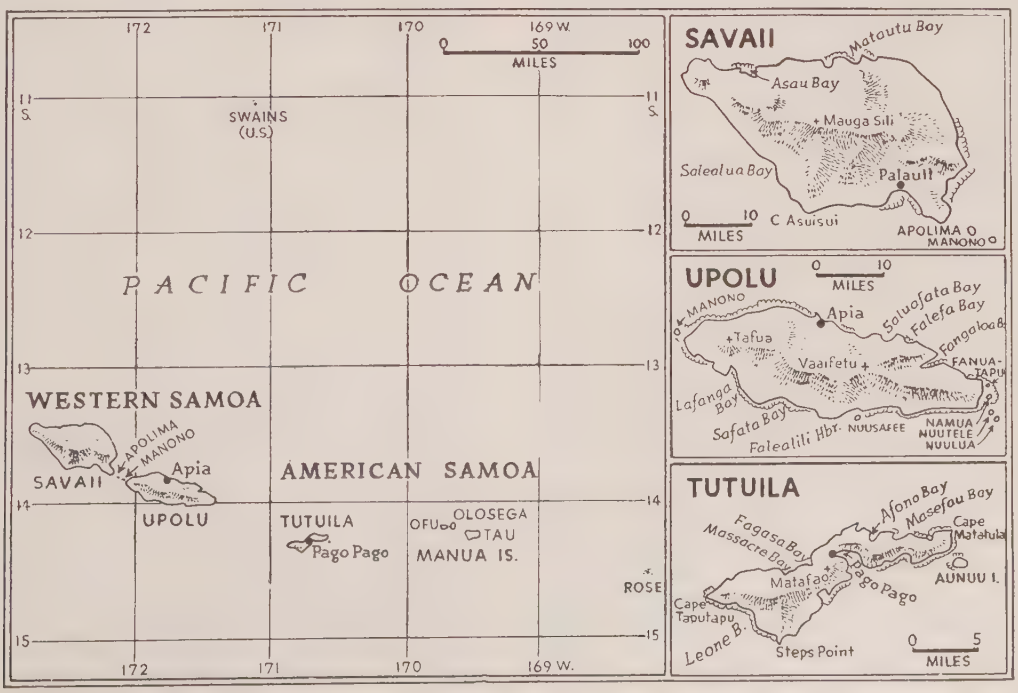
SAMIAN WARE. See ARRETINE WARE.

SAMNITES, an ancient people sprung from the Sabines and inhabiting the province of Samnium, in lower Italy. They were divided into four nations: the Caraceni in the north, capital, Aufidena; the Pentri in the center, capital, Bovianum, who constituted the most powerful nation of the Samnite stock; the Caudini in the southwest; the Hirfrini in the south, capital, Beneventum. The Samnites are described in Roman history as a people fond of war and of liberty, who were brought completely under the Roman yoke after long and bloody wars which continued, with few interruptions, 53 years. After the most fatal defeats, and the entire devastation of their country, the Samnites, together with the other nations which had assisted them, found themselves obliged to submit to the supremacy of Rome, 290 B.C. When the Italian allies of Rome revolted against her in the year 90 B.C., the Samnites once more rose against their oppressors, and fought with desperation. But Sulla entirely subdued them, and commanded that every Samnite should be put to death. Three days after the battle he ordered 4,000 of them who had been taken prisoners to be put to death on the Campus Martius. The few that remained, lived from that time scattered in villages. The Samnites cultivated various arts and manufactures, for the proximity of the refined Greeks in lower Italy had a very beneficial influence upon them. Even their laws and constitution were borrowed in a great degree from the Greeks. Their form of government was democratic. At the commencement of a war they were accustomed to choose a common general.

SAMOAN ISLANDS, an archipelago in the South Pacific about 2,700 miles east of the northern tip of Australia and 2,200 miles south of the Hawaiian Islands. The group, extending over a distance of 350 miles, comprises 14 islands having an aggregate area of 1,209 square miles and a population of 102,033. All of the islands east of longitude 171°W., together with Swains Island (q.v.), constitute American Samoa, which has an area of 75.3 square miles and a population (1950) of 18,937; west of that longitude is Western Samoa (formerly German and administered by New Zealand after World War I), 1,133 square miles in area and having a population (1951) of 83,096. American Samoa comprises (in addition to Swains Island) Tutuila (52 square miles); the Manua group, consisting of the islands of Tau, Olosega, and Ofu; Aunuu, administered as part of the Eastern District of Tutuila; and Rose, an uninhabited coral atoll. Western Samoa consists of the two large islands of Upolu (430 square miles) and Savaii (703 square miles); the small islands of Manono and Apolima; and the islets of Fanuatapu, Namua, Nuutele, Nuulua, and Nuusafee.

Physical Features.—All the Samoan Islands are peaks of a submarine chain of volcanic mountains. Barrier reefs encircle the large islands more or less, and especially Upolu. Brown and bare in many places at low water, the reefs are submerged at high tide, when the surf bursts upon them in miles of snowy whiteness. Between the outer reef and the shore stretches a lagoon of multitinted waters, varying in width from 200 yards to two and three miles; this generally smooth belt of water is, in effect, a canal encircling the islands, and is the highway along which most intercourse is had between different points of the islands. Lofty mountains rise in the interior, leaving broad stretches of comparatively level land bordering the shore and reaching up to low-lying foothills. In many places the sides of the mountains are not far from perpendicular yet, such is the climate, they are held in place by the network of growth that covers them. Over the surface of the islands is spread a tropical forest of often giant trees.

Savaii, the most westerly of the Samoan Islands, is much the largest and most rugged; it has a length of 47 miles and a maximum breadth



of 27 miles. The interior is occupied wholly by mountains, Mount Mauga Sili, the highest peak, rising to 6,094 feet. All the large villages, numbering about 30, are found along the edge of the shores.

Ten miles east of Savaii is Upolu, in many respects the most attractive island of the archipelago; it is 46 miles long and 16 miles in breadth. The highest of the island's numerous peaks is Mount Vaaifetu, 3,608 feet; Mount Tafua, 2,195 feet in height, is an extinct volcano at the western end of Upolu. On the seacoast nine miles northwest of Vaaifetu is the town of Apia, capital of Western Samoa and the territory's port. The harbor, however, is small and poorly sheltered from the northerly gales which occur during the hurricane season (January to March). On March 16, 1889, warships of Germany, the United States, and Great Britain, at that period with competing interests in Samoa (see *History*), were struck by a hurricane at Apia which cost the lives of 92 German and 54 American seamen and the loss of several vessels. The disaster was described in *A Footnote to History* (1892) by Robert Louis Stevenson (q.v.), who established a home at Vailima, near Apia, in 1890.

Apolima is a small island midway between Upolu and Savaii, and within the sea reef at the western end of Upolu lies the island of Manono, little more than a barren rock, which has played a great part in the history of the group. It has been the cradle of a feudal aristocracy and the focus of native politics, its chiefs holding a commanding influence in all Samoan affairs.

About 40 miles off the eastern coast of Upolu is Tutuila, largest island of American Samoa, about 25 miles long and 5 to 6 miles wide in the widest part. A mountain range extends nearly the whole length of the island, with spurs on either side and indentations of deep valleys. Near the center of the island is Mount Matafao, 2,141 feet; other peaks include Mount Piua, 1,700 feet, and Mount Alava, 1,600 feet in height. Except at the foot of the mountains along the coast, and a broad, fertile plain in the southwestern part of the island, there is little level land. Pago Pago Bay, the safest and best harbor in the South Pacific, has its entrance to the southward and nearly cuts the island in two; on the southern shore of a western arm of the harbor, about a mile from the open sea, stands the United States Naval Station, from which American Samoa was administered by a naval governor until 1951.

The island of Aunuu, about 300 acres in extent, lies about a mile off the southeastern shore of Tutuila, and 65 miles due east of Tutuila is the Manua group, the three islands aggregating 22 square miles in area. Tau (17 square miles), rises to two peaks in the center of the island—Lata, 3,056 feet, and Olomatimu, 2,961 feet; and 6.5 miles northwest of Tau are the little islands of Olosega and Ofu (together, 5 square miles), separated by a narrow strait and which reach the heights, respectively, of 2,095 and 1,587 feet. Rose Island is 70 miles east of Tau.

The climate of the Samoan Islands is tropical but equable. Strong southeast winds blow from May to November, and during the other months the winds are variable; moderate gales and occasional hurricanes have been experienced. The rainy season extends from December to March, the average yearly rainfall being about 193 inches. The temperature is highest during the summer months (December–February) and coolest in the winter months (June–August); the yearly temperature ranges from 90° to 70°F.

The People.—The Samoans are Polynesians (q.v.), of splendid physique, handsome, vigorous, and of tremendous strength. Never having been subject to the inroads of alien races and the consequent admixture of blood and speech, the people have preserved uncorrupted and unchanged many of their original racial characteristics. The Samoan language is probably the oldest form of Polynesian speech extant; it is closely related to the Maori, Tahitian, Hawaiian, and Tongan languages. The social organization is based upon the clan, and the chiefs, who are elected, have great authority. The most striking feature of every village is the *faletele,* a house where the native council meets, which is often of considerable size. Originally polytheistic, the Samoans are now Christians, Protestant and Roman Catholic missionaries having worked long among them. All mission bodies maintain schools, these supplementing the school systems operated by the two governments in the islands.

American Samoa.—American Samoa is classified as an unincorporated United States possession. After 51 years under naval administration it was, on July 1, 1951, placed under the jurisdiction of the secretary of the interior, who appoints the governor. The chiefs of Tutuila ceded that island and Aunuu to the United States on April 17, 1900, and the chiefs of the Manua group likewise ceded their islands on July 16, 1904; on March 4, 1925, by joint resolution of Congress, the United States annexed Swains Island (q.v.), which lies 210 miles north of the Samoan Islands, and this is administered as part of American Samoa. The inhabitants, citizens of American Samoa, are nationals only of the United States. Advisory to the governor is the Legislature, or Fono, of American Samoa which, as reorganized in 1952, comprises a 15-member House of Alii, or Senate (5 chiefs representing each of three districts) and an 18-member House of Representatives, which is elected by universal suffrage and secret ballot. For the purpose of local administration American Samoa is divided into three districts, each of which has a native governor responsible for welfare and good order; in each district, in turn, are county chiefs and village chiefs to whom responsibilities are delegated. Education is compulsory between the ages of 7 and 15. During 1953–1954, there were 55 public schools (52 elementary, with 4,909 pupils; 1 high, 144 pupils; 1 vocational, 46 pupils; and 1 teacher-training school, 11 pupils), and 6 private and parochial schools with 961 pupils. Appropriations in 1954–1955 for education totaled $256,500. Elementary teachers (Samoan) average $800 in salary annually; high school teachers (American), $4,000 and other benefits. The literacy rate is estimated at 94 per cent.

Western Samoa.—Formerly a possession of Germany, Western Samoa came under administration of New Zealand on Dec. 17, 1920, as a mandate of the League of Nations. The head of government is a high commissioner, appointed by the Dominion of New Zealand, who is also responsible for the Tokelau (or Union) Islands (q.v.), a small group north of the Samoan Islands. He is assisted by a Council of State consisting of two Samoan *fautua* (leading chiefs) and by a 25-member Legislative Assembly (the 2 *fautua,* 12 elected Samoans, 5 elected Europeans, 6 officials). Schools in 1952 numbered 477, including 113 gov-

ernment schools (13,158 pupils) and 364 denominational mission schools (19,636 pupils). Samoa College (primary and secondary departments) was opened at Apia in 1952.

Production and Transportation.—The soil of the Samoan Islands is extremely fertile. The natives cultivate the yam and taro as foodstuffs, and the breadfruit, pineapples, oranges, bananas, and other tropical fruits do well; many of the men are expert fishermen. The natural resources of American Samoa are of no economic importance, but the natives (there are few white planters) cultivate coconuts on a considerable scale from which they make copra; this product, and mats woven from local grass and leaves, are the chief exports. Western Samoa has several crops of economic value. Cocoa, coconuts, and rubber have been cultivated since the time of the German possession of the territory, and bananas later became an important item of export. While most of the cultivable area of about one million acres consists of inalienable native lands, white planters own 20,000 acres and more is available on lease. Roads total 70 miles in American Samoa and 260 miles in Western Samoa. There are steamship and air connections between the Samoan Islands and the west coast of the United States, Australia, New Zealand, Fiji, and Tahiti.

History.—The Samoan Islands were discovered about 1722 by Jakob Roggeveen, the Dutch admiral, who did not land but named some of them, possibly the Manua group, the Baaumann Islands. In 1768 Samoa was visted by the French nagivator Louis Antoine de Bougainville, who gave the archipelago the name of Navigators' Islands, and during 1787 Comte de La Pérouse (Jean François de Galaup) spent several weeks in and around the islands; 11 of the latter's crew who landed on Tutuila for water were killed by the natives. The British warship *Pandora* touched at Samoa in 1790, and in 1824 the islands were visited by Otto von Kotzebue, the Russian navigator. In 1830, John Williams of the London Missionary Society arrived, and in 1835 a Wesleyan mission station was established on Manono. Roman Catholic missionaries settled on Savaii in 1845, and before the close of the 19th century Christianity had been accepted by all Samoans.

Meanwhile, however, the political history of the islands was most turbulent. An agreement was made in 1838 between native chiefs and the commander of the British warship *Conway* permitting foreign vessels to use Samoan ports on payment of dues, and in 1839 a United States expedition under Charles Wilkes undertook the first thorough survey of the archipelago; Wilkes also raised the American flag at the harbor of Pago Pago, but the intended annexation was not confirmed by Congress. At about this period numerous white men—mostly Americans, British, and Germans—settled on the islands and took Samoan wives, and it was not long before Apia, on Upolu, became the headquarters of white settlement. German traders and planters became very active in the most westerly of the islands, and because of the commercial interests involved, consuls were appointed at Apia by Great Britain in 1847, by the United States (which employed the term Commercial Agent) in 1856, and by Germany in 1861. From this time the chiefs ruled only under the direction of the three consuls, but the former soon fell to fighting one another and the latter, motivated largely by commercial rivalries, became mutually suspicious and jealous. Peace was made between the rival native rulers in 1873, a house of nobles and a house of representatives being established at Apia, and Malietoa Laupepa and the chief of the royal house of Tupea becoming joint kings. In 1880, Malietoa was recognized as king by the three powers, but in 1887 was deposed by the Germans on the charge of unjust treatment of German nationals and was deported from New Guinea, being transferred first to the Cameroons, in West Africa, and then to Hamburg. In spite of the protests of the American and British consuls, Tamasese was proclaimed king by the Germans, but he was succeeded in 1888 by Mataafa, near relative of Malietoa, who had defeated Tamasese in battle.

Meanwhile, when the United States warship *Narragansett* visited Pago Pago in 1872 the senior chief of Tutuila sought vainly to place the island under American protection, and in 1877 a party of leading Samoans went to Fiji to request British protection for the entire archipelago. When this was denied the natives made a like fruitless visit to Washington, D.C., but there made an agreement in 1878 with Secretary of State William Maxwell Evarts ceding Pago Pago as a coaling and naval station and granting commercial and extraterritorial rights to the United States. In 1879 Germany made a similar treaty with the Samoans, obtaining practical control of the harbor of Saluafata, near Apia, and exceptional power in the adjustment of affairs between German nationals and natives; and the same year Great Britain also secured a naval station and other privileges. But these concessions appeared merely to increase the friction in Samoa, and tension grew so great that American, German, and British warships were anchored at Apia in 1889 to give support to their respective consuls. As noted above, a fierce hurricane in March wrecked several of the vessels, and the differences between the powers resulted in a conference at Berlin where, on June 14, 1889, a tripartite treaty was concluded. The Samoan Islands became neutral territory with an independent government and Malietoa was called from exile and made king, the authority of the consuls being restricted to the municipality of Apia and the island of Upolu, and an extraterritorial court, presided over by an American judge, had jurisdiction in matters affecting foreigners. A commission, appointed to investigate titles to land alleged to have been purchased from the natives, finished its work in 1894, and confirmed 75,000 acres of land to Germans, 36,000 to British, and 21,000 to Americans. Samoa did not, however, remain independent for many years. Continued rivalry between native chiefs led to large-scale fighting in 1898, and as a result Germany, the United States, and Great Britain annulled the next year the Berlin Treaty of 1889. By an agreement signed on Dec. 2, 1899, the Samoan Islands were divided among the three powers and the kingship abolished, but Britain withdrew all claims to a share in the territory in exchange for surrender by Germany of rights in Tonga, certain of the Solomon Islands, and Niue. Under the agreement, the United States retained Tutuila and all other islands of the Samoan group east of longitude 171° west of Greenwich, while Germany obtained all the Samoan territory to the west of the American holdings. King Oscar II of Norway and Sweden was made arbitrator to determine and adjudge the amount of claims due to citizens of the British, German, and American governments having pos-

sessions on the islands and affected by recent military operations there. American Samoa was placed in charge of a naval governor, and German Samoa became a colony administered by an imperial governor and a native chief assisted by an advisory council.

German Samoa was defenseless when World War I broke out in 1914. A New Zealand expeditionary force, escorted by an Australian squadron, arrived off Apia on August 29, and the colony was surrendered the next day. Military occupation of the country continued until 1920, when New Zealand was named mandatory power to govern Western Samoa and thereupon created a civil administration. The history of Western Samoa during the next 15 years was a record of almost unceasing political disputes, the natives bitterly resenting the fact that they were accorded virtually no share in local government. Many of the white people living in the mandate supported the efforts of the Mau, a nationalistic organization, to participate in public affairs, but it was not until 1936 that the government of New Zealand permitted that body to do so. During World War II, the Samoan Islands were free from enemy attack; from 1942 until the end of the conflict, the United States operated a large air base on Upolu, the principal island of Western Samoa, and made extensive use of American Samoa, particularly the excellent harbor of Pago Pago.

On Nov. 11, 1946, the New Zealand government issued proposals for transforming its League of Nations mandate for Western Samoa into a United Nations trusteeship. The plan was approved by the United Nations General Assembly on December 13, and the trusteeship became effective on Jan. 25, 1947. Early in 1947, the United Nations Trusteeship Council received a petition by leading chiefs of Western Samoa requesting self-government and asking that the Western and American Samoas be rejoined. The New Zealand government, through which the petition had been forwarded, supported the plea for self-government. In April 1947 the council sent a mission to Western Samoa to study the merits of the petition for self-government, but the council was unable to act on the request that the archipelago be reunited, because the United States had submitted no trusteeship agreement covering American Samoa. The commission's report, endorsed by the council on Dec. 5, 1947, called for establishment of a "Government of Western Samoa," with the high commissioner representing New Zealand to be assisted by a Council of State containing Samoans, and a Legislative Assembly having a Samoan majority. The Council of State was created in 1947, and the Assembly was inaugurated at Apia in May 1948. A convention was called for late 1954 to discuss proposed constitutional changes and define the relationship between New Zealand and a future self-governing state of Western Samoa. Meanwhile, jurisdiction of American Samoa had been transferred on July 1, 1951, from the Navy Department to the Department of the Interior.

SAMOS, sā'mŏs, an island in the Aegean Sea, one of the Sporades, 45 miles southwest of Izmir (Smyrna); it is separated from the Turkish mainland by a strait only one mile in width. It has an area of some 180 square miles, and the population numbers 71,000 (est. 1946). There are several good harbors on the coast, and the island is traversed by two rocky and barren mountain ranges, the highest peak of which is Mount Kerkis (4,725 feet), relieved by forests of pines. Olive groves are plentiful on the lower slopes of the mountains. Vathy, on the northern side of the island, is the capital and chief port. On the south side lies Khora, the former capital, which stands on the site of the famous temple of Hera. Samos was the birthplace of Pythagoras (q.v.). Colonized by the Ionians about 1000 B.C., the island passed to the Persians in the 6th century but regained its freedom after the victory of Mycale, 479 B.C. The Romans captured Samos in 84 B.C. In 1832 it passed under Turkish suzerainty but enjoyed considerable autonomy under a Greek governor and legislature. It was seized by the government of Greece in 1912, and that country's sovereignty was confirmed in 1923 by the Treaty of Lausanne.

SAMOSATA, sā-mŏs'ā-ta, a ruined city of ancient Syria, located on the right bank of the Euphrates. On its site is the modern Turkish village of Samsat, east of Maras and northwest of Urfa. Occupied in early history by the Hittites, Samosata was absorbed into the Assyrian Empire in 708 B.C.; and it became capital of Commagene when that district obtained its independence. In 72 A.D. it became subject to Rome. It was the birthplace of Lucian (q.v.), the Greek satirist and wit and of the heretic Paul of Samosata (q.v.). The majority of the inhabitants of Samsat are Kurds, their predecessors having been Armenians.

SAMOSATIANS or **PAULIANISTS.** See PAUL OF SAMOSATA.

SAMOTHRACE, săm'ō-thrās, or **SAMOTHRAKE,** an island of the Aegean Sea, about 40 miles northwest of the entrance to the Dardanelles, and nearly opposite the mouth of the Maritsa (ancient Hebrus), 36 miles from the coast of Thrace. It is rugged and mountainous and of almost oval form; its highest summit, Saoce, reaches an elevation of 5,248 feet. On the northern coast are sulphur springs of considerable renown. The principal products are grain, wood, oil, honey, and wax, and on the coast there is a considerable sponge fishery. In the northern part of the islands the ruins of ancient Samothrace were found (1873–1875), consisting of Cyclopean walls; a Doric temple of marble and another of circular form. Samothrace was of importance from early times and is frequently mentioned in the works of Pliny, Homer, and others. Here Poseidon witnessed the contests between Greeks and Trojans on the plains of Troy. But its chief renown was due to its having been the seat of worship of the Cabiri (Cabeiri, q.v.), and to its religious mysteries, supposedly derived from the Pelasgians. The island is once mentioned in history in connection with the expedition of Xerxes, one of its ships having taken a conspicuous part in the famous battle of Salamis. The island was first colonized by Phoenicians, afterward joined by Greeks. It always en-

joyed autonomy, partly owing to its sacred character, partly to its lack of political importance — due to the fact of its having no good harbor. Saint Paul visited the island in the course of his second missionary expedition (Acts xvi, 11). The inhabitants are mostly Christians. Pop. 3,500. Samothrace, with all the other Ægean Islands, was in the possession of Greece and Italy in 1918, and by the Treaty of Lausanne, 1923, was awarded to Greece.

SAMOVAR ("self-boiler"), a Russian table kettle in which the water (for tea, etc.) is kept boiling by glowing charcoal in a vertical iron tube through the centre.

SAMOYEDES, săm'oi-dēz, or **SAMOIEDES,** a Mongolian people inhabiting the shores of the Arctic Ocean, from the Kanin Peninsula, on the eastern shores of the White Sea, in European Russia, to the Gulf of Khatanga, in the northeast of the government of Yeniseisk, Siberia. They consist of three principal tribes, speaking different dialects. Their origin is unknown, but they are supposed to have come from more southern regions, and have been erroneously confounded by the Russians with the Laplanders, whose country, called in the Lapland tongue, Sameanda has probably given them their name. They are nomadic and live chiefly by fishing, hunting and keeping reindeer. Their principal wealth consists in herds of reindeer, which supply them with food, clothing, tents, utensils, etc. They are of small stature, usually between four and five feet; have a flat, round and broad face, thick lips, wide nose, little beard, black hair, in small quantity. They are extremely superstitious and generally peaceable. They are unacquainted with the art of writing, their traditions being imperfectly preserved only in their songs. When Russian expansionists first became acquainted with them they had already been driven from their native seats by the Tatars, and separated from their kindred tribes.

SAMP, originally an Indian article of food consisting of maize, broken or bruised, which is cooked by boiling and eaten with milk.

SAMPAN, a boat of various build used on the Chinese rivers, in Straits Settlements and elsewhere, for the conveyance of merchandise, and also frequently for habitation. They are swift sailers both with oar and sail.

SAMPHIRE, an umbelliferous plant (*Crithmum maritimum*), pale-green with bi-triternate leaves and fleshy very succulent leaflets, and umbels of small yellowish flowers followed by fennel-like fruits. It grows wild along the rocky shores of northwestern Europe, near the water, and when abundant, is used as a pickle, salad or potherb. It can also be cultivated in gardens, if not too far from the coast, and if supplied with plenty of sait and soda solutions. The name is a corruption of the old French "herbe de Sainte Pierre," and it is also called in England Saint Peter's-wort.

SAMPLE, Robert Fleming, American Presbyterian clergyman: b. Corning, N. Y., 19 Oct. 1829; d. New York City, 12 Aug. 1905. He was graduated from Jefferson College in 1849. From 1853 he was engaged in various pastorates in Pennsylvania and Missouri until 1887 when he assumed charge of the Westminster Presbyterian Church, New York, where he remained and was pastor emeritus from 1902 till his death. He was professor of Christian ethics in Lincoln University, was editor of 'North and West' in 1895–1902, traveled widely in Europe and Palestine, and was connected with numerous religious educational and religious organizations. He published 'Early Dawn' (1861) 'Memoir of Rev. John C. Thorn' (1868); 'Beacon Lights of Reformation' (1889); 'Elements of Pulpit Power' (1901), etc.

SAMPLERS. A strip, or square of linen, or canvas, recording specimen stitches and patterns, was, for hundreds of years, worked by every young girl of aristocratic and well-to-do families. The sampler had the double value of giving the child skill as she worked it and of serving as a guide and source of reference all the rest of her life. The sampler ceased to become a part of education in the middle of the 19th century. After 50 years of oblivion, it came into prominence in a new way, to enjoy fame by appealing to the fancy of the collector. The first and finest collection was made by the late A. W. Drake and is now scattered. A splendid collection is in the South Kensington Museum, London. Although no earlier examples exist than the 17th century, the sampler, which is nothing more nor less than a pattern-book for the embroiderer, is probably as old as the art of embroidery (q.v.) itself.

The embroiderer was seldom the designer of the decoration that grew beneath her needle. The sampler was, therefore, a kind of notebook (corresponding to the artist's sketch-book), exhibiting various stitches and suggestions for embroidery, or for making cross-stitch letters, numbers, patterns, etc. It was, consequently, of both artistic and practical value. The name tells plainly what it is.

Chaucer uses the word *ensampler* as a synonym for pattern, and the poet Skelton (1469–1529) speaks of "the sampler to sew on, the lacis to embraid." The inventory of Edward VI (1552), mentions "a sampler, or set of patterns, worked in Normandy in green and black silks." Shakespeare mentions it twice — in 'A Midsummer Night's Dream,' when Helena reminds Hermia that they worked together on a sampler, and in 'Titus Andronicus' in reference to the Greek story of Philomela. From the 16th century samplers are constantly met with in records and diaries and even in wills, for they were deemed worthy of special bequest. Samplers of the 16th and 17th centuries often contained insertions of reticella or cutwork (see LACE), drawn-work and patterns for needle-point lace; for although pattern-books of lace were published, they were hard to procure and the supply was limited.

The evolution of the sampler is as follows: First, the sampler consisted of decorative pictures thrown here and there upon the surface of a piece of canvas; then came designs placed in orderly rows and making in themselves a harmonious whole; next, alphabets and numerals chiefly for the use of these who marked the linen; and next, imitation of tapestry pictures by the addition of figures, houses, birds, animals and flowers. Last of all the sampler was adopted as an educational task in a dame's school as a specimen of a pupil's phenomenal achievement at an early age.

The sampler was used in all European countries; and beautiful specimens of Spanish, French, Italian, Dutch and German work exist. To us the English examples are the most interesting because the American samplers are English in character of workmanship and design.

The earliest of all known samplers is in this country. It is owned by the Essex Institute in Salem, Mass., and was worked by Ann Gower, the first wife of Governor Endicott. She came to Salem in 1628 and died in 1629. The sampler was, of course, worked in her girlhood in England. The upper part consists of the alphabet and the lower contains examples of needle-work. Another early sampler, worked by Loara Standish, daughter of Captain Miles Standish, is preserved in Pilgrim Hall, Plymouth, Mass.

The age of a sampler is told by the character of the designs and lettering, coloring, border and insertions. The earliest samplers are long and narrow. A conventional strawberry and oak leaf, or acorn, appears in almost every 17th century sampler. The rose is very frequent, but is not so much used as the "Persian pink," or carnation.

The curious human figures with outstretched arms, known as "Boxers," appear between 1648 and 1742. When they disappear, their place is taken by Adam and Eve in the garden of Eden. During the early part of the 18th century the sampler consisted exclusively of long sentences worked in silks of every imaginable hue. A peculiar mustard-colored linen was introduced as groundwork for the stitches after 1700. Toward the middle of the century blues, greens, yellows and blacks were the prevailing colors for the silks. The stag, which had appeared but rarely before 1700, now became the fashion and continued to be worked as long as samplers were made. About 1728 the border encircled the whole sampler; and it is noticeable that as the variety of patterns decreased the sampler became shorter. From 1740 onward the border always appears and the sampler is a picture instead of a pattern-sheet. Next, the border develops into a wreath of naturalistic flowers. A few dates of decorations will aid the curious in determining the period of any sampler. Alphabets, name of the maker, rows of ornaments, stag (occasionally), and Boxers date from 1648; numerals, 1655; inscriptions, 1662; crown, 1691; motto or text, 1686; verse, 1696; Adam and Eve, 1709; border, 1726; floral border, 1730; fleur-de-lis, 1742; flower in vase, 1742; heart, 1751; stag (commonly used), 1758; house, 1765; mustard-colored canvas, 1728; Spies to Canaan, 1804; crewels replace silk, 1820.

The inscriptions consist of moral sayings, allusions to death and its terrors, hymns, melancholy and lugubrious verses and quotations from the Bible. Sometimes an entire Psalm was worked in letters as clear and neat as those of a printer. The plodding needle also took for its task the Lord's Prayer, or the Ten Commendments. Sometimes, too, the sampler was worked with the names and dates of birth and death of an entire family, proving once again that needlework occasionally fulfilled its ancient purpose of recording events. See EMBROIDERY.

In the 18th century maps were worked on samplers in the dame's schools for the double purpose of teaching geography and needlework. Many of these survive. Darning samplers were made in the 19th century. These show various kinds of darning stitches suitable for mending certain textiles, and are arranged in circles and squares around a basket, or a vase of flowers. Consult Huish, Marcus B., 'Samplers and Tapestry Embroideries' (London 1900); Jourdain, M. A., 'English Secular Embroidery' (London 1910); Earle, Alice Morse, 'Home Life in Colonial Days' (New York 1898), and 'Child Life in Colonial Days' (New York 1899); *Century Magazine* (1912).

SAMPSON, Archibald J., American diplomat and author: b. near Cadiz, Ohio, 21 June 1839. He was graduated from Mount Union College, Ohio, in 1861 and from the Cleveland Law School in 1865; served through the Civil War in the Union army, starting as private and attaining the rank of captain; was admitted to the bar in 1865 and settled in Sedalia, Mo., where he engaged in the practice of law. There he was successively city, county and district attorney. He removed to Colorado in 1873, locating in Canyon City and establishing his law practice. There he was again county attorney and in 1876 was elected attorney-general of the State. In 1889 President Harrison appointed him American consul at Paso del Norte, Mexico. On leaving there he located in Phoenix, Ariz. In 1897 President McKinley appointed him Envoy and Minister of the United States to the republic of Ecuador, where he remained until 1907, being the first person for over 60 years living in a territory to receive a diplomatic appointment. After his return to the United States he spent a good part of his time lecturing on "Masonry as seen in Foreign Lands," and other subjects. Mr. Sampson was past department commander, Arizona Department of the G. A. R. He died 24 Dec. 1921.

SAMPSON, Deborah, American heroine: b. Plymouth, Mass., 17 Dec. 1760; d. Sharon, Mass., 29 April 1827. She served in the Continental army for three years during the Revolutionary War, disguised as a man and bearing the name of Robert Shurtleff. She gained a reputation for coolness and courage in action and was engaged in many daring enterprises. She was wounded by a sabre cut on the temple in a skirmish near Tarrytown and later was shot through the shoulder. During the Yorktown campaign she was seized with brain fever and her sex was discovered. She was discharged by Washington, receiving from him a note and a purse of money and later was invited to the capital, where Congress voted her a pension and a grant of lands. She published her experiences under the title 'The Female Review' (1797; new ed. with introduction and notes by Rev. John A. Vinton, 1866).

SAMPSON, William Thomas, American naval officer: b. Palmyra, N. Y., 9 Feb. 1840; d. Washington, D. C., 6 May 1902. In 1860 he was graduated from the United States Naval Academy, where he had been the highest officer of the cadet battalion. His first assignment was on board the frigate *Potomac*. He was promoted lieutenant, 16 July 1862 and two years later became executive officer on the ironclad *Patapsco* of the South Atlantic blockading squadron. He held the watch, 15 Jan. 1865, on the turret roof of the *Patapsco* when that vessel was blown up and sunk by a torpedo in Charleston Harbor. Only his own coolness

saved his life in that catastrophe. He became lieutenant-commander in 1866 and commander in 1874. In the autumn of the last-named year he was detailed for the third time as instructor at the Naval Academy and remained there four years in charge of the department of physics. Later he became assistant superintendent of the Naval Observatory, and in 1884 was a member of the International Prime-Meridian and Time Conference at Washington. He was superintendent of the torpedo station at Newport, 1885–86; representative to the International Marine Conference at Washington in 1886, and superintendent of the Naval Academy 1886–90, where he introduced great improvement in the state of training. In 1889 he was promoted captain and later put in command of the *San Francisco,* the first steel cruiser of the new navy. During his term as chief of the Bureau of Naval Ordnance, 1893–97, the use of smokeless powder was perfected by experiments conducted under his supervision. Upon quitting this post he was put in charge of the battleship *Iowa,* which had been placed in commission in June 1897, and with this ship he took his place as senior captain in the North Atlantic squadron. On 17 Feb. 1898, two days after the battleship *Maine* was blown up in Havana Harbor, he was appointed president of a board of inquiry directed to investigate the causes of that disaster. On 22 March the investigation was concluded and Captain Sampson, promoted to the rank of acting rear-admiral, succeeded Admiral Sicard in command of the North Atlantic squadron. Upon the declaration of war with Spain, 21 April, he was ordered with his fleet to blockade the northern coast of Cuba. A few days later the Navy Department was informed of a Spanish fleet under Admiral Cervera having sailed from the Cape Verde Islands toward Cuba. Admiral Sampson was forthwith ordered to intercept this fleet in its supposed progress to the relief of Havana. On 1 June he arrived off Santiago, where the Spanish fleet had meantime been located and at once effected a strict blockade. On 3 June, under his orders, an unsuccessful attempt was made by Naval Constructor R. P. Hobson and others to prevent egress of the Spanish fleet by sinking the *Merrimac* in the channel entrance to the harbor. On the morning of 3 July Sampson had withdrawn on the flagship *New York* and was proceeding to Siboney for a conference with General Shafter, the commander of the land forces, when it was discovered that the Spanish ships were leaving the harbor of Santiago. The *New York* was put about and, under full steam, overtook the blockading fleet already giving battle under the direction of Commodore Schley, commander of the flying squadron and second in command of the blockading fleet. The entire Spanish fleet was destroyed and Admiral Cervera was captured. After the close of the war a long and bitter newspaper discussion ensued over the question whether the chief honors of this victory belonged to Sampson or Schley. A court of inquiry which met three years later, at the request of Schley, decided against his claims, but the controversy prevented Congress from awarding any official recognition to Sampson for his success. For two years from October 1899 Admiral Sampson held command of the Boston Navy Yard. In October 1901 he was placed on waiting orders; his health was much impaired; he was retired from active service 9 Feb. 1902, and resided in Washington until his death.

SAMSHUI, China, a treaty port in the province of Kuang-tung, situated on the river West, about 100 miles west of Canton. The town is small, but favorably situated for foreign trade

SAMSON, one of the judges over Israel. He was of the tribe of Dan, and the circumstances attending his birth, heralded as it was by an angel, his consecration as a Nazarite, and those visitations of the Spirit of the Lord through which he was enabled to perform feats of heroic might, marked him out as a man raised up to meet a national emergency. The first recorded instance of the exercise of his great strength is in connection with his marriage to a daughter of the Philistines. At the wedding-feast Samson proposed a riddle to the guests, wagering 30 shirts and as many suits of clothes that they could not guess it in seven days. The secret of his riddle being betrayed to them by his wife, Samson went to Askalon, killed 30 Philistines and gave their clothes to his guests. His wife having, during his absence in his own country, married again, he caught 300 foxes and tying them together tail to tail, with a fire-brand between them, let them loose in the fields of the Philistines. His own countrymen bound and delivered him into the hands of his enemies, but he snapped the cords asunder and killed 1,000 Philistines with the jaw-bone of an ass. From this period Samson was judge of Israel for 20 years. While on a visit to Gaza the gates of the city were closed upon him by the Philistines, whose intention it was to kill him, but he rose and carried off the gates to a distance of 20 or 30 miles. Not long after he fell in love with Delilah, to whom he revealed the secret of his strength, and she by cutting off his hair deprived him of his powers and betrayed him to his enemies, who put out his eyes and set him to work in a mill with slaves. At a great festival in honor of Dagon Samson was brought out to furnish sport to the Philistines. But his hair had grown again, and his vigor having returned with it, he took vengeance on his enemies by pulling down over their heads the building in which they were assembled. Milton has made his death the subject of a drama — 'Samson Agonistes' (1671), Handel that of an oratorio, 'Samson' (1743) — and his exploits have been illustrated in the woodcuts of Dürer, and the paintings of Guido Reni, Rembrandt and Rubens.

SAMSON AGONISTES, a tragedy in blank verse and irregular meters, the final work of the English poet, John Milton, was published in 1671. In substance the drama is based on the story of Samson in Judges xiii–xvi; in form it follows rigorously the model of classical tragedy.

The action is limited to the final episode of Samson's life, his destruction of himself and great numbers of the Philistines by pulling down the pillars of their theatre, at a public festival to which he had been brought as a captive to entertain the populace. Preparation for the catastrophe is made by a series of events, comprised in a single day, which rouse Samson to make final use, for the glory of the

Hebrew God, of the power which had been entrusted to him and which through his own sin he had temporarily lost. A chorus of Hebrews reviews the events of Samson's life and interprets the changing emotions of the action.

The intensity of feeling which Milton has put into his picture of Samson is due to the analogy which he felt between the lot of his hero, a chosen champion of God, "blind amid enemies," and his own position in the alien society of the Restoration. Though lacking the poetic brilliancy and the variety of 'Paradise Lost,' 'Samson Agonistes,' by virtue of its moral and spiritual energy and its consummate art, makes a profound impression on the reader. More nearly than any other work in our literature it is the modern counterpart of The Book of Job. Consult the works on Milton listed under PARADISE LOST; also 'Samson Agonistes' (edited by Verity, A. W., 1892); and Jebb, R. C., 'Samson Agonistes and the Hellenic Drama.'

JAMES H. HANFORD.

SAMUEL, Hebrew judge and prophet about 1140 B.C., whose rule preceded the establishment of the kingly office. His name, in Hebrew "Shemuel," meaning "asked from," or "heard of God," is explained by his story as a child. He was the son of Elkanah, of Ramathaim-zophim, belonging to the tribe of Levi, by Hannah. Hannah had been barren previous to the birth of Samuel, but she prayed earnestly to the Lord for a man-child, and vowed that if her petition were granted she would consecrate the child to the Lord all his days. Her prayer being heard she took her son to Shiloh to surrender him to the high-priest to be trained to the service of the Lord. The boy grew up devoted to the temple service; but after the death of Eli nothing more is heard of Samuel for a space of about 20 years, while the Ark, restored by the Philistines, was in the house of Aminadab. He then exhorted the Israelites, when they were hard pressed by the Philistines, to abandon their idolatry, and to fear God and worship him, as their only means of deliverance. His prayers and sacrifices gained for them the victory at Mizpeh, and it is probable that from this time, and in consequence of the leading part Samuel then took, he obtained the name and authority of judge. It is recorded that he judged Israel all his life, going a yearly circuit from Ramah, where was his home, to Bethel, Gilgal and Mizpeh. At Ramah he built an altar to the Lord. His administration was distinguished by the restoration of the neglected worship of Jehovah. He also established schools of the prophets. In his old age the corruption of his sons, to whom he had transmitted the active duties of the office of judge, excited discontent among the Hebrews, who demanded a king. Samuel reluctantly yielded to this revolution, but at the same time anointed the king of the general choice. After the establishment of the monarchy Samuel still continued to be judge in matters affecting morals and religion, in addition to the exercise of his prophetic functions. In his bearing toward Saul Samuel conducted himself with wonderful dignity and kindliness. He earnestly desired that Saul, as king, should rule well in the fear of the Lord, and that his dynasty should be permanent. When Saul attacked the priestly office and privileges Samuel anointed a new king, David. He did not live to see the contest between David and Saul decided; but even after his death his spirit, evoked by the witch of Endor, threatened Saul with the divine vengeance. See SAMUEL, BOOKS OF.

SAMUEL, Books of. In the Hebrew Bible the two books of Samuel, like Kings, formed originally one book. The title is derived from the name of the prophet who appears as the principal character in the earlier part of the narrative and who played a most decisive part in the founding of the Hebrew monarchy.

The book seems to have been composed, in essentially its present form, shortly before the publication of the law of Deuteronomy in 621 B.C. After that event Samuel received some editorial revision and additions, but no such rigid framework, designed to teach the great lessons of Deuteronomy, as is seen in Judges and Kings. It thus belongs to the first great era of Hebrew historical writing, which began in the latter half of the 10th century B.C. and ended with the publication of Deuteronomy. The analysis of this book into its component documents has not been so satisfactorily worked out in detail as in the case of the narrative books of the Hexateuch, but there is no great difficulty in recognizing a general distinction between the older and younger elements, at least in the first part of the work. The earlier strand gives a vivid, natural account of the rise of the monarchy, with Samuel appearing as a local seer and leader of a religious-patriotic movement, eager to unite the Hebrew tribes in a struggle against their Philistine oppressors. In the later strand, Samuel figures as himself a recognized military leader and "Judge" of united Israel, who wins overwhelming victory in the struggle against Philistia and is at first opposed to the establishment of the kingship. The earlier picture shows the "king maker" as a really greater and nobler man than the later represents. From a relatively obscure position, with keen vision he recognizes in the unawakened giant who comes to consult him the possibilities of a king who shall unite and free the tribes, and he very skilfully sets in operation influences that make Saul's own action sure. In the later tradition, which took shape in Samuel's own tribe, the figure of the prophet has grown into that of one who holds a position of recognized leadership and authority, but it is no longer one who sees the real need of the time. Many scholars connect the earlier strand with the great Judean history that appears throughout the Hexateuch, and the later with the similar Ephraimite history. It seems more probable, however, that the later strand was written after the composition of the Ephraimite history, while the early stories of Samuel and Saul were composed before the Judean history of the Hexateuch. In the latter part of 1 Samuel and in 2 Samuel we do not have so clearly an inweaving of an earlier and later document, but it is possible to distinguish, to some extent, the younger and older elements. Recognition of the composite origin of the book relieves the obvious difficulty of the duplicate narratives that puzzle any attentive reader — the two introductions of David to Saul, the two origins of the saying con-

cerning Saul among the prophets, the two accounts of sparing Saul's life, etc. The analysis also brings into clear relief as a separate document the wonderful, dramatic story which, with some later elements, constitutes chaps. ix to xx of 2 Samuel.

The book as a whole attained substantially its present form earlier than any other of the historical books of Israel. In its completed form, it falls into five principal sections, due in part to the plan of the compiler and in part to the form in which the materials came to him: (1) Samuel and the establishment of the kingdom under Saul (1 Samuel i–xiv); (2) Saul and the rise of David (1 Samuel xv–xxxi); (3) the establishment of David as king (2 Samuel i–viii); (4) court and family life of David (2 Samuel ix–xx); (5) Appendix (2 Samuel xxi–xxiv). Some would treat (2) and (3) as one section — the summaries of the reigns of Saul and David introduced into 1 Samuel xiv and 2 Samuel viii would favor such division. In the opening chapters of the book the scenes lie in the days of the Judges, when the tribes of Israel are without political union or any common organization. The birth and boyhood of Samuel are recounted. The defeat of Israel by the Philistines with the capture, vicissitudes, and restoration of the Ark precede Samuel's judgeship and victory in battle against the Philistines. The circumstances leading to Saul's selection as king and his early victories are followed by the summary of his wars and a notice of his family. The second section opens with the rejection of Saul and the introduction of David to the history. It is occupied chiefly with Saul's growing jealousy and David's flight and outlaw life. Saul's last battle against the Philistines closes this section. The third division gives David's elegy over Saul and Jonathan, taken from a collection of national songs known as the Book of Jashar. The narrative goes on to record the steps by which David becomes king over all Israel, with the Philistines subdued and the Hebrew capital established at Jerusalem. The summary of David's victories and his court officers closes this section. The following division (2 Samuel ix–xx) tells the story of the birth of Solomon and the troubles in David's family that resulted in the deaths of older brothers, making room for Solomon's ascent to the throne. The conclusion of this dramatic narrative is not given in the book of Samuel, but forms the introduction of the book of Kings. The appendix contains two songs ascribed to David, one of which occurs also as the 18th Psalm, lists of David's heroes, and two very primitive stories of a famine and pestilence that occurred during his reign. Samuel thus contains a history of the transformation of a group of tribes into an organized state, commanding the respect of neighboring kingdoms and able to weather the storms of rebellion and civil war.

Viewing the book as literature, the early narrative of Saul's selection, beginning with chap. ix, the stories of his jealous struggle against the rising prestige of David, and the complex story of David's court and family life are to be noted as the earliest examples of connected prose in ancient Israel. As such they constitute the beginnings of genuine historical literature in the writings of the world. From these vivid narratives, committed to writing soon after the events had occurred, the writers of Judah and Israel later went on to compose the story of the earlier past. In power to select the significant points that make character and event living and intelligible, these early narratives are unexcelled in prose literature. The religious and moral conditions recorded show many primitive traits, yet the narratives are characterized by a devotion to the God of justice, who cares for right conduct among men, that makes them perennial sources of moral and religious inspiration.

HENRY THATCHER FOWLER,
Professor Emeritus of Biblical Literature and History, Brown University.

SAMURAI, the feudal warriors of Japan, who, prior to the revolution of 1867–68, comprised about one sixteenth of the population (see JAPAN) and are now represented by the *shizoku,* or knights. They were distinguished by indomitable courage, their marvelous feats of arms, fervent patriotism, intense loyalty and a strong antipathy to foreigners, which was in marked contrast to the hospitable and courteous demeanor of the mass of the population. They were the military retainers of some 276 daimios or feudal chieftains, the more powerful among whom were those of the southern clans Satsuma, Choshiu, Tosa and Hizen. After the reopening of foreign relations due to United States initiative in 1854, the enlightened Japanese discovered at once that to place themselves commercially and politically on a level with the progressive nations of the world they had to adopt Occidental methods and the prominent chiefs and their samurai were the first to advocate the suppression of the Tokugawa shogun, the supremacy of the mikado, the surrender of feudal powers, and a reorganized administration for the building up of a constitutional monarchy, most of which was effected by the revolution of 1868.

The samurai expected that the military and naval services would be exclusively reserved for them and their descendants. The radical measures adopted in 1871, however, led to the total abolition of feudalism and the absorption of the samurai into the mass of the people, in many cases with a praiseworthy self-abnegation, but in others not without serious opposition. That of the famous Saigo of Satsuma, hitherto one of the most prominent reformers, culminated in the civil war of 1877 and the total defeat of the samurai and their pretensions. See JAPAN.

SAMVAT, a method of reckoning time in India, generally used except in Bengal. Chris-

tian dates are reduced to Samvat by adding 57 to the Christian year.

SAN ANDREAS, săn' ăn-drā'ăs, **RIFT,** a zone of faults in the earth's crust extending along the coast of California. The northern extremity of the rift is in Humboldt County near Cape Mendocino. For a distance of about 75 miles to the coast a few miles north of Cape Arena the rift is offshore; thence it continues on land, passes through the San Francisco peninsula, and curves off to the southeast into the desert region of southern California. The total length of the reef is about 570 miles. The California earthquake of 1906 which caused so much damage to San Francisco was partly due to a dislocation of the earth's crust along a portion of the San Andreas Rift.

SAN ANGELO, ăn'jĕ-lō, Texas, city and seat of Tom Green County; alt. 1,847 feet; on the Concho River; 77 miles southwest of Abilene; on the Santa Fe Railroad. The town is one of the largest primary wool markets in America and has mohair markets, cottonseed, dairy and petroleum products, sheet metal, stove and saddlery plants. It is a large oil distributing center. Although there was an army camp and small settlement here previously, the town was not firmly established until 1882. Cattle trails and stage lines passed through here and the coming of the railroad in 1888 accelerated the growth of the town's importance as a shipping and supply center. Pop. (1950) 51,889.

SAN ANTONIO, ăn-tō'nĭ-ō, Texas, seat of Bexar County (pronounced bâr), aerial port of entry, and the commercial, financial, cultural, and recreational center of a vast south central Texas area comprising 90 counties. Here the early development of Texas centered. The area still reflects many aspects of its historic Spanish civilization along with that of modern America.

Geography.—San Antonio, at an altitude of approximately 650 feet, is situated about 140 miles from the Gulf of Mexico and about equidistant from the United States-Mexico border at Laredo. It is on the San Antonio River, a nonnavigable stream which winds for miles through the city. The fertile San Antonio Valley, with its rolling terrain to the north and flat, productive, tillable land to the south, affords an excellent water supply obtained from deep artesian wells. The climate is mild and relatively even. The average temperature over a period of years has been: winter, 59.5°F.; summer, 78.7°F.; annual mean, 69.1°F.; with average annual precipitation of 27.39 inches and average humidity of about 54 per cent. There is an average daily temperature variation of 20° with cool Gulf breezes each summer night. The climate is one of San Antonio's major assets and has been a factor, along with the natural resources of the region, in its rapid development since the latter part of the 19th century.

Population and Area.—Over a period of 100 years the population of San Antonio shows the following growth: 1850, 3,488; 1880, 20,550; 1900, 53,231; 1920, 161,379; 1940, 253,854; 1950, 408,442. About 33⅓ per cent of the population is of Latin-American descent, while the next largest group of foreign extraction is German. In 1950 the Negro population was approximately 7 per cent of the total. The city covers 69.4 square miles, while the county covers 1,247 and has a population of 500,460. With few exceptions, the suburbanites earn their livelihood in San Antonio proper.

Government.—San Antonio has the commission type of government, adopted in 1914, with a mayor as the chief executive officer, while the various departments are headed by individual commissioners. Along with the rapid growth of the city, many public improvements have been made. Oil and gas are used almost exclusively for fuel, which aids in keeping the city relatively clean. Both the city public service board, which furnishes gas and electricity, and the city water board are municipally owned. The government welfare program is supplemented by the welfare activities of numerous religious, fraternal, and other organizations. Backed by a progressive city health department, San Antonio's health facilities include a number of modern hospitals.

Industries and Business.—San Antonio is historically the center of trade for the vast south Texas area and is the natural commercial gateway to Mexico from the United States, having Foreign Trade Zone No. 6 located at the municipal airport. This is the first foreign trade zone in the nation to be located inland, served by air, rail, and highway, and operated by private capital.

San Antonio is one of the largest produce exchange markets and one of the leading livestock centers in the United States. Twenty-five per cent of the wool and 85 per cent of the mohair produced in the country are grown just west of San Antonio. In addition to being in the midst of a rich and extensive ranching and farming area, San Antonio is the headquarters for the south Texas petroleum-producing district.

The wholesale and retail trade serves 149 and 90 counties respectively. Main industries include meat packing, coffee roasting, pecan shelling, brewing, and the manufacture of iron and steel products, condiments, soap, candy, cottonseed products, batteries, cement, flour, feed, clothing, sashes and doors, and food. The economic strength of the community lies in the wide diversity of products manufactured, ranching and farming activities, military payrolls, and retail, wholesale, and service trade, all of which sustain employment and commercial activity.

Transportation and Communication.—San Antonio is on three trunkline railroads and a network of modern state and federal highways with motorbus and truck transportation radiating in all directions. It has a municipal airport with airline service available to all corners of the world. It is the home of the Slick Airways, Inc., in 1950 the largest air-freight carrier in the United States. Transportation facilities place the city within easy reach of the deep seaports of Corpus Christi, Houston, and Galveston. The San Antonio Transit Company provides all intracity public transportation by modern, air-conditioned buses. A new multimillion dollar Urban Expressway facilitates traffic to all parts of the city.

Educational, Cultural, and Recreational Facilities.—In 1950 the public school system represented an investment in excess of 17 million dollars and had a total of 62 schools. Of these, 46 were elementary, 10 junior, and 6 senior schools. Seven members constitute the board of the San Antonio Independent School District and

all are elected to office. All senior schools offer college preparatory courses. The San Antonio Vocational and Technical High School offers complete courses in technical training with both day and night classes.

In addition to the public school system, there are numerous nationally known private schools such as Texas Military Institute, St. Mary's Hall, Peacock Military Academy, Ursuline Academy, and San Antonio Academy. There are five institutions of higher learning located in San Antonio: namely, St. Mary's University (1852); Trinity University (1869; moved from Waxahachie in 1942); Incarnate Word College (1881); Our Lady of the Lake College (1912); and the San Antonio College (1925).

The San Antonio Public Library, which has the largest collection of Circusana in existence, has branch libraries conveniently located throughout the city. In addition should be mentioned St. Mary's University Downtown Law Library, and the Bexar County Medical Library.

From the earliest days of its history, San Antonio has been the cultural center of southwest Texas. The San Antonio Symphony Orchestra is recognized as one of the leading symphonies in the nation. The opera season, under the auspices of the San Antonio Symphony Society, offers famous operas with internationally known stars.

The River Art Show, sponsored by the San Antonio River Art Group, is held in April of each year during the Fiesta de San Jacinto celebration on the banks of the San Antonio River in the downtown section of the city. The Pan-American Art Galleries, Witte Memorial Museum, and the River Art Group all maintain permanent galleries.

San Antonio is commonly called the Fiesta City. Entertainment of all kinds, from opera to rodeos, abounds the year round. The Municipal Auditorium, which seats 6,000, and the ultra-modern Bexar County Coliseum, having 7,500 permanent seats, are the center of entertainment activities. In the latter, the San Antonio Livestock Exposition is held in February of each year. This is a 10-day event, offering top rodeo shows daily, livestock exhibits, and commercial displays dealing with the ranching and farming industry. Alamo Stadium and adjacent Alamo Stadium Gymnasium, carved in their natural setting and built from native stone, offer a stream of sports events to the community.

The Fiesta de San Jacinto, a week-long celebration that takes place annually during the week in which April 21 falls, is a period of fun and entertainment comparable to the New Orleans Mardi Gras. Staged as a tribute to the memory of the heroes who won Texas her independence, the brilliant spectacle is by turns solemn and festive, and throughout the week there runs a curious blending of old Spain with the old West, and present-day Latin America with life in a busy North American city. Dark-eyed senoritas with mantillas, and debutantes in the height of modern fashion; cowboy boots and dancing slippers; covered wagons and princely thrones; hillbilly bands and symphony orchestras—all have their roles in this great Southwest pageant.

Special Points of Interest.—Few cities in the United States can compare with San Antonio's points of interest for the visitor. Even modern-day San Antonio reflects the stirring history of the Alamo City. People the world over have studied or read about the famous Alamo, the Mission San José known as "Queen of the Missions," Mission Concepcion, Mission San Francisco de la Espada, and Mission San Juan Capistrano. To these points should be added such sights as the Arneson River Theatre (built on the San Antonio River in the downtown section, with stage separated from the natural grass seats by the river); the Cos House (home of Gen. Martín Perfecto de Cos, early governor); La Villita, meaning "Little Town" (a restoration and reproduction of some of San Antonio's earliest dwellings); the Spanish Governor's Palace (originally used by the Spanish governors of Texas as an office and residence); the Francisco Ruiz House; Buckhorn Curio Shop (site of many frontier gun battles); Brackenridge Park (327 acres), having within its boundaries a golf course, tennis courts, polo field, Witte Memorial Museum, the Pioneer Log Cabin, Pioneer Memorial Hall, Reptile Garden, large, modern Zoological Garden, Japanese Sunken Gardens, and the Sunken Garden Theatre.

The beautified section of the San Antonio River, which winds its way through the entire downtown district is, in itself, a special point of interest to the visitor. One can walk along the river bank or ride in the gondolas that cruise through the business section.

From its earliest days, San Antonio has been a military center. Here are located such important military installations as Fort Sam Houston (1865), and Randolph, Kelly, Brooks, and Lackland Air Force bases. Each is a city within itself. Many of the United States' great military leaders have returned to San Antonio to live in retirement.

History.—The earliest history of San Antonio is found in the records of Álvar Núñez Cabeza de Vaca (1490?–?1557), recounting his visit to the vicinity now known as La Villita. While the earliest construction in Villita, about 1722, comprised homes for the Spanish soldiers and their Indian wives, from before 1500 it had been the village of Cohuiltecan Indians.

Since the time, two hundred years ago, when Spain and France warred for the possession of the fertile lands surrounding San Antonio, the city has been an important military post. The towering buildings of modern San Antonio stand on ground where much of the stirring history of the Southwest was made. The tread of marching men, the gleam of arms in the bright sun are not new sights to the Alamo City. Near the end of the 17th century, French traders developed the route now known as the San Antonio Road, which leads westward from Nacogdoches through San Antonio. It was at this time that the Spanish Franciscan friars began to bring the Cross of civilization into this savage territory. In 1691, at the Indian village called Yanaguana, Father Damien Massanet erected a Cross and rechristened the place San Antonio. The year 1718 was marked by the official establishment of the Mission San Antonio de Valero (later known as the Alamo). Shortly afterward, a few miles away, an imposing structure, Mission San José, was built with Indian labor and under the supervision of the padres. In 1730, the three missions of San Francisco de la Espada, San Juan Capistrano, and Concepcion de Acuna, which originally had been established in East Texas, were reestablished in San Antonio. San Antonio proper was first settled in 1731 by 15 Spanish families

sent from the Canary Islands by the king of Spain. The settlement was named San Fernando de Bexar (originally spelled Bejar), with the governmental headquarters (or offices) housed in a pretentious adobe building, the Governor's Palace, which still stands.

For one hundred years, the royal emissaries from Spain ruled over the section. Hardship became their heritage. The fierce Lipan and Comanche Indians took heavy toll in life and property. Then the power of Spain began to wane, and when the Mexican revolt for independence flared up in 1821, the Spaniards were defeated and San Antonio came under the direct rule of Mexico. Mexico City was hundreds of miles away and Mexico was torn with civil strife. The central government had little time to waste on Texas, so the governing officials at San Antonio ruled as they wished, and wisdom and justice were seldom attributes to these petty despots.

From the East and North began to come English-speaking families. These tall, hardy pioneers in their buckskin shirts and deerskin leggings, were not men to accept injustice placidly. As more Anglo-American settlers came, resentment against the tyranny of the Mexican government grew. As early as 1835, the flames of war broke out, and San Antonio became the scene of armed revolt. In December 1835, Ben Milam and a courageous group of followers took the city from the Mexican general, Martín Perfecto de Cos. This revolt brought all Texas up in arms.

The self-styled "Napoleon of the West," Antonio López de Santa Anna, president and dictator of Mexico, thinking to put an early end to the Texas unrest, sent an army of about 4,000, under the command of Gen. José Urrea, against a small group of American colonists at Goliad (March 1836). The defenders, after surrendering as prisoners of war, were all put to death.

Meanwhile, Santa Anna, commanding in person an army of more than 4,000, concentrated at San Antonio in February. Col. William B. Travis was holding the city with somewhat over 180 men. The Texans fell back into the Alamo (q.v.) and prepared to write in blood an immortal story of bravery and sacrifice. Santa Anna demanded unconditional surrender. A shot from a small cannon within the walls was the answer, and the Lone Star flag was run up from the roof of the hastily improvised fort. For 12 days the gallant defenders of the Alamo withstood the Mexican assault. But on March 6, 1836, the attackers gained entrance, and in the last fierce hand-to-hand struggle every one of the Texans died fighting. Their bodies were piled in front of the Alamo and burned. And the flame which lighted that pyre ignited all Texas, for the fall of the Alamo welded the scattered Texans into a united people. On April 21, 1836, Gen. Sam Houston led an army of Texans against Santa Anna at San Jacinto. The small force smashed into the Mexican general's fine army crying, "Remember the Alamo! Remember Goliad!" and completely routed the army, taking Santa Anna himself prisoner.

After winning independence, the Lone Star State became a nation in its own right. Later, answering the call of blood, the Texans voted to join the Union and Texas became in 1845 a part of the United States. Over San Antonio have flown six proud flags—those of Spain, France, Mexico, the Republic of Texas, the Confederate States of America, and the United States.

With its heritage of romance and grandeur, merged with the sparkling newness of the 20th century, San Antonio stands today one of the great cities of America.

Research Director, San Antonio Chamber of Commerce.

SAN ANTONIO, a river in Texas, which rises in Bexar County. It is formed by the confluence of the Medina River and Leon Creek. It flows east through Wilson, Karnes, and Goliad counties, a distance of about 200 miles and enters San Antonio Bay, an inlet of the Gulf of Mexico.

SAN ANTONIO DE LOS BANOS, sän än-tō'nyô dā lôz vä'nyôs, Cuba, municipality and town in La Habana Province, 20 miles southwest of Havana. Situated on the Ariguanabo River, the town has mineral springs and baths which make it a summer resort for the residents of Havana. In the immediate vicinity of the town is the Vuelta Abajo region, famous for its tobacco. The town was founded in the middle of the 18th century as a camp for Mexican convicts. Early in the 19th century, coffee estates were established here, but later tobacco became the chief product. Population (1943) 14,456.

SAN BENITO, săn bĕ-nē'tō, Texas, a city in Cameron County; altitude 35 feet; 18 miles northwest of Brownsville on the Missouri Pacific Railroad. It is the trade center of an agricultural region producing citrus fruits and vegetables. Because of its close proximity to the Mexican border and the Gulf of Mexico, it is a center for recreation. The city was founded in 1908 and incorporated in 1910. Population (1940) 9,501; (1950) 13,271.

SAN BERNARDINO, bûr-nĕr-dē'nō, Calif., city and seat of San Bernardino County; altitude 1,054 feet; 58 miles east of Los Angeles; on the Union Pacific, Southern Pacific, and Santa Fe railroads. It is located in a region where citrus fruit is extensively grown and it is a shipping point for fruit, grain, and lumber. Here are railroad shops, foundries, cement and color printing plants, refrigerator car, dress, wine, dairy product and plumbing material industries. Nearby are deposits of silver, potash, borax, and cement. San Bernardino Valley College is located here, and there are an unusually large number of churches of many denominations. Promoting musical interests in the city is the San Bernardino Valley Concert Association. The National Orange Show, held annually since 1915, has permanent exposition buildings. To the northeast of the city is San Bernardino National Forest. The original settlement was named when missionaries entered the valley, in 1810, on the feast day of San Bernardino of Siena. A Mormon colony settled here in 1851 but these settlers were recalled to Utah by Brigham Young in 1857. San Bernardino was incorporated as a city in 1886. Pop. (1950) 63,058.

SAN BERNARDINO, (1) a range of mountains in the southwestern part of California. Although by some considered one of the Coast Ranges, they are more properly thought of as a continuation of the Sierra Nevada.

(2) A peak of the San Bernardino Mountains. Its height (10,630 feet) is exceeded by San Gorgonio (11,485) six miles to the east.

SAN BERNARDINO, a strait of the Philippines between the extreme southeastern point of Luzon and northwestern Samar, about 27 miles long and 5 miles wide. Together with the Sibuyan Sea and the Verde Island Passage, it forms the main channel for ships from the United States and the Pacific to Manila and the South China Sea. Near the great rock was fought an important naval battle in October 1944.

SAN BLAS, blăs, **Isthmus of,** the narrowest section of the Isthmus of Panama, between the Gulf of San Blas on the north and the Bay of Panama on the south. It is about 31 miles wide. The Cordillera de San Blas lies across this area from east to west. Along the northern coast of the isthmus is a part of the San Blas Archipelago, which in inhabited by the primitive Cuna or San Blas Indians.

SAN BUENAVENTURA. See VENTURA, Calif.

SAN CARLOS, säng kär'lôs, Chile, town in the Province of Ñuble, in the south central part of the country, on the main railroad of Chile, 15 miles northeast of Chillán. Pop. (1940) 9,411.

SAN CARLOS, Philippines, municipality, Province of Pangasinan, Luzon, on a tributary of the Agno River, and on the Manila-Dagupan Railroad, 10 miles southeast of Lingayen. It is the center of a fertile agricultural region. Pop. (1939) 47,334.

SAN CRISTOBAL, krês-tō'bäl (in full SAN CRISTÓBAL DE LAS CASAS; commonly called LAS CASAS), Mexico, city of the State of Chiapas, about 40 miles east of the capital, Tuxtla Gutiérrez. It occupies a high (7,000 feet), fertile, and beautiful valley on the eastern slope of the central mountain range. It is the see of an archbishop and has a cathedral, several convents, a university, a grammar school, a hospital, and a handsome capitol. It has an active trade, especially in coffee; it also has manufactures of earthernware and coarse textiles. The chief occupation, however, is the raising of cattle, horses, mules, and swine. The town was founded in 1538 on the site of the ancient Zacatlan, and named in honor of the celebrated Bishop Bartolomé de Las Casas who lived there. Pop. (1940) 11,768.

SAN CRISTOBAL (also known as CHATHAM ISLAND), one of the Galápagos Islands, in the Pacific Ocean. The administrative center of the Galápagos Islands, San Cristobal, is located there. Sugar cane and coffee are grown.

SAN DIEGO, săn dĭ-ā'gō, Calif., city, port of entry, and San Diego County seat; altitude sea level to 822 feet; on San Diego Bay, an arm of the Pacific Ocean, and on the San Diego River which flows into Mission Bay, to the north; 125 miles south of Los Angeles and about 12 miles north of the Mexican border. It is served by the Atchison, Topeka and Santa Fe and Arizona Eastern railroads; has a municipal airport (Lindbergh Field), transcontinental air service, and steamship service to domestic and foreign ports. San Diego is the oldest Spanish settlement in California and still reflects in numerous ways the easygoing spirit of the mission era. The business section is modern, but within it are numerous structures reminiscent of the last decades of the 19th century. On the northeastern edge of the business district is Balboa Park, around which the residential section has been built up. To the west is Middletown, a narrow strip of land between the bay and the low hills, where live many Italian fishermen and employees of the airplane factories. Northwest of Middletown is Old Town, site of the original Spanish settlement. In the Logan Heights district, south and east of the business district, are small Mexican and Negro communities, and on the bay side of Point Loma is a colony of Portuguese fishermen.

San Diego Bay, landlocked, and safe at all seasons, is one of the ten great natural harbors of the world. It is 12 miles long, one to three miles wide, and has an area of 22 square miles, with 40 feet of water over the bar at low tide. San Diego is the headquarters of the 11th Naval District, and the site of one of the country's most important naval bases. It is also the site of a naval training station, a Marine Corps base, naval air station, destroyer base, Coast Guard base, naval hospital, naval supply depot, naval radio station, and other naval establishments. San Diego is a training center for navy pilots, and a trial ground for land and sea planes.

Industries.—The largest and most important industry of San Diego is aircraft construction. Here are located the plants of the Consolidated Vultee Aircraft Corporation, the Ryan Aeronautical Company, the Solar, Rohr, and other concerns making planes or parts. Other leading industries include fishing and fish packing, boat building, sheet metal work, brewing, etc.

Cultural Activities.—San Diego has an excellent system of public, private, and parochial schools, and is the site of San Diego State College, and Brown Military Academy, while at Carlsbad-by-the-Sea, 35 miles away, is the San Diego Army and Navy Academy. Libraries include the San Diego Public, with 13 branches and 8 stations; the San Diego County, San Diego Scientific, San Diego Law and the San Diego Metaphysical libraries. A fine arts gallery is located in Balboa Park, as is also the Spanish Village Art center, and there is an art center in La Jolla. Musical organizations include the Amphion Club, which gives six concerts during the winter months; the Civic Symphony Orchestra which conducts the Midsummer Nights' Symphonies during the summer in Balboa Park; and the Philharmonic Society, which presents the Los Angeles Symphony Orchestra in a series of six concerts during the winter, while band concerts are given every week by various organizations, including bands of the Naval Training Station and other service organizations.

Parks.—There are in San Diego 27 parks with a combined area of 2,350 acres. The largest is famous Balboa Park, 1,400 acres, located in the heart of the city, and noted for its semi-tropical trees and plants; its zoo containing many rare specimens; and the great Spreckels open-air

organ. Many buildings in the park house cultural exhibits. Near San Diego are seven state parks, one private park, Cabrillo National Monument and Cleveland National Forest. In Palomar Mountain State Park, 68 miles away, is the Palomar Observatory of the California Institute of Technology, famous especially for its 200-inch telescope, by far the largest in the world. The city offers many attractions to tourists, including salt and fresh water fishing, swimming, golf, tennis, and yachting. In addition to the places mentioned, points of interest include La Jolla, Coronado Islands, Tijuana in old Mexico, Warner's Hot Springs, Pacific Beach, Mission Beach, Carlsbad, Ramona's Marriage Place, Fort Stockton, Casa Bandini, and numerous other places.

History.—San Diego was discovered Sept. 28, 1542 by Juan Rodríguez Cabrillo, a Portuguese navigator sailing in the employ of Spain. Sixty years later (Nov. 10, 1602) it was given its present name by Sebastián Viscaíno in honor of San Diego de Alcala, a Spanish saint. San Diego Mission, first in the California chain, was dedicated July 16, 1769 by Fra Junípero Serra. The first non-Spanish ship to enter San Diego Bay was the *Discoverer,* commanded by Capt. George Vancouver, a British explorer. Its arrival in November 1793, resulted in the construction by the Spaniards of Fort Guijarros on Ballast Point. Following Mexico's successful revolt against Spain, San Diego was made the capital of California in October 1825, when the first duly appointed Mexican governor arrived. The war between the United States and Mexico brought American troops into California in 1846. Maj. John C. Frémont, United States Army, and his California Battalion, 166 men, arrived at San Diego July 29, 1846 aboard the U. S. sloop-of-war *Cyane,* commanded by Samuel du Pont. Shortly afterward Frémont marched away to take Los Angeles while Commander du Pont ordered the United States flag raised in the San Diego Plaza. In November 1846 Commodore Robert F. Stockton, commanding the U.S.S. *Congress,* arrived at San Diego and retook the town which had been captured by the California Rangers. The commodore improved the fort and renamed it Fort Stockton. In the meantime, Gen. Stephen W. Kearny, United States Army, with Kit Carson as guide, was making his famous march from Fort Leavenworth, Kans., to California. At Warner's, early in December, he was told by a San Diego party that the Rangers were near by. Kearny, however, ordered his command to proceed. At San Pasqual he was met by a force under Gen. Andres Pico and defeated, Dec. 6, 1846. However, he finally reached San Diego on December 12, and from that time on the city has been an American community. San Diego was incorporated as a city March 27, 1850. Pop. (1940) 203,341; (1950) 334,387.

Consult Smythe, W. E., *History of San Diego* (San Diego 1907).

SAN DOMINGO, săn′ dô-mĭng′gō. See Santo Domingo.

SAN FELIPE, săm fâ-lē′pâ, Chile, an agricultural town and capital of the province of Aconcagua, about 48 miles north of Santiago, in the fertile valley of Aconcagua. It is an interesting, regularly built town, with an attractive central square and highly improved boulevards. It was founded in 1740. Pop. (1940) 13,168.

SAN FELIPE INDIANS, săn fâ-lē′pâ, a Pueblo tribe of New Mexico. See Keresan.

SAN FERNANDO, Philippines: (1) municipality, province of Cebu, on the east coast, 17 miles southwest of the city of Cebu, the provincial capital. Pop. (1939) 17,562.

(2) municipality, capital of the province of Pampanga, central Luzon, on the Manila-Dagupan Railroad, 35 miles northwest of Manila. It is the railroad shipping point for Bacolor, with which it is connected by highway, and is an important center of the sugar industry, containing sugar mills and warehouses. It is also the center of extensive rice cultivation. During World War II it was recaptured by the Americans Jan. 29-30, 1945. Pop. (1939) 35,662.

(3) municipality, capital of the province of La Union, northwest Luzon, on San Fernando Bay, 45 miles north of Dagupan. It is on the coast highway and also on the Manila-Dagupan Railroad. It also has frequent communication with Manila by sea. Fishing is an important industry. Pop. (1939) 23,366.

There are three smaller towns of the same name: pueblo, province Ambos Camarines, Luzon; pueblo, Ticao Island, province of Masbate; pueblo, province of Zambales, Luzon.

SAN FERNANDO, Spain, seaport on the Isla de León, 7 miles southeast of Cádiz, in the province of Cádiz. It is a fortified town now built in modern style. There are two churches, two hospitals, a naval academy and workshops, an extensive arsenal, a fine observatory (the southernmost of Europe), and an iron foundry. It has numerous domestic industries and a brisk trade in salt. At one time it was probably a Carthaginian settlement. The arsenal was built in 1790. Formerly known as Isla de León, the town received its present name in 1810. Pop. (1940) 38,581.

SAN FRANCISCO, frăn-sĭs′kō, Calif., city, port, and port of entry. Almost surrounded by water, enthroned on hills, San Francisco is spread over the tip of a peninsula with elevations ranging from below sea level to 933.6 feet (U.S. Base). A city of brilliance and charm, strategically centered on the Pacific coast, it is the heart of the vast central empire of California—one of the richest and most diversified—and a great seaport on one of the finest landlocked harbors in the world. Internationally recognized as the financial, commercial, industrial, and management center of the Pacific Coast region, San Francisco is a major supply base and distribution center for the agricultural, manufacturing, and mining industries of the area. It is also one of the nation's important cultural centers for music, art, and higher education, and one of the two greatest communication centers between the United States and the rest of the world. Traditionally a shipping center of world renown, its trade doors open to global highways where streams of commerce have coursed for centuries, linking San Francisco with the great cities of Europe and Asia.

Geography.—San Francisco is surrounded on three sides by the waters of the sea: the Pacific Ocean on the west; the Golden Gate on the north; and the San Francisco Bay (q.v.) on the east. It is joined with the East Bay communities by the San Francisco-Oakland Bridge, and with

the Marin Peninsula to the north by the Golden Gate Bridge. To the south it merges with the San Francisco Peninsula communities, which are connected by four major highways—Bayshore Highway (U.S. 101), El Comino Real (the King's Highway), Skyline Boulevard, and Ocean Shore Highway. Much of the present city easterly of Kearny and 3d streets rests on man-made land.

Behind the Golden Gate at half tide are 456 square miles of bay. San Francisco Bay proper comprises 262.7 square miles, San Pablo Bay 106.8 square miles, Suisun Bay 47.9 square miles, and other miscellaneous areas 38.6 square miles. San Francisco's east boundary and the west boundary of Oakland, Berkeley, Richmond, and Albany are common to each other and meet in the waters of the bay. In all, 12 contiguous central cities with a population of 1,521,923 (1950) are linked together in a chainlike manner around the shores of San Francisco Bay.

Within a 50-mile radius of San Francisco are 61 incorporated communities: on the San Francisco Peninsula there are 21, the four largest being San Jose, San Mateo, Palo Alto, and Burlingame; in the East Bay area, 20, led in size by Oakland, Berkeley, Richmond, and Alameda; and in the North Bay area, 20, including Vallejo, Santa Rosa, San Rafael, and Napa.

Sections of the City.—San Francisco's waterfronts, hills, variable climatic conditions, people, and periods of expansion have tended to create a number of sections within the city. Master planning instituted since World War II has resulted in more unified development. Following are the major sections of the city. Market Street runs through it diagonally southwest to Twin Peaks. The section north of Market Street from the bay to Van Ness Avenue contains some of the earliest historical landmarks; the downtown business and financial district; the hotel, theater, and shopping district centering around Union Square; the apartment house district; Nob Hill, Telegraph Hill, Russian Hill, Chinatown, the Italian quarters; a large section of the waterfront bordering the Embarcadero; the commission district and some manufacturing.

The Western addition lies north of Market Street between Van Ness Avenue and Arguello Boulevard and is chiefly residential, including Pacific Heights, Marina, and Fillmore districts.

The Richmond section with the contiguous Sea Cliff area lies between the Presidio and the Golden Gate Park and extends from Arguello to the ocean. It is one of the older residential areas and comprises many substantial homes and some newly developed tracts. It includes the Geary and Clement streets shopping districts.

South of Golden Gate Park to Sloat Boulevard and west of Twin Peaks to the ocean is the expansive Sunset District. Many of the city's newest single-family homes are in this area.

South of the Sunset area to the city's south boundary is the Lake Merced district which includes many of the newer residential developments—Park Merced, Lakeside, Stonestown villages, and the newest business districts.

Westerly of Twin Peaks sloping down to the Lake Merced section are Forest Hills, West Portola, St. Francis Wood, and Ingleside districts, principally residential areas.

South of Market Street, extending to the city's south line, between the bay and Mission Street are the Potrero and Bay View sections—the principal industrial areas of the city but also containing many homes and several large public housing projects and the San Francisco Naval Shipyard.

South of Market Street between the Potrero district and Twin Peaks is the Mission section, a warm sheltered area, where occurred some of the city's earliest developments including the establishment of Mission Dolores. The Mission business district is second largest.

A certain degree of self-sufficiency exists in most of the sections throughout the city but there are strong ties with the downtown district. The many steep streets offer no obstacle to heavy traffic. Two important cable car thoroughfares are Powell Street with a 17 per cent maximum grade, and California Street, with a 16 per cent maximum. The city engineer lists 23 streets with grades over 20 per cent.

Islands in San Francisco.—Alcatraz Island (q.v.), lying off the north side of San Francisco Peninsula in San Francisco Bay and resembling a huge battleship, is known as "The Rock" to the nation's underworld. From 1858 it was used as a disciplinary barracks for military prisoners. In 1933 it became a federal penitentiary. It has a capacity of 800 persons and has housed many of the country's most notorious criminals.

Yerba Buena Island, one of the connecting links in the San Francisco-Oakland Bay Bridge, has been in the government's possession since 1866 and in 1898 became a naval training station. First known as Wood Island, it then became Yerba Buena, then was officially named Goat Island, and finally in 1931 was officially designated by the United States Geological Board as Yerba Buena Island.

Treasure Island, connected with Yerba Buena by a causeway, was created as the site of the Golden Gate International Exposition (1939–1940), and is now occupied as a United States naval training base.

The Farallon Islands, comprising two separate groups approximately eight miles apart and about 35 miles west of San Francisco in the Pacific Ocean have been included since 1872 in the city and county of San Francisco. The only occupants are the United States Light House Service people and the operators of the Radio Beam Compass Station. Since 1855 the islands have been closed to the public.

Climate.—San Francisco is one of the few nature air-conditioned cities with a clean, fresh, bracing, climate—relatively warm in winter and cool in summer. Longtime records of the Weather Bureau report daily mean maximum temperature of 62.6°F. and daily mean minimum temperature of 50.4°. The annual monthly mean temperature is 56.5°; the coldest month, January, averages 50.1°, and September, the warmest, averages 61.5°. The rainfall averages 22 inches annually and occurs principally from November through April, with less than an inch in October and May, and only a trace in the months of June, July, August, and September. The sun shines in San Francisco 66 out of every possible 100 hours, with June the brightest, rising to 76 out of every possible 100 hours.

San Francisco's topography and location at the tip of a peninsula, beside the inlet between the ocean and the great valleys of California, have an important influence on the variable climates found in the different sections of the city. Due to the prevailing air currents, the hours of fog, which are frequent in July and August in

some sections of the city, rarely occur in other sections. The Lighthouse Service records reveal that the hours of fog on San Francisco Bay average only 153 out of the 8,760 hours which are in a year.

Area and Population.—San Francisco city and county are coextensive, containing 93.1 square miles, but more than half of this area includes a part of San Francisco Bay. The land area of the city alone comprises 44.82 square miles. The compact land area with tide lands fully reclaimed are planned as follows: residential—33.5 per cent; industrial—10.1 per cent; commercial—4.8 per cent; educational—2.1 per cent; recreational—12.2 per cent; institutional—1.8 per cent; military reserves—6.2 per cent; streets—25.3 per cent; utility and water lands—3.3 per cent; vacant—0.7 per cent.

In 1950, the population of San Francisco was 775,357. The number of people who come to San Francisco on business and pleasure increases the average daily population by about 200,000. The San Francisco metropolitan area, as defined by the United States Bureau of the Census, comprises Alameda, Contra Costa, Marin, San Mateo, Solano, and San Francisco counties. The population of this area in 1950 was 2,240,767.

The residents of San Francisco form one of the most democratic and cosmopolitan groups of people in the world. Every state and more than 34 foreign countries have shared their sons and daughters with San Francisco. The population of the city includes people from almost every section of the civilized world. About one third of the population is between 20 and 40 years of age.

Industry and Business.—San Francisco is a prominent production and buying center, a distribution center, and one of the nation's major supply bases. It is well equipped for exchange of goods and services and two-way trade. It is the financial and insurance capital of the West. It is headquarters of one of the world's largest banks (Bank of America) and of seven of the nation's largest banks; also headquarters of the Twelfth Federal Reserve District and the Federal Reserve Bank of San Francisco, and the nation's second largest security market. The expeditious handling of financial transactions has contributed greatly to the sound industrial and trade relations in the West.

Long a dominant port on the Pacific coast in world trade, many products of the regional West are assembled and processed here for world markets.

In May 1950, about 471,000 people were employed in San Francisco, including those living outside San Francisco in the metropolitan area. The rank of the major industry groups, based on number of employees, was: service, retail trade, manufacturing, wholesale trade, transportation, finance, government, construction, and some agricultural and mining groups, though often only the head offices of these last two groups.

As of 1947, there were 3,671 establishments in the San Francisco metropolitan area turning out products of one kind or another. More than half of these establishments were in San Francisco itself. That year the area used an average total of 163,641 employees in these establishments, of whom more than 131,000 were production workers. The United States Census of Manufactures for 1947 showed that the value added by manufacture by the 3,671 establishments in the metropolitan area amounted to $1,049,490,000, placing this area 10th in rank among all the manufacturing areas of the United States. In the five following industries the value added by manufacture was greatest: food and kindred products ($244,184,000), chemicals and allied products ($118,601,000), transportation equipment ($98,062,000), printing and publishing ($97,102,000), and fabricated metal products ($87,181,000).

Transportation and Communication.—San Francisco's excellent transportation and communication facilities focused on the Pacific coast make it one of the foremost centers of distribution in the nation. Converging here is a vast transportation network of transcontinental railroad lines, air transport services, steamship lines, highways, bus and truck lines.

Four mainline railroads serve San Francisco direct. These railroads by means of seven major transcontinental routes and connecting routes provide fast dependable service which is available to all parts of the United States, Canada, and Mexico. San Francisco's waterfront is state-owned and operated, and the piers and many industries north of Market Street are connected with the mainline railroads by the State Belt Railroad, operating along the waterfront.

Store-door pickups and delivery service for less than carload traffic is offered between San Francisco and practically all points in California and neighboring states. Overnight delivery is provided to the Sacramento and San Joaquin valleys and along the coast to Los Angeles.

Many steamship lines operate between San Francisco and other world ports, including those of the Pacific Islands, the Orient, South America, Europe, Africa, and the Atlantic and Gulf Coast. The port is also served by luxury passenger lines sailing to the Hawaiian Islands, the Orient, and around the world.

Many trucklines radiate over state and federal highways between San Francisco and other California points and neighboring states. In 1950 more than 600 truck operators having headquarters or agencies in San Francisco held intrastate or interstate permits. Numerous buslines provide frequent service between San Francisco and other points on the main highways, with four lines providing transcontinental service.

Bridges.—The San Francisco-Oakland Bay Bridge, a steel and concrete structure, opened to vehicular traffic on Nov. 12, 1936, required 3 years, 4 months, and 3 days to build. The bridge including the electric rail facilities cost $77,200,000 and was originally financed through revenue bonds purchased by the Reconstruction Finance Corporation. The total length of the bridge project end to end of approaches is 43,500 feet, or 8¼ miles. The total length of the navigable water span is approximately 12,000 feet. The bridge without approaches including island crossing is 23,000 feet long or approximately 4½ miles. The structure crossing the west channel comprises two complete suspension bridges with the central anchorage approximately in the middle of the west channel. The vertical clearance ranges from 200 to 218 feet above low water. The suspension towers are 474 feet and 519 feet above water.

An interesting unit of the bridge structure is the tunnel passing through Yerba Buena Island—76 feet wide, 58 feet high, and 540 feet long. The east channel is crossed by a cantilever span of 1,400 feet with two 510-foot anchor arms and

five truss spans of 509 feet each. Some of the pier foundations are the deepest underwater ever constructed, with one pier 235 feet below water and another approximately 200 feet. The two suspension cables are 28¾ inches in diameter and each contain 17,464 wires.

The entire structure is double-decked. Six lanes are provided for automobile traffic on the upper deck and three for trucks and stages on the lower deck, with two interurban electric line tracks. Operation of bridge train service commenced Jan. 15, 1939. Train and bus passengers numbered 20,697,905 in 1949, and vehicles crossing exceeded 27,339,680.

Actual construction on the Golden Gate Bridge commenced Jan. 4, 1933; the bridge was opened to pedestrian traffic May 27, 1937, and to automobile traffic on the following day. The bridge was financed by a bond issue of $35,000,000. The length of the bridge from bridgehead to bridgehead is 6,400 feet and from portal to portal 8,940 feet. There are six traffic lanes and two sidewalks. The main span, center to center, of piers is 4,200 feet, longest in the world. The clearance is 210 feet at piers and 220 feet at center, above mean high water. The two steel towers are 746 feet above water, or 191 feet taller than the Washington Monument. The distance from the base to top of the San Francisco pier is 846 feet—the highest and largest bridge tower in the world. Each cable is 7,660 feet long and 36½ inches in diameter and contains 27,572 wires. The distance between the two cables, center to center, is 90 feet. Vehicles crossing in 1949 totaled 9,014,972.

Air Transporation.—San Francisco and the bay area are tied together with the rest of the United States and the world by more than 20 major government certificated and noncertificated carriers offering passenger and cargo service. San Francisco International Airport is recognized as one of the world's major terminals and serves not only national lines but many lines operating to the Hawaiian Islands, Asia, and the Orient.

Communications.—One of the two-world communication centers in the nation is established in San Francisco. Regional headquarters of four major radio communication systems and one cable system direct their transpacific communications from San Francisco. The telephone and telegraph companies connecting the western regional areas with the nation are headquartered here. Other communications centered in San Francisco are the navy's Western Sea Frontier and the army's western command and relay stations for the Pacific overseas area; the Civil Aeronautics Administration operating the West Coast Overseas Foreign Air Communications station which gathers and disseminates important weather information throughout the vast radio network covering the Pacific and the Orient; the Aeronautical Radio, Inc., which serves the commercial airlines.

Government.—The site of the local government for the half century following the founding of the Presidio in 1776 was in one of the two-roomed houses of the military commandant. But on Dec. 7, 1834, citizens of Yerba Buena, on orders of Governor José Figueroa, assembled at the Presidio to choose electors for the *ayuntamiento* (district council). Francisco de Haro was chosen first alcalde (mayor) under Spanish rule of the Pueblo Yerba Buena.

On July 9, 1846, Capt. John B. Montgomery with 70 sailors and marines from the U.S.S. *Portsmouth*, dropping anchor in Yerba Buena Cove, came ashore and ran up the Stars and Stripes on Mexico's flagpole atop the adobe custom house, as the *Portsmouth* gave a 21-gun salute; on that day the rule of the village of Yerba Buena passed to the United States. On August 6, the captain appointed Lieut. Washington Alan Bartlett of the United States Navy as the first American alcalde of Yerba Buena.

During the next few years there were often disputes as to jurisdiction in the settlement. San Francisco received its first charter from the state's first legislature on April 15, 1850, leading California's admission to the Union on Sept. 9, 1850, by almost five months. The elected officers under the new charter held their first meeting on May 9, 1850. A year later a new city charter was adopted by the legislature. The Consolidation Act of 1856 authorized a merger of the city and county of San Francisco and created a board of supervisors. This new form of government was to last for 44 years.

In 1900, the electorate accepted a freeholder's charter which stood for 31 years. The charter outlined a policy for municipal ownership of utilities and set up a system of civil service. The Municipal Railway's first city-owned street railway in the nation began operation on Dec. 8, 1912, and in 1914 the city gained control of the Hetch Hetchy watershed near Yosemite which eventually supplied 400,000,000 gallons of water daily. The present charter, approved by the people in March 1931, became effective Jan. 8, 1932.

Under the state constitution the charter is not only the organic law of the city but it is also a law of the state within the constitutional limitations and free from any interference by the state through general laws. The charter is not a grant of power, but rather an instrument which accepts the privilege granted by the constitution of complete autonomous rule with respect to municipal affairs, and which otherwise serves merely to specify the limitations and restrictions upon the exercise of powers so granted and accepted.

The governmental structure of the city and county of San Francisco is both a county and a municipal corporation, and the functions performed by its officers in each instance determine whether it is to be viewed as a city or county.

The government consists of two branches: the legislative branch, made up of the board of 11 supervisors, and the administrative branch, presided over by the mayor and the chief administrative officer. The latter is appointed by the mayor. Elective officers are mayor, city attorney, assessor, district attorney, treasurer, sheriff, and public defender. Members of the board of supervisors and municipal court judges are also elected by the people.

Education and Culture.—San Francisco's educational facilities are outstanding in the West and rank among the nation's best, covering nearly all fields. In addition to the public school system, there are a number of private, parochial, nonsectarian, and technical schools. The public schools include the kindergarten, elementary day schools and special schools, junior and senior high schools, continuation and adult day and evening schools, and a junior college. Under the jurisdiction of the city department of education, there are 196 schools with a total average daily

attendance in 1950 of 76,211 students. The public school properties are valued at about $52,000,000.

The parochial school system, administered by a board of education of eight members and a superintendent and other assistants, comprises elementary schools, high schools, and academies for boys and girls.

Near the east end of Golden Gate Park is located the University of San Francisco with a 20-acre campus. It was founded in 1855 as St. Ignatius College and was chartered by the state in 1859. The name was changed in 1930. San Francisco State College, founded in 1899 for teacher training, is also located within the city, as is the City College of San Francisco, a municipal institution founded in 1935, and the San Francisco College for Women, a Roman Catholic institution founded in 1930. In addition, the University of California maintains several branches in San Francisco, including colleges in medicine, dentistry, pharmacy, law, and the California School of Fine Arts. Stanford University's colleges of dentistry and medicine are also located in San Francisco. The University of California at Berkeley and Stanford University at Palo Alto are both within comfortable commuting distance of San Francisco. Other institutions of higher learning in the immediate area, offering standard curricula, include the Dominican College at San Rafael and Mills College at Oakland. Many educational institutions have been approved to offer training to veterans.

There are also many centers of cultural interest such as the California Academy of Sciences; the Civic Center; libraries, both public and private, art museums, and concert halls.

Innumerable religious, civic, professional, business, historical, military, and foreign organizations have headquarters in San Francisco and hold regular meetings.

Buildings.—*Civic Center.*—The actual concept of the Civic Center was retarded by the destruction of the City Hall during the 1906 earthquake and fire, and it was not until 1912 when plans for the Panama-Pacific International Exposition were being considered, that a permanent staff of architects was appointed and a bond issue of $8,800,000 was authorized for purchase of land and construction of buildings.

The group of buildings includes the City Hall, started April 5, 1913, and dedicated Dec. 28, 1915 at a cost of $3,500,000. The dome is 308 feet above ground and is 112 feet in diameter. It is constructed of granite in French Renaissance style, occupies two blocks, and has been visited by many renowned persons, including some of the kings and queens of Europe and two presidents of the United States.

The Civic Auditorium was built in 1914 in connection with the Panama-Pacific Exposition at a cost of $1,350,000. The building contains one of the largest pipe organs ever constructed. Many great national conventions have been held here, including the 1920 Democratic Convention.

The San Francisco Public Library was completed in 1917 at a cost of $1,152,067, the city contributing $766,170 and the Carnegie Foundation $275,897. Here is housed the James D. Phelan Memorial, a collection of manuscripts and first editions of the works of California writers.

The War Memorial group, which comprises the Veterans War Memorial Building and the Opera House, was completed in 1932 at a cost of $6,125,000, $2,000,000 of which was reported raised by public subscription and $4,000,000 by bond issue. The Veterans Building contains the galleries of the San Francisco Art Association, and a gallery containing relics of the Civil, Spanish American and world wars. The Opera House was opened Oct. 2, 1932, with Lily Pons singing Tosca. The auditorium seats 3,285 persons. The stage is 131 feet wide, 83 feet deep, and 120 feet from roof to floor. It was in these buildings that representatives from many nations met in 1945 to construct a charter and establish an international organization to be known as the United Nations.

The Public Health Building was completed in 1933 at a cost of $709,110.

The Civic Center also includes the State Building completed in 1923 at a cost of $1,560,000 and the Federal Office Building at a cost of approximately $3,000,000, bringing the total city, state, and federal investment in land and buildings to approximately $22,000,000. To duplicate them today would require probably three times that amount. The State Building houses the Hastings College of Law of the University of California.

Commercial Buildings.—One of the interesting structures of San Francisco is the Ferry Building at the foot of Market Street. Completed in 1903, it has a central tower 240 feet high at the top of which is a clock with four faces, each dial being 22 feet in diameter with numerals 3 feet high. On April 18, 1906, the clock was stopped at 5:16 A.M. by the great earthquake that preceded the fire which devastated an area of 520 blocks and approximately 25,000 buildings. A large relief map of California runs along the entire second floor corridor. The Ferry Building is the San Francisco terminus for the Southern Pacific and Western Pacific railroads. In 1939 the Southern Pacific Company transferred its headquarters from New York to San Francisco, where it has a large office building on lower Market Street. The main post office building on Mission Street was completed in 1905 and survived the disaster of 1906.

Back from the waterfront several skyscrapers tower above the mass level, including the Pacific Telephone and Telegraph Company Building, 26 stories, the Russ Building, 31, and the Sutter Building, 25. Other prominent buildings include the Pacific Gas and Electric Company Building, Matson Building, Hobart Building, Mills Tower Building, Standard Oil Building, Shell Oil Building, Federal Appraisers Building, Western Merchandise Mart, and Metropolitan Life Building. The United States Mint Building on a height west of the Civic Center was finished in 1937. It is a rugged structure, five stories high in front and three in the rear, built of reinforced concrete and granite. The San Francisco Stock Exchange operates a 10-story office building and a one-story trading room, formerly the United States Sub-Treasury Building. The Union Square Garage is among the nation's most interesting buildings; it extends four stories below the surface of Union Square, and will park 1,700 cars simultaneously, or the equivalent of one fourth of all the curbside parking facilities in the downtown area.

The present Cliff House was built in 1907, was closed for a period of some years, then remodeled and reopened. Its two predecessors were destroyed by fire—the original building in 1894, the second in 1907. From the beginning it

has been a noted restaurant. It is perched high on a cliff overlooking the Pacific, at the northwestern corner of the city, west of the Presidio. From a lookout platform one may see the Seal Rocks where at times hundreds of sea lions lie sunning themselves. On clear days the Farallon Islands can be sighted.

Churches.—The Mission Dolores, one of the most interesting of the city's houses of worship (of which there are some 353 representing most denominations), was founded in 1776. The surviving adobe building was begun in 1782. No nails were used by the Indian builders; the roof beams were fastened with leather thongs. The interior was decorated with paint made of vegetable juices, in colors that have survived more than 150 years. Grace Cathedral represents the modern city, as the mission represents the original settlers; it is of gray stone, in modified Gothic style, with a carillon and many interesting relics. St. Patrick's Church and Old St. Mary's Church (not to be confused with St. Mary's Cathedral) go back to the San Francisco of the 1850's. Material and bells for Old St. Mary's were brought from China; the church is in Chinatown and has a Chinese branch. St. Mary's Cathedral was built in 1891 and survived the fire of 1906. It is the seat of the Roman Catholic diocese of San Francisco. St. Brigid's Church was built of old street paving blocks. In the Italian section is the Church of Sts. Peter and Paul. In the Pacific Heights district is Temple Emanu-el, a cream-colored building of modified Byzantine design, with a dome of red tile. The Tin How Temple is the oldest Chinese place of worship in the city; the Kong Chow Temple is the largest.

Hotels.—Among its 577 hotels San Francisco has several with interesting histories. The Palace Hotel replaces an original structure, destroyed by fire in 1906, in which a driveway was so arranged that guests could drive up to the desk. The great fire of 1906 was hardly through smoldering when a banquet was held in what remained of the St. Francis Hotel to introduce the period of reconstruction. Both built after the fire of 1906, the Mark Hopkins and Fairmount hotels are notable buildings; both have interesting ornamentation, especially the former's murals of early California history. From the "Top of the Mark" one has a magnificent view of the city and the whole bay area with its bridges.

Clubs.—The Olympic Club, organized in 1860, is an amateur athletic club. The Bohemian Club has a membership of artists and writers as well as friends of art and literature. The Native Sons of the Golden West and the Pacific Union Club have interesting houses of their own.

Special Points of Interest.—There are innumerable special points of interest in San Francisco which cannot be included here, but are described in careful detail in many of the books on San Francisco (see *Bibliography*).

A ride on the little cable cars continues to be a major experience, because of thrilling vistas to be seen as the cars glide over the steep hills.

On top of Telegraph Hill, which towers above the bay shore to a height of 300 feet, is Pioneer Park. From its center rises the Coit Memorial Tower, installed in 1933. Built of concrete in the form of a cylinder, it is 210 feet high and affords a wide view of the city and the bordering bay. Around Telegraph Hill is centered the Latin Quarter where many foreign restaurants cater to every taste.

Just westward stands Russian Hill, the crest of which was once used as a burying ground for Russian sailors. Now the hill is covered with residences, apartment houses, and the studios of many artists and writers.

South of here stands Nob Hill, so called because on it once stood the castle-like homes of the city's wealthy nabobs. It is now covered with hotels and apartment houses.

Somewhat northeast, in the heart of old San Francisco, lies San Francisco's famous Chinatown, covering a dozen squares or blocks, lined with Chinese restaurants, bazaars, theaters, joss-houses or temples, and shops of various kinds. But it is not the Chinatown of old, when gambling places and opium dens were almost as numerous as are the bazaars today. That passed out with the great fire of 1906.

Following the bay shore for three and a half miles is the Embarcadero, a crescent-shaped street edged with piers and wharves. Here at the end of Taylor Street is Fisherman's Wharf, famous for its seafood restaurants.

Beyond the Civic Center in the northwestern part of the city are the Presidio, Lincoln Park, and Golden Gate Park. The Presidio lies at the southern terminus of the Golden Gate Bridge, with the ocean on the west and the bay on the north. It is a United States military reservation with an area of 1,542 acres. The Spaniards established a garrison here in 1776. The original commandant's house, an adobe structure and the oldest building standing in San Francisco, was converted into a clubhouse for officers of the post. The original fortification was called Castillo de San Joaquin. In 1846 the United States flag was hoisted here, and in 1860 Fort Winfield Scott was built. The reservation includes Crissy Field, Letterman General Hospital for service men and their families, a Coast Guard station, the Marine Hospital, and a national cemetery.

Lincoln Park contains the California Palace of the Legion of Honor and the nearby marker at the western terminus of U.S. Highway 40. Beyond are Cliff House and the esplanade along the Pacific.

Golden Gate Park, three quarters of a mile wide and four miles in length, contains an abundance of cultural and recreational facilities: the Natural History Museum, the Steinhart Aquarium, the De Young Memorial Museum, the Conservatory, the Music Concourse, the Oriental Tea Garden, and Kezar Stadium.

The geographical center of San Francisco is on the east slope of Twin Peaks, which are slightly over 900 feet high. A figure-eight drive around the peaks offers a sweeping view. Nearby Mt. Davidson, in Mt. Davidson Park, is the highest point in San Francisco. On its peak is a cross, 103 feet high, at the foot of which Easter sunrise services are held.

Within the city are many interesting monuments and memorials. The Donahue Monument, commonly called the Mechanics' Monument, is a bronze representation of three workmen; it is dedicated to Peter Donahue, founder of one of the first iron works in the city. The Native Sons Monument celebrates California's admittance to the Union of States; it is a granite shaft topped by a bronze figure holding an open book with the entry "September 9, 1850." In Union Square is Victory Monument, commemorating Dewey's victory at Manila Bay. There are also memorials in metal or in stone to such famous person-

ages as Bret Harte, Robert Louis Stevenson, Junípero Serra, Sun Yat-sen, and St. Francis. The Spanish War Monument represents a mounted Victory, with a young soldier marching beside her. *The Triumph of Light,* a statue on Mt. Olympus, symbolizes the victory of light over darkness.

San Francisco Expositions.—San Francisco has been the scene of at least three important expositions. The latest and in some respects the most important was the Golden Gate International Exposition of 1939–1940. It was held on Treasure Island, a man-made island north of Yerba Buena in San Francisco Bay. The site was made by building great embankments of rock on the border of a shoal area, and then filling in with mud and sand dredged from the bottom of the bay. The island thus formed is a mile long and two thirds of a mile wide, a paved causeway joining it to Yerba Buena Island. Boat landings were built on the island. The first season of the exposition opened Feb. 18, 1939 and closed Oct. 29, 1939; total attendance was 10,496,203. Planned to celebrate the completion of the two great San Francisco bridges, the exposition scheme was broadened and became a Pageant of the Pacific. The second season of the exposition opened May 25, 1940 and closed Sept. 29, 1940; the total attendance for the two periods was 17,000,000.

The California-Mid-Winter Exposition of 1894 at Golden Gate Park was the first to be held in San Francisco. The Panama-Pacific Exposition in 1915, celebrating the opening of the Panama Canal, was also built on made land, now the Marina district of San Francisco.

History.—Until the early Portuguese, English, and Spanish explorers touched on the California coast, the San Francisco Bay area remained almost the farthest point distant on the globe in relation to civilization and known trade routes. The bay was equally remote from both European and Asiatic civilizations.

According to some historians certain ancient records of the Chinese indicate that a group of Buddhist priests, led by Hwui Shan, left Kabul (Afghanistan) in 458 A.D. and sailed along the lower reaches of the Pacific coast of North America, spending some time introducing Buddhism and the monastic system, and reforming the customs and manners of the people in the vicinity of Mexico which they termed Fusang, before returning to China in 499 A.D. But if this is true, more than 1,200 years were to pass before the events of history would span the gap between Mexico and San Francisco Bay, though today it can be spanned by air transport in 10 hours.

Meanwhile Hernando Cortés sent forth expeditions in 1532 on orders from Charles V, Holy Roman emperor and king of Spain, to seek a natural port well north of New Spain where Spanish navigators might find refuge on the long voyage from Manila to Acapulco, New Spain. But it took Spanish explorers 237 years to carry out this decree, and then it was the king's soldiers rather than his sailors who were finally to set eyes upon the great landlocked harbor behind the Golden Gate.

The first to come to the vicinity of San Francisco (Nov. 16, 1542) was a Portuguese explorer, Juan Rodrigues Cabrillo, who was recorded as discoverer of the group of islands about 27 miles westerly of San Francisco, later named the Farallon Islands. The stretch of water between the islands and the California coast he named La Bahía de los Pinos (Bay of Pines). He left Dec. 8, 1542.

Next, on June 17, 1579 (Julian calendar), Sir Francis Drake, famed English explorer, sailed into the sheltered indentation behind Point Reyes, now known as Drakes Bay, a few miles northwest of the site of San Francisco. During Drake's five-week stay, he became acquainted with the native Indians and found them friendly. He claimed the area as New Albion and set up a monument to establish the queen's title to the new kingdom, then sailed away July 23d.

On Nov. 6, 1595, Sebastian Rodrigues Cermeño, after sailing from Manila on July 5, came along the California coast near Cape Mendocino and entered Drakes Bay to which he gave the name La Bahía de San Francisco. In an attempt to explore the area more thoroughly, he constructed a smaller boat, but before it was completed his large ship was destroyed by a great storm. It is recorded that he took many soundings and became aware of the hazards of the area before he left Drakes Bay on Dec. 8, 1595.

Next Sebastián Vizcaíno visited the region in 1603, mapping the area outside the Golden Gate to the Farallon Islands as the Bahía de Puerto de San Francisco (Bay of the Port of San Francisco). The long headlands at the north end of the bay he named Punta de Los Reyes (King's Point). But there is no record that any of these explorers who journeyed by sea entered the Golden Gate.

Recorded history was to wait 166 years more before San Francisco Bay and the San Francisco Peninsula would be discovered by Gaspar de Portolá's expedition working overland up the coast in an effort to confirm the locations of both Monterey Bay and Bahía de San Francisco and establish claim to them. In the vicinity of Monterey, doubt as to where they were resulted in Portolá's directing his chief scout, Sergeant José Ortega, to proceed to check the area up to Point Reyes. During the scouting trip Ortega and his companions pushing northward, sighted on Nov. 2, 1769, from a prominence on the peninsula, an "arm of the sea," now known as San Francisco Bay. The only inhabitants encountered in the area were Indians who lived chiefly on simple food that grew wild, such as acorns, seeds, special grass, herbs, roots, and berries. There was no evidence of soil cultivation, and they had no domestic animals.

Until the ship, *San Carlos,* in command of Lieut. Juan Manuel de Ayala of the Spanish Navy, was able to sail through the Golden Gate, Aug. 5, 1775, "nothing but tule rafts of the Indians had graced the water of San Francisco Bay."

A year later, Juan Bautista de Anza arrived with colonists from Mexico and on March 28, 1776, selected a site for the Presidio, the first settlement in San Francisco. On March 29, 1776, a site for the Mission San Francisco de Asís (later called Mission Dolores) was selected. The Presidio was dedicated by Lieut. José Joaquin Moraga on September 17, and the mission was dedicated by Padre Francisco Palou on October 8. The first white baby was born at the site of Mission Dolores Aug. 10, 1776. When the Liberty Bell pealed the birth of the nation, San Francisco was a budding settlement.

Portsmouth Plaza was the cradle of the little village at Yerba Buena Cove near the waterfront, which for several decades remained an insignifi-

Nob Hill, looking toward Berkeley.

The Embarcadero.

SAN FRANCISCO

cant trading post frequented by rough seafarers. Yerba Buena was named after the aromatic vine which was found in the underbrush of the settlement. The first dwelling in Yerba Buena was put up by the first harbor master, Capt. William A. Richardson, an Englishman, June 25, 1835.

During 1836, Yerba Buena became an important trading post and the first commercial building, part dwelling and part warehouse, was erected for the first retail firm, owned by Jacob Primer Leese (Ohio born). On July 4, 1836, he summoned all the leading Mexican families and prominent persons to an Independence Day celebration which lasted for two days and a night. During this celebration, the Stars and Stripes was raised beside the Mexican flag for the first time in San Francisco. In the little cove, just under the southerly slopes of Telegraph Hill at Broadway and Battery, the first pile wharf was constructed in 1847.

With the conquest of California in 1846, Yerba Buena came under control of the Americans on July 9, 1846, and was soon to receive a new name. The first American alcalde, Lieut. Washington Alan Bartlett, on Jan. 30, 1847, issued an ordinance changing the name of the town to San Francisco.

Less than a year later, on Jan. 24, 1848, gold was discovered in Sutter's millrace on the American River. When the evidence reached San Francisco, the population, then about 900, started the first gold rush. Less than a dozen persons were left behind in the town. As the news spread around the world and ships came pouring in a year later, San Francisco was a cantonment of tents with a population of about 2,000. By 1850 the city boasted 25,000 inhabitants from the far corners of the earth.

As the confused settlement mushroomed, there were periodic fires and prompt rebuilding. There was lawlessness and the stern suppression by the volunteer Viligance Committee, organized on June 9, 1851. By 1854 the rich placer mines began to run out but in 1858 a new gold strike in British Columbia, along the Fraser River, caused an exodus from San Francisco of some 18,000 persons and considerably lightened the unemployment burden.

The physical rebuilding and transformation of the city into a solidly built metropolis began as the people turned to commerce and industry to supply the growing needs of the agricultural districts as well as the mining districts. It was in 1873 that the first cable cars were installed. The city grew steadily. Then came 1906—and the earthquake and fire that devastated the city. The first shock occurred at 5:16 A.M., April 18, 1906. The earthquake damaged the water system and fire broke out and raged for three days, being finally stopped by dynamiting buildings in its path. Some 500 persons were dead or missing; 25,000 buildings had been destroyed. The damage was estimated at half a billion dollars. Immediately the work of rebuilding the city was begun.

San Francisco became increasingly important as a seaport and the financial, distribution, and manufacturing headquarters for business and commerce of a vastly rich region with its greatly diversified resources. The city continued to hold this important position; following the outbreak of World War II, this area cleared more military cargo than any other port in the nation. During the height of the war shipbuilding program, the San Francisco Bay area was foremost. The San Francisco Port of Embarkation during the war in the Pacific was designated by its commanding general as "the most important port in the world," and as the war ended operated at new highs.

San Francisco was host to the delegates from the many nations assembled there from April 25 to June 26, 1945, to construct the Charter of the United Nations and to establish an international organization to be known as the United Nations.

During the war and postwar periods nearly 200,000 new residents settled in San Francisco and more than a million new residents settled around San Francisco Bay, bringing new demands and creating new opportunities in this area.

RALPH B. KOEBER,
Research Department, San Francisco Chamber of Commerce.

SAN FRANCISCO BAY. A landlocked bay separated from the Pacific Ocean by the

Golden Gate channel, on the coast of California. It contains a number of islands, of which Alcatraz —formerly a fortified island, and presently the site of a Federal prison—Angel, and Yerba Buena (or Goat Island) are the largest. Including San Pablo at its northern point, the bay is 55 miles long and from three to 12 miles wide. San Pablo Bay on the north, about 10 miles wide and nearly circular in shape, is connected with Suisun Bay, about eight miles long and four miles wide, by the Straits of Carquinez. Several smaller bays furnish harbor advantages for towns on the mainland.

SAN FRANCISCO CONFERENCE. See PACTS AND CONFERENCES: WORLD WAR II.

SAN FRANCISCO PANAMA-PACIFIC EXPOSITION. Held to celebrate the opening of the Panama Canal and the quarter-centenary of the discovery of the Pacific this exhibition was opened at San Francisco Feb. 6, 1915 by President Woodrow Wilson, who pressed a button that swung open the doors and set the mechanical exhibits in motion. In March 1911 Congress selected San Francisco as the site for the exposition and Oct. 14, 1911 President Taft turned the first shovelful of dirt on the chosen site. The location fronted on San Francisco Bay for nearly 2½ miles and its average depth was about half a mile, giving it an area of 625 acres. Forty-two foreign countries and 43 states contributed approximately 80,000 exhibits. About 400,000 persons visited the grounds on the opening day. The total attendance was 18,756,148; the total receipts $12,525,088—$4,715,523 from admission fees; $7,809,565 from concessions. California, San Francisco, private corporations and individuals subscribed $20,000,000 to finance the enterprise.

SAN FRANCISCO PEAKS (also SAN FRANCISCO MOUNTAIN), a conical mass with area of about 40 square miles rising about 5,000 feet above the Arizona Plateau, a few miles north of Flagstaff, Coconino County, Arizona. Its two highest summits are San Francisco Peak, 12,611 feet and Agassiz Peak, 12,340 feet. The mountain consists of moderately old lavas and breccias, the products of five distinct stages of eruption. The old vent is near the center and the top has been somewhat lowered by erosion. It is estimated that the lava outflows had a volume of 38 cubic miles and they piled up as a viscous mass on a platform of Kaibab limestone, constituting the general plateau. The mountains are partly covered with pine woods. From the top there is a wonderful view of Grand Canyon to north, Painted Desert and Hopi Buttes to east and many recent cinder cones and lava flows on all sides

SAN GABRIEL, săn gā′brĭ-ĕl, city, California, in Los Angeles County; altitude 429 feet; south of the San Gabriel Mountains in the Angeles National Forest; 9 miles east of Los Angeles; on the Southern Pacific Railway. San Gabriel is a residential city and a readily accessible suburb of Los Angeles, located in a rich fruit and vegetable growing district that has likewise important poultry interests; is a retail center and has numerous small manufactures, together with many feed grinding and mixing plants. The city has excellent school and library facilities, and is famous for the Mission San Gabriel Archangel, built in 1771. Until well into the 19th century the mission was the first point of civilization west of the desert; and it was from its portals that the Spanish governor, Felipe de Neve, set out in 1781 to found the pueblo that later became the great city of Los Angeles. San Gabriel Mission, now a parish church, has a mission high school, and a parochial elementary school. The visitor will find some of the finest mission architecture in San Gabriel. There is a baptismal font, statues and paintings brought from Spain in early times. There are a number of adobe houses. San Gabriel received its city charter in 1913. Pop. (1940) 11,867; (1950) 20,343.

SAN GERMAN, săng hĕr-män′, town, Puerto Rico, located near the southwestern coast, near Mayaguez. One of the oldest towns on the island, it was settled in 1511. In the regions around it, sugar, coffee, tobacco, and a variety of fruits grow. It has one of the oldest Catholic churches on the island. It is the site of Polytechnic Institute, operated by American Protestants, and a center of both collegiate and vocational studies. Pop. (1948) 8,872.

SAN GERMANO, Italy. See CASSINO.

SAN GIMIGNANO, sän′ jē-mē-nyä′nō, city, Italy, in the province of Siena. About 18 miles northwest of Siena, San Gimignano, the "city of beautiful towers," named for a 4th century bishop of Modena, is finely situated on a height about three miles from the left bank of the Elsa, a tributary of the Arno. Its medieval aspect is virtually unaltered, the town walls, palaces and towers recalling the 13th and 14th centuries. In consequence of a violent struggle between its two chief families, the Ardinghelli and the Salvucci, it submitted to the republic of Florence which, in 1354, incorporated it with surrounding districts, and to better maintain control built the castle of Montestaffoli, completed in 1358. One of the most interesting of the smaller Tuscan centers, it is a mecca of art lovers. Its 12th century collegiate church and the church of St. Augustine contain frescoes by Benozzo Gozzoli. During World War II it was severely damaged by air bombing, but repairs have been made. Pop. (1950 est.) 3,800.

SAN ILDEFONSO, ēl-dā-fŏn′sō, or **LA GRANJA, Treaties of,** two secret agreements between France and Spain, both extremely disadvantageous to Spain. (1) Arranged in 1796, while France was at war with England, pledged the two countries to support each other in time of war with 25 ships and 24,000 troops, of which 6,000 were to be cavalry; an agreement which at once involved Spain in the war then in progress and for which she was severely punished by England. (2) Concluded Oct. 1, 1800 and ratified Oct. 30, 1800, by which Spain receded to France the territory of Louisiana, with the understanding that the territory was not to be sold by France except to Spain; in return for which Napoleon agreed to make the Duke of Parma king, adding either Tuscany or the Roman legations to his territory, so that the population of his kingdom should be above a million. Napoleon, however, disregarded the treaty and sold Louisiana to the United States without consulting Spain.

SAN ISIDRO, sän′ē-se′thrō, town, Philippine Islands, capital of the Province of Nueva

Ecija, Luzon on the Grande de la Pampanga River, 48 miles north of Manila. It is a well-built town, at the intersection of several main highways which connect it with Manila, with several points on the Manila and Dagupan Railroad and with other important towns. It is in a fertile agricultural region and has a considerable trade in rice and corn. Pop. (1939) 2,192.

SAN JACINTO, Battle of, final battle of the war between Texas and Mexico which gained for the former her independence. The battle took place April 21, 1836, on the banks of the San Jacinto River, about 20 miles from the present city of Houston, and resulted in the overwhelming defeat of 1,600 Mexicans under Santa Anna by 783 Texans under Gen. Sam Houston. The Mexican casualties were: 630 killed, 200 wounded, 730 taken prisoners; the Texan casualties were: seven killed, four mortally wounded. A magnificent monument, 570 feet four inches high, marks the place where the battle was fought. It was dedicated Apr. 21, 1937.

SAN JOAQUIN, a river of California which has its rise in a small glacier southeast of the Yosemite Valley, near Mount Lyell, on the east slope of the Sierra Nevada. It flows southwest about 100 miles; then in Fresno County it changes its course to a northwest direction to its confluence with the Sacramento River; then flows west into Suisun Bay. In Fresno County it receives the waters of Tulare system of lakes through King's River, after which it passes through the Sanjon, or Big Salt, Slough. It is about 350 miles long, and is navigable for 50 miles to Stockton all the year, and in winter and spring about 200 miles farther.

SAN JOSE, hō-sā′ ctiy, California, and Santa Clara County seat; altitude 100 feet; in the Santa Clara Valley; 40 miles southeast of San Francisco, 7 miles from the southern tip of San Francisco Bay; on the Southern Pacific and Western Pacific railroads. San Jose and Santa Clara to the northwest are one continuous community; between the two runs The Alameda, a boulevard with triple rows of willows and sycamores. The county has over 64,000 acres given over to the raising of prunes (first grown here in 1856) and more than 20,000 acres in apricots, as well as extensive areas planted in grapes, pears, walnuts and cherries. The city is thus a shipping point for fresh, canned and dried fruit and headquarters for the cooperative California Prune and Apricot Growers Association. Here are plants for making fruit and fish cans, canning and packing machinery, and labels for food and other products.

Several types of wine are bottled here, including champagne. There are railroad repair shops and foundries, and other industries are concerned with spray chemicals (the spray gun was invented here in 1883), cement, oil well supplies, pumps, pottery, ladders and playground equipment, meat packing, lumber, boatbuilding and breweries. Near San Jose is located America's greatest cement plant, Permanente Corporation, at Monte Vista, which employs over 1,000 persons. Because of the success of the Permanente management, the National Defense Commission approved an allocation of $21,000,000 for the erection of a gigantic magnesium plant near the cement plant site. The output of this plant will treble the total United States production of magnesium.

Santa Clara County is known as the "Valley of Heart's Delight." The Municipal Rose Garden (five and a half acres, opened in 1931) has roses of many varieties blooming throughout the year; in May more than 100,000 bushes are in flower. City Hall Park has a Civic Auditorium (1936), seating 3,300. Montgomery Theater and Dunne Hall are used by little theater groups. Rosicrucian Park, American headquarters of the AMORC (Ancient Mystic Order of the Rosae Crucis), has a planetarium, Egyptian Temple and Oriental Museum. The poet Edwin Markham lived in San Jose, 1857–1899; his home is now a part of his alma mater, San Jose State College (1857; moved here from San Francisco in 1871). It has a 26-acre campus in Washington Park. Alum Rock Park (716 acres), 6 miles east, belongs to the city and has 22 mineral springs, sulphur baths, bridle paths and strange rock formations. Mount Hamilton Road leads to Lick Observatory, 25 miles east, a department of the University of California. At Moffett Field Airport, 9 miles northwest, near Sunnyvale, is the U.S. Ames Aeronautical Research Laboratory. In San Jose is Bellarmine College Preparatory School, and in Santa Clara the University of Santa Clara.

San Jose was founded in 1777, as was the Mission Santa Clara, and the mission San José in 1797. In 1846 the territory came under the flag of the United States, and in 1849–1851 San Jose was the capital of California. It was the first city in the state to be chartered, in 1850. Fruit growing then began to replace cattle raising as the major industrial activity. Dried prunes were first shipped out of the state in 1867. Peaches and pears were first canned commercially in 1871; and in 1875 the first iced shipment of fresh fruit was made from this valley.

A morning paper, *Mercury-Herald* (1851), has a Sunday edition; the *Evening News* dates from 1883. Radio station KQW began experiments here in 1909, was licensed and had entertainment programs in 1912, and in 1915 broadcast music to the Panama-Pacific Exposition in San Francisco.

In 1916 the council-manager form of government was adopted. Pop. (1950) 95,280.

SAN JOSE, city, Costa Rica, capital of the republic and of San José Province, on an elevated plateau 4,500 feet above sea level, about 15 miles northwest of Cartago (the ancient capital), with which it is connected by rail; on the Inter-American Highway. It is in a rich agricultural district and is a center of commerce, on the Pacific and the Costa Rica railways. The most conspicuous buildings are the palaces of the president, and the bishop and the National Palace; the University, to which is attached a medical school and a museum; the restored cathedral, and the National Theatre, a monument of artistic beauty, containing Italian marbles, pillars, columns, statues, and frescoes, and in its elaborate decorations resembling the Library of Congress at Washington. It cost almost $1,000,000. There is a good school system and the city is progressive. The merchants are mostly foreigners. The railroads, banks and electric-light plants were largely built by English capital. Coffee is the principal product. San José is a popular health resort. Pop. (1950) 86,909.

SAN JOSE, săn (h)ō-zā′, or **PUERTO SAN JOSE**, town, Guatemala, in Esquintla Department, is the chief Guatemalan port on the Pacific, and is also a rail terminus and tourist resort, 26 miles south of Esquintla. The principal exports are coffee, sugar, and lumber. Pop. (1950) 2,683.

SAN JOSE, town and municipality, Republic of the Philippines, in Nueva Ecija Province, central Luzon, 20 miles north of Cabanatuan, is a rail terminus and agricultural center. The chief crops are rice and corn. Pop. (1948) town, 10,544; municipality, 33,017.

SAN JOSE, department, Uruguay, on the Rio de la Plata; area 2,668 square miles. The rolling plains with rich soil and abundant water are favorable to stock raising and the growing of wheat, corn, flour, and fruit.

The department was set up in 1816 as a much larger territory. It included the present departments of Florida and Flores which were separated in 1856 and 1885 respectively. San José is the capital and chief city. Pop. (1953 est.) 98,627.

SAN JOSE, city, Uruguay, capital of San José Department, is situated on the right bank of the San José River, 50 miles northwest of Montevideo, on the railroad linking Montevideo with Mercedes. It is a center of the cattle and grain trade and also has flour mills. Founded in 1783 by 46 families from La Coruna, Spain, it became the provisional capital of Uruguay during the anti-Brazilian uprising of 1825–1826 led by Juan Antonio Lavalleja and 32 other patriots, sometimes called the revolt of the 33. (See URUGUAY—*History*.) Dominating the main plaza of the city is one of the largest churches in Uruguay, a structure in the Renaissance style with two bell towers and a cupola. Pop. (1953 est.) 25,000.

SAN JOSE, island and military base, Panama, in Panama Province, is one of the Pearl Islands in the Gulf of Panama. It has an area of about 25 square miles. Since World War II it has been used by the United States as a military base.

SAN JOSE DE BUENAVISTA, săn (h)ō-zā′ dĕ bwā-nä-vĭs′tä, town and municipality, Republic of the Philippines, on Panay Island, capital of Antique Province, is located 40 miles northwest of Iloilo, on Cuyo East Pass. It is a rice-growing and copper-mining center, exporting copper, copra, rice, and sugar. Pop. (1948) town, 5,159; municipality, 34,639.

SAN JOSE DE CUCUTA. See CUCUTA.

SAN JOSE STATE COLLEGE, San Jose, Calif., founded in 1862, is the oldest state-owned public educational institution in California. The first building was a large frame structure of native redwood. When this burned during the 1870's, a four story brick building was erected. Since that time, many buildings have been added, several in the California mission style. The Health Home, or college infirmary, a simple old-fashioned redwood house, was once the home of the poet Edwin Markham, a graduate of the college. *The Man With the Hoe* (1899) was written here. The average yearly student enrollment is 7,000.

SAN JUAN, säng hwän′, province, Argentina, bounded on the north and east by La Rioja Province, on the south by San Luis and Mendoza provinces, and west by the Andes along the Chilean border; area 34,910 square miles. It is mountainous, with fertile, irrigated valleys, drained by the San Juan and Bermejo rivers. The valleys have a dry, Mediterranean climate, and raise wheat, corn, wine, alfalfa, fruit, olives, apples, bees, cattle, horses, sheep, and goats. Industries are lumbering, mining, flour milling, meat packing, wine making, alcohol distilling, dairying, brewing, and food canning. Mineral resources include lime, iron, manganese, aluminum, lead, silver, mica, asbestos, graphite, copper, molybdenum, and tungsten, though they have not been extensively exploited. The capital and chief city is San Juan (q.v.). Pop. (1947) 261,229.

SAN JUAN, city, Argentina, capital of San Juan Province, is on the San Juan River, 600 miles northwest of Buenos Aires; altitude 2,100 feet. It is the rail, industrial, commercial, and educational center for an important viticulture area, and has local trade with Chile, dealing in wine, frozen meat, dairy products, dried fruit, canned foods, machinery, cement, and timber. It has a national college with the mining faculty of Cuyo University, an agricultural school, a seismographic station, historical museum, and administrative buildings. The Sarmiento Library is housed in the birthplace of the famous statesman Domingo Faustino Sarmiento. The city was founded in 1562 by Juan Jufré y Mallea, and was originally called San Juan de la Frontera because of its situation on the Indian frontier. It became a Roman Catholic bishopric in 1834 and an archbishopric in 1934; in 1944 it suffered severe earthquake damage. Pop. (1947) 81,747.

SAN JUAN, capital city, Puerto Rico. The old city, situated on two rocky islets off the northeastern coast, is connected by a causeway and bridges with a residential section, Santurce, on the mainland. In 1951, the adjoining city of Rio Piedras was merged with San Juan.

Founded in 1521 by Ponce de León after he abandoned his first settlement at Caparra four miles to the south, San Juan was often attacked by British, French, and Dutch. (See PUERTO RICO—*History*.) By the 17th century, San Juan was one of the most secure strongholds in the Americas, never captured except when George Clifford, Earl of Cumberland, took it from a garrison weakened by disease in 1598. Clifford was forced to relinquish his prize because his own soldiers became sick.

The city contains many architectural remnants of early colonial times. La Fortaleza was built as a fort, but condemned as such by a Spanish governor, who said that "only blind men would have chosen such a place for a fort." It was partially burned by the Dutch in 1625 and rebuilt in 1639 very much as it remains today. It serves as office and residence of the governor of Puerto Rico. The Cathedral of San Juan Bautista was built between 1542 and the 19th century, with several reconstructions made necessary by earthquake, hurricane, and fire during the Dutch invasion. San José Church, completed in 1528, is considered the oldest church in the Western Hemisphere in continuous use. It was damaged by the bombardment of Admiral Sampson's fleet during the Spanish-American War. The Castillo del Morro (Morro Castle), overlooking the Atlantic at the northwest tip of the city, is a gigantic and complicated series of fortifications begun in 1540 and completed in 1606. Its walls exhibit scars from Admiral Sampson's shelling. In

addition there are a large number of old colonial mansions with arcaded patios and wide staircases, many paved with rare Spanish tiles.

Modern San Juan shows both the effects of extreme poverty and of energetic efforts to acquire what many Puerto Ricans somewhat wistfully call an American standard of living. Particularly since the 1930's, slums have been a serious problem in San Juan. Villages of shacks have sprung up in areas of wasteland and swamp, often raised on posts above the tide. It is not unusual to find flimsy structures of tin cans and debris nestled incongruously in wild water lilies and hibiscus. One such slum is cynically named La Perla (The Pearl), others—realistically—Salsipuedes (Try-and-get-out) and El Fanguito (Little Mudhole). The city and the commonwealth government have attempted to remove these slums by moving people into housing projects and by supplying trucks to transport the shacks to free land. Under another plan, the government buys lots for an average of $700 each for the relocation of tenants who get use rights in return for labor, such as building roads, water lines, sanitation facilities, schools, and churches. Rehabilitation centers have been opened for San Juan beggars. In contrast, new suburbs have grown since World War II, with hotels,

Photograph by Hamilton Wright

Bird's-eye view of San Juan, Puerto Rico.

apartment houses, and private homes in both contemporary design and in the traditional Spanish style.

San Juan contains about 20 per cent of Puerto Rico's population in 47 square miles, and 43 per cent of the island's $400,000,000 property tax is levied here. Consequently, the effects of the government's "Operation Bootstrap," an effort to industrialize and diversify the island's economy, is especially apparent here. Businesses that have expanded San Juan since 1948 include garment manufacturing, plastics, electronic appliances and equipment, textiles, machine tools, shoes, chemicals, drugs, publishing, jewelry, asphalt products, and food distribution. These firms have been attracted by the government's program of granting comprehensive tax exemptions to new industries, a program which was extended and expanded under the Industrial Incentive Act of 1954.

Shipping facilities as well as an abundant supply of labor and tax exemptions have also attracted new business. San Juan harbor, a large and almost land-locked bay, is one of the best in the West Indies. Ocean freight to ports in continental United States is cheap as compared with rail and road transport. In 1955, the $23 million San Juan Port Project was in progress: diverting a river; making new land; and building a marine terminal, transit sheds, new berths, market buildings, grain elevator, meat packing plant, and feed mill. San Juan handles more than two thirds of the 4 million short tons of cargo handled by all twelve of Puerto Rico's ports. Since Puerto Rico is part of the United States, freight to continental United States must be transported in United States ships. San Juan has the busiest airport in the Caribbean, with about 80 flights a day carrying more than 1,300 passengers. A new airport was completed in 1955.

San Juan is the financial center of Puerto Rico and for many businesses through the whole Caribbean area. The Federal Deposit Insurance Corporation insures all accounts of three local and two New York banks. The city is governed by a board of 13 commissioners, 7 chosen by direct election and 6 appointed by the governor. This board chooses a city manager, whom it is pledged to choose before elections. Schools are organized like those in the United States. Classes are conducted in Spanish. Pop. (1950, including the former city of Rio Piedras) 357,205.

SAN JUAN, săn wŏn′, city, Texas, in Hidalgo County, in the lower Rio Grande Valley, 220 miles south of San Antonio, on the Missouri Pacific Railroad. Pop. (1950) 3,407.

SAN JUAN, säng hwän′, river, Central America, part of the boundary between Nicaragua and Costa Rica. The outlet of Lake Nicaragua, it flows southeast for 120 miles into the Caribbean Sea.

SAN JUAN, săn wŏn′, river, United States. Rising in the San Juan Mountains, southwestern Colorado, it flows south and west for about 400 miles through northwestern New Mexico and southeastern Utah to join the Colorado River near Rainbow Bridge National Monument. It irrigates areas of these three states.

SAN JUAN BAUTISTA. See VILLAHERMOSA.

SAN JUAN BOUNDARY DISPUTE, in the history of Great Britain and the United States a controversy over the possession of the San Juan Islands in Puget Sound. The British-American treaty of 1846 fixed the boundary between western United States and Canada at 49° north latitude to the middle of the channel separating Vancouver Island from the mainland. But the treaty was vague as to the precise channel. The United States claimed it was Haro Strait. Great Britain claimed it was Rosario Strait. Consequently, both claimed the San Juan Islands, which lie between.

The so-called "Pig War" ensued. Local authorities of both nationalities attempted to collect taxes and customs in the disputed territory. The height of hostilities was reached in 1859, when a pig belonging to Charles J. Griffin, an Englishman, raided the vegetable garden of Lyman A. Cutler, an American. Cutler shot the pig. Troops of both countries rushed to protect national interests. The 9th Infantry, the United States force on the islands, was commanded by Captain George Pickett, who later led the famous charge at Gettysburg.

Cooling off during the period of arbitration, British and American soldiers vied in the exchange of parties and banquets. In 1872, Emperor William I of Germany, as arbiter, awarded the islands to the United States.

SAN JUAN CAPISTRANO, săn wŏn kä-pē-strä′nō, village and mission, California, 60 miles south of Los Angeles. The village grew up around the mission in the late 18th century and once declared war on Mexico because of harsh treatment of Indians by Mexican officials. Pop. (1950) 758.

The mission was dedicated by Father Junípero Serra in 1776 and named for St. John of Capistrano, the Crusader. Construction was completed in 1806. Built in the form of a cross 180 by 90 feet, the church was once one of the highest triumphs of California mission architecture, with seven domes and a tall campanario or belfry that could be seen for 10 miles. But it was used only six years before an earthquake wrecked the roof, cloisters, nave, five domes, and campanario—killing 29 persons. An attempt to rebuild with adobe in 1865 was thwarted by heavy rain.

The "Capistrano swallows" are said to have nested in the ruins since Spanish colonial times, leaving the mission on every St. John's Day, October 23 (the death day, not the feast day), and returning on every St. Joseph's Day, March 19. It is reported that they have been late only once, delayed four hours by a storm at sea.

A number of legends are woven about Capistrano—involving a dark-robed Franciscan ghost, bells that toll in spite of motionless bell ropes, and an Indian girl novice dying with the reverberations.

The cloister of San Juan Capistrano Mission.

SAN JUAN DE LA MAGUANA, säng hwän′ dā lä mä-gwä′nä, city, Dominican Republic, since 1938 capital of Benefactor Province, is located 90 miles northwest of Ciudad Trujillo, in the valley of the San Juan River, in the western mountains. It is on a highway and has an airfield. The soil is fertile, producing rice, coffee, corn, and fruit, and more irrigation would increase its productivity. Pop. (1950) 10,093.

SAN JUAN DE LOS MORROS, dā-lōz mō′rōs, town, Venezuela, capital of Guarico State, 50 miles southwest of Caracas, on the highway to Ciudad Bolívar, is a health resort with warm sulphur springs patronized by Venezuelans. Its chief commercial resource is natural gas from which krypton, helium, argon, and neon are derived. Pop. (1950) 13,580.

SAN JUAN DE ULUA, dā ōō-lōō′ä, or **SAN JUAN DE ULLOA,** 17th century fortress, Mexico, on the small island in Veracruz Harbor where Hernán Cortés landed in 1519. The fortress was the last Mexican stronghold held by the Spanish before their expulsion in 1821.

SAN JUAN DEL NORTE, děl nôr′tā (formerly GREYTOWN), town, Nicaragua, in Rio San Juan Department, at the northern mouth of the San Juan River, on the Caribbean seacoast, about 75 miles south of Bluefields. It exports small amounts of bananas, coconuts, hardwood, rubber, and tortoise shell. The British occupied it in 1848 to forestall the building of a canal across Nicaragua by the United States. (See CLAYTON-BULWER TREATY.) During the mid-19th century gold rush days it was a transfer point and trading center on the sea route to California. In reprisal for an attack by a Nicaraguan mob on the United States legation in 1854, the town was bombarded by the sloop of war *Cyane* commanded by George N. Collins. In November 1857, William Walker (q.v.) landed here on a filibustering expedition. Pop. (1950) 307.

SAN JUAN DEL RIO, děl rē′ō, city, Mexico, in Querétaro State, on the central plateau, is 79 miles southeast of Querétaro, on a railroad; altitude 6,243 feet. Famous for its opals mined at nearby La Trinidad, it is also a mining center for silver, lead, and copper, and an agricultural market center for wheat, corn, alfalfa, sugar cane, beans, fruit, and livestock. Pop. (1950) 7,507.

SAN JUAN DEL SUR, sōōr′, town, Nicaragua, in Rivas Department, 14 miles south of Rivas with railway connection, is a seaside resort and port on the Pacific, exporting coffee, sugar, and lumber. During the 1849 California gold rush it was the Pacific terminus of the transisthmian route to the gold fields. It has

submarine cable connection with Mexico and Panama, and is a station for regular steamers. Pop. (1950) 1,019.

SAN JUAN HILL, Battle of. See SANTIAGO DE CUBA.

SAN JUAN ISLANDS, a group belonging to the State of Washington. They begin in the Strait of Georgia and extend south into Puget Sound. The largest islands of the group are San Juan, Oreas, Lopez and Shaw. In 1850 these islands were claimed by both the United States and Great Britain, and both American and British garrisons were stationed on them. See also SAN JUAN QUESTION.

SAN JUAN MOUNTAINS, the southern part of the western range of the Rocky Mountains in southwestern Colorado, mostly in San Juan, San Miguel, Mineral, Hinsdale, Archuleta, Rio Grande and Conejos counties. It is about 100 miles long from northwest to southeast. Many of its peaks are more than 13,000 feet above sea level. Mount Wilson 14,250 feet high being the highest.

SAN JUAN QUESTION, in American history an early boundary line dispute between the United States and Great Britain. In negotiating the treaty of 1846, by which the 49th parallel, from the Rocky Mountains to the sea, was made the boundary, a controversy arose concerning the course of the line through the channel which divides Vancouver Island from the mainland. The Americans contended for the Canal de Haro, the British for the Rosario Strait. To avoid conflict, it was decided that both nations occupy the island of San Juan at opposite ends. In 1872 Emperor Wilhelm I of Germany, acting as arbitrator, decided for the United States.

SAN LEANDRO, săn lē-ăn′drō, city, California, in Alameda County; altitude 48 feet; adjoining Oakland on the south; on the Southern Pacific, and the Western Pacific railroads. A residential and industrial city, its manufactures include air conditioning and mechanical draft equipment, aircraft supplies, and automobile parts. It is an important horticultural center. Settled in 1836, it was incorporated in 1872. Government is by council-city manager. Pop. (1950) 27,542.

SAN LUCAR DE BARRAMEDA, săn lo͞o′kär thä vär-rä-mä′thä, city, Spain, a seaport in the Province of Cádiz, Andalusia, at the mouth of the Guadalquiver, 17 miles north of Cádiz. The most conspicuous buildings are several convents and the palace of the duc de Montpensier, containing valuable art treasures; the ruins of a Moorish castle; churches; townhouse; and the St. George Hospital, which dates from 1517. There are good schools, usually directed by religious orders. The chief occupations of the inhabitants are fishing and viticulture. Olives, tropical fruits, and vegetables are grown, and there is considerable trade in sherry wines. The chief imports are coal from England; sulphur and vegetables from France; exports are salt, wine, fruit, and oats. Columbus embarked from this point on his third voyage, and Magellan on his voyage of 1519. Pop. (1940) 28,446.

SAN LUCAS, săn lo͞o′kăs, **Cape,** the southern extremity of the peninsula of Lower California, Mexico.

SAN LUIS, săn lwēs′, province and city, Argentina. (1) The province is situated in the central west of the republic, with an area of 28,520 square miles. At the northeast terminates the Sierra de Córdoba; through the northeast extends the Sierra de San Luis rich in copper and precious metals, which are, however, little exploited. In the south extend salty pampas. The climate is dry and healthful, marked by great extremes. The rivers include the Rio Quinto, Conlara, and Pampa de las Salinas; transportation facilities are poor, and there is little industry. Until 1776 it was part of Chile, from which date, together with the modern provinces of Mendoza and San Juan, it comprised the vast Cuyo region until 1820, and became a separate province in 1832. Pop. (1947) 165,546.

(2) Capital of the province of San Luis, at the southern extremity of the Sierra de San Luis, on the Chorrillo, 480 miles northwest of Buenos Aires on the transcontinental railway. It has a national college, normal and primary schools, and a branch bank. Nearby are the Potrero de Funes irrigation dam and hydroelectric station. The chief industries are sawmills, flour mills, and plaster factories. Founded in 1596 by Martín de Loyola, governor of Chile, it was formerly called San Luis de la Punta. Pop. (1947) 26,152.

SAN LUIS OBISPO, săn lo͞o′ĭs ō-bĭs′pō, city, California, and San Luis Obispo County seat; altitude 201 feet; on the Southern Pacific Railroad; and Pacific Coast Railway, 8 miles from Port San Luis on San Luis Obispo Bay, an arm of the Pacific Ocean; and midway between San Francisco and Los Angeles. It is in an agricultural region. The industries are chiefly connected with farm and dairy products; the cultivation and shipping of fruits and nuts; manufacture of brick and tile; development of chromite deposits; and the transportation and refining of oil. California State Polytechnic College is here. The town grew up around the mission established here by Fray Junípero Serra in 1772. It became a pueblo in 1844 and was incorporated as a city in 1856. Pop. (1950) 14,180.

SAN LUIS POTOSI, pō-tō-sē′, an inland state, north central Mexico. Its surface consists almost entirely of a plateau, some 6,000 feet in altitude, occasionally broken by ridges. The upland climate is moderate and the soil fertile, but an inadequate rainfall generally confines agriculture to irrigated areas. The southeastern section, however, separated from the plateau by the Sierra Madre Oriental, is a semitropical area with elevations of less than 1,000 feet where coffee, sugar, tobacco, fiber plants and tropical fruit are grown. In this region is the state's only important river, the Pánuco, which with numerous confluent streams, flows eastward out of the mountains to empty into the Gulf of Mexico at Tampico. Considerable numbers of livestock are raised in the state, and hides, tallow and wool are exported. The rubber-producing guayule is a crop of increasing importance. Mining, however, is the leading activity, being concentrated on the plateau, between the Catorce district, where mines have been worked since the 1770's, and the capital city of San Luis Potosí, where there are large processing plants. Silver, lead, gold, copper,

mercury, and cinnabar are the principal ores mined. The area of the state is 24,417 square miles. Pop. (1950) 855,336.

SAN LUIS POTOSI, city, Mexico, capital of the State of San Luis Potosí and an important mining center. It is situated 225 miles northwest of Mexico City in an arid region at an elevation of some 6,100 feet, which gives it a moderate climate. Many of the buildings, including the governor's palace and the Church of El Carmen, an example of extreme baroque, are constructed of a distinctive rose-colored stone, and the city's many domes and towers are covered in blue and white, or multi-colored, glazed tile. The region was one which the Aztecs had not conquered before the arrival of the Spaniards. These latter at first overlooked the riches of the area and merely erected here a series of strongholds to protect their lines of communication with Zacatecas where miners were active.

San Luis Potosí was founded about 1550, being named for King Louis IX of France (St. Louis); the "Potosí" was later added in allusion to the great mines in Bolivia whose name had become a synonym for fabulous wealth. The discovery of gold precipitated a rush in 1590, but operations were badly conducted, and for some 30 years after 1620 the town was almost completely abandoned in the belief that the mineral wealth of the surrounding region was exhausted. Further discoveries, particularly of silver, subsequently restored its prosperity. During the internal struggle against Maximilian, the city was for a time the provisional capital of the government of Benito Juárez. The so-called Plan of San Luis, opposing oppressive measures of the government of Porfirio Díaz and demanding reforms, which kindled the revolution of 1910, is given this title because it was drawn up in this city. Mining and the processing of ores is the greatest local industry; there are also cotton and woolen manufactures, breweries, and flour mills. A major rail and highway center, the most important communication link is with the port of Tampico, 200 miles to the east, on the Gulf of Mexico. Pop. (1950) 126,596.

SAN MARCOS, săn mär'kŭs, town, Texas, and Hays County seat; altitude 581 feet; on the San Marcos River; 30 miles southwest of Austin; on the Missouri Pacific; and Missouri, Kansas and Texas railroads. It is in an agricultural region, cotton, corn, and livestock being the chief products. It has a meat packing plant, a green feed dehydrating plant, cotton mills and processing plants, and federal and state fish hatcheries. Settled in 1845, it became the county seat upon the organization of the county in 1848, deriving its name from the older settlement of San Marcos de Neve, founded at the Camino Real river crossing in 1808 and abandoned in 1812. There is a monument to Gen. Edward Burleson, one of the founders of the town. The river furnishes a steady flow of clear, cold water, and there are many parks and caves along its banks. These natural attractions have made the town a popular pleasure resort. There are also hot springs within the town limits. Southwest Texas State Teachers College here includes a 40-acre demonstration farm specializing in dairying and poultry raising. There is also an Air Force base. Government is administered by a commission. Pop. (1950) 9,980.

SAN MARINO, săn mâ-rē'nō, city, California, in Los Angeles County, just southeast of Pasadena, altitude 567 feet; on the Pacific Electric Railway. Settled about 1852 and incorporated in 1913, it is a fashionable residential suburb and seat of the internationally known Huntington Library and Art Gallery. Government is by city council and mayor. Pop. (1950) 11,230.

SAN MARINO, sän mä-rē'nô, Europe, the smallest republic in the world and claiming to be the oldest state in Europe, comprises an area of 23 square miles, enclosed by Italian territory, among the terminating spurs of the Apennines near the Adriatic Coast. The government is peculiar and eminently democratic; its legislative power is vested in a Great Council of 60 members elected by popular vote, two of whom are appointed every six months to act as regents and a smaller Council of 12 members, divided into four congresses or departments. The executive authority is exercised by the regents. There is no public debt.

The town, standing on a mountainous crag 2,420 feet high, was built round a hermitage dating from 441 and is surrounded by a great wall with forts. But one road enters the town. Borgo is an aristocratic suburb at the foot of the hill. Silk is the principal manufacture. There are numerous massive and stately buildings including the governor's palace and six churches, one of which contains the tomb and statue of St. Marino; besides several schools, a museum, theater, town hall, and convents. Agriculture is the chief pursuit. Pop. (1936) 13,948.

SAN MARINO, Order of. See ORDERS AND DECORATIONS—*San Marino.*

SAN MARTIN, mär-tēn', **José de,** Argentine general and liberator: b. Yapeyú (now San Martín, Corrientes Province), Argentina, Feb. 25, 1778; d. Boulogne-sur-Mer, France, Aug. 17, 1850. Called the "Liberator of the South," he shares with Bolívar the glory of having expelled the Spanish power from continental South America. The son of a prominent Spanish official, at the age of nine he was sent to Madrid to obtain a military education. Commissioned second lieutenant in 1793, he rose through the grades to lieutenant colonel in 1808. He participated with distinction in campaigns on the Portuguese frontier, in Africa, and finally in the fighting that ensued on the Napoleonic invasion of the peninsula. In 1812, on the eve of his promotion to a colonelcy, he resigned his commission and embarked for his native land where he tendered his services to the revolutionary government.

On Feb. 3, 1813, San Martín attacked and defeated the Spanish forces under Gen. José Zavala at San Lorenzo on the Paraná. A year later (January 1814), finally promoted general, he superseded Gen. Manuel Belgrano (q.v.), in command of the Army of Upper Peru which had been nearly destroyed the previous autumn on the Bolivian plateau in the shattering defeats of Vilapugio and Ayohuma. Toward the end of the year he resigned this command and had himself appointed military governor of the region of Cuyo (now comprising the Argentine provinces of Mendoza, San Juan and San Luis) with headquarters at the city of Mendoza. Here he matured his great plan which was essentially to strike at the heart of the Spanish power in its

Peruvian citadel—not directly, as Belgrano had vainly attempted, but by first invading Chile and thence advancing northward by sea to Peru.

Toward the end of 1816 all was prepared for the campaign, but it was not until January 1817 that he set out from Mendoza at the head of a seasoned army of 4,000 men on the 17-day march across the Andes, traversing the Uspallata Pass. At Chacabuco, on February 12, he routed the hastily assembled Spanish forces. Then dividing his army he sent a part to destroy the Spanish nuclei in southern Chile and himself, heading the main body, invaded the central and northern areas. On March 17, 1818 he occupied Santiago, but two days later was badly defeated at Cancha Rayada. However, his decisive victory at the Maipo River on April 5 not only retrieved his fortunes but proved the death blow to the Spanish power in Chile.

Having declined the presidency of the liberated country in favor of Bernardo O'Higgins (q.v.), one of his chief lieutenants who had contributed importantly to the victory of Chacabuco, he now prepared the second phase of his plan, the construction of a fleet capable of dominating the Pacific and of convoying his army to Peru. On Aug. 23, 1820 he set sail from Valparaiso with an army of 4,500. Debarking at Parascas on September 8, he occupied the littoral as far as Pisco, some 150 miles south of Lima, the capital. Minor victories culminated in the battle of Pisco (December 6) in which the Spanish general and most of his artillery were captured. At the Conference of Puchanca (June 2, 1821) the new viceroy, J. de Salerna, offered terms which San Martín rejected, as they did not concede absolute independence. Resuming his advance, he occupied Lima on July 9. On the 28th he proclaimed Peru's independence and assumed the title of Protector. He expelled the majority of Spanish citizens, reformed the inhuman system of Indian labor exploitation, abolished slavery and initiated a system of annual redemptions of quotas of living slaves. He also founded the national library and instituted the Order of the Sun.

His celebrated meeting with Gen. Simón Bolívar at Guyaquil on July 26, 1822, a secret conference of the two liberators, has ever since been a theme of speculation. Hardly had the first Peruvian parliament assembled at Lima on September 20 than he resigned his protectorship and military command, and returned to Argentina, a simple citizen. In 1824 he sailed for France with his only daughter (he was now a widower). After completing her education and seeing her happily married he retired to Boulogne. In 1880 his remains were transported to Buenos Aires and reinterred in the cathedral. Argentina regards him as her greatest hero of the Revolution.

SAN MIGUEL, sän mē-gĕl′, city, El Salvador, capital of a department of the same name on the San Miguel River, at the foot of the volcano of San Miguel (7,120 feet), and 65 miles southeast of San Salvador. Founded in 1530, it is an active commercial and agricultural center noted for its annual fair. Indigo was once an important article of commerce. Chief products are coffee, sisal, and cattle. Pop. (1950) 26,831.

SAN MIGUEL DE ALLENDE, sän mē-gĕl′ dā ä-yān′dā, city, Mexico, in the State of Guanajuato, on the Mexican National Railroad, 34 miles north of Ceyala; named after the Mexican patriot, Gen. Ignacio Allende (1779–1811), who was born here. Wheat and beans are the chief agricultural products. Pop. (1950) 11,615.

SAN MINIATO, sän mē-nyä′tō, town, Italy, in Pisa Province, 21 miles west-southwest of Florence. The ancient cathedral dates from the 10th century and is adorned with many interesting monuments. Glass, olive oil, hats, and leather are manufactured. The town has considerable historical interest, especially as being the cradle of the Napoleon family. Pop. (1936) 3,082.

SAN NICOLAS, sän nē-kō-läs′, city, Argentina, capital of the San Nicolás district in northern Buenos Aires Province, situated at the head of the delta of the Parana River, 37 miles southeast of Rosario, with which it is connected by rail. It is an important railroad center, and a station for ocean steamers. It has manufactures of ceramics, textiles, and chemicals, large beef-packing houses, flour mills, and distilleries. The chief exports are wool and cattle products. Pop. (1947) 24,829.

SAN NICOLAS, Philippines. (1) Municipality, province of Ilocos Norte, on the Laoag River, three miles south of Laoag. It is on the coast highway. Pop. (1948) 15,567. (2) Municipality, province of Pangasinán, near the Agno River, 34 miles east of Lingayén. It is connected with Lingayén and also with towns to the south by highway. Pop. (1948) 18,218.

SAN PABLO, sän pä′vlō, **City of,** city, Philippines, Province of Laguna, Luzon; 45 miles south-southeast of Manila. It is the center of an area of volcanic elevations, with five small mountain lakes in the vicinity. There are indications of valuable mineral deposits. Pop. (1948) of metropolitan area, 50,435.

SAN PABLO BAY. See San Francisco Bay.

SAN PEDRO, săn pē′drō, formerly a city, California, in Los Angeles County, but annexed to Los Angeles in 1909 and since then an integral part of that city; altitude from sea level to 100 feet. A port of entry, its harbor, improved at great expense, is one of the best on the Pacific coast. Grains, fruits, and minerals are shipped; fish canning is a local industry. San Pedro has a fine civic center; the beach parks afford recreational facilities, and at Cabrillo Beach there is a museum with an aquarium and marine collections. Fort MacArthur, is situated here, on Point Fermin. The population, 1950, was about 40,000, and is included in the Los Angeles census count. See also Los Angeles.

SAN PEDRO, säm pā′thrō, town, Paraguay, capital of San Pedro Department, situated on a branch of the Paraguay River, about 90 miles north of Asunción. It is accessible for small steamers and exports maté. Pop. of district (1947) 11,483.

SAN PEDRO DE MACORIS, dā mä-kō-rēs′, city and province, Dominican Republic. (1) The city, capital of the similarly named province, is situated on the Caribbean Sea at the mouth of

the Higuamo River. The leading sugar center, it is one of the republic's chief export ports. Manufactures include tanning, alcohol distilling, clothing, candles, and soap. There is an international airport here.

(2) The province, which was organized in 1908, is situated in the southeastern part of the republic. Within its 520-square-miles area are the principal sugar plantations. Other commercial products are tropical fruit, timber, and cattle. Pop. (1950): city, 19,994; province, 64,214.

SAN RAFAEL, rȧ-fĕl′, city, California, and Marin County seat; altitude 25 feet; on San Pablo Strait; 17 miles north of San Francisco; on the Northwestern Pacific Railroad. It is the center of a stock-raising, dairying and general farming region, in which there is also a large suburban population. It has bus connection with San Francisco via the Golden Gate Bridge. Creamery products are processed, gloves and leather goods are made, and there are bottling works. Besides public and parochial schools, it has a Dominican college and several preparatory schools for boys. The city has a public library, an adequate equipment of parks and playgrounds, several recreation centers, a musical association; also, civic and service organizations. At the foot of Mt. Tamalpais, it has a scenic setting and a climate that attracts health seekers; near by are the Muir Woods and the Mt. Tamalpais State Park. A Spanish mission was established here early in the 19th century by Father Ventura Fortuni. Government is by mayor and council. Pop. (1950) 13,848.

SAN REMO, săn rā′mō or rē′mō, city, Italy, seaport in Imperici Province, 30 miles northeast of Nice, on the Mediterranean, in the famous Riviera district and a much frequented health and pleasure resort. The town is terraced, the ancient upper town with narrow and crooked streets lined with lofty buildings forming a strong contrast to the modern edifices of the lower town. Among its attractions are the cathedral, the Santurio della Guardia, the Santurio dell'Assunta with four handsome alabaster pillars and the Palazzo Borreo d'Olmo; the latter was ruined in World War II, and the city severly damaged. Important international conferences were held here in 1920. It was self-governed in 1170 and one of its bishops later sold it to Genoa. Pop. (1936) 23,963.

SAN SALVADOR, săn săl′vȧ-dôr, city, El Salvador, capital of the republic since 1840, situated near the base of the volcano San Salvador about 25 miles from the port of La Libertad on the Pacific Coast with which it has rail connection, in a pleasant valley at an altitude of 2,102 feet. The city is well laid out, having many pleasant parks and suburban resorts. It is subject to earthquakes and this fact has modified the methods of house construction, all the houses being low and surrounded by open areas. Its most noteworthy building is the Casa Blanca (white house), the residence of the President. Other notable structures are the library, university, and observatory. The city is an important industrial center; its manufactured products including soap, cigars, candles, cotton cloth, sugar, and spirits. It is also a thriving commercial center, doing a large trade in the products of the region, especially indigo and tobacco. Jorge de Alvarado founded San Salvador in 1525. From 1831 to 1839 it was the capital of the Central American Union. An earthquake all but destroyed it in 1854, another laid it low in 1873 and that of 1917, caused millions of dollars' worth of property losses. It has also suffered badly from destructive floods, the last occurring in 1934. Pop. (1950) 160,380.

SAN SEBASTIAN, săn sā-väs-tyän′, city, Spain, capital of the province of Guipúzcoa on the Bay of Biscay, 42 miles northwest of Pampeluna, and 10 miles from the French border; is a port and a natural and fortified stronghold. The principal buildings are the churches of Santa Maria and San Vicente, a nunnery, the courthouse, the schools of navigation, commerce, etc., theater, and hospitals. In the environs, on the Concha Bay, is Miramar, the royal palace. The industries of the town have greatly developed and include saw and flour mills, breweries, manufactures of preserves, soap, candles, glass, and paper, and there is considerable trade in English and French goods and in normal years, exports of wool, flour, wine, cutlery, firearms, copper-ore, and lead, and imports of sugar, silk, cotton, and linen goods, cocoa, machinery, and salted fish.

San Sebastian is Spain's most fashionable watering place, and was the summer residence of the royal family. Historically it has played an important role and has sustained several sieges, the most memorable in 1813, when Wellington with English and Portuguese forces took it by storm and burned it. Pop. (1940) 89,276.

SAN STEFANO, săn stĕf′ȧ-nō, **Treaty of,** a peace treaty of the Russo-Turkish War, concluded March 3, 1878, at San Stefano, a port on the Sea of Marmora. By its terms Bulgaria was to become a principality, extending from the Danube to the Aegean, and Rumania, Serbia, and Montenegro were recognized as independent. Russia was to receive a war indemnity of 300,000,000 rubles and the Dobruja, Kars, Batum, and other possessions. The congress held at Berlin, in June and July, 1878, greatly altered the provisions of this treaty, effecting peace on somewhat more moderate terms.

SAN VICENTE, săn bê-sān′tȧ, city, El Salvador, 27 miles east-southeast of the capital, lies almost central in the republic close to an extinct volcano of its own name. An attractive town, founded in 1635, its handsome church and a clock tower in the central park are the only notable buildings. A commercial and industrial center, its manufactures include textiles, footwear, and hats. From 1832 to 1839 it was the national capital. It has an annual fair. In 1936 it suffered a severe earthquake. Pop. (1950) 10,945.

SAN XAVIER DEL BAC, săn zā′vĭĕr dĕl bȧĸ, Spanish mission in Santa Cruz valley, eight miles south of Tucson, Arizona, established about 1687 by Father Eusebio Francisco Kino, Jesuit missionary to the Indians. The present church, erected about 1727, is a cruciform edifice with inner dimensions of 105 feet by 27 feet. Built of adobe with stone foundation and covering of fine cement, it faces south. The facade, highly ornamented with scroll work adorned with the arms of the Franciscan Order, is well preserved. Two towers, one unfinished, surmount the front. Over the main chapel is a massive dome of

splendid proportions and lightness. Several fine frescoes remain. The church's preservation is due to the devotion of the Papago Indians who took charge when the mission was secularized in 1827.

SAN'A or **SANAA**, sŏn-ä′, city, Yemen, capital of the kingdom, situated at an altitude of 7,250 feet in a well-watered valley about 90 miles northeast of the port of Hodeida. Of great antiquity, the city is massively built and is surrounded by a wall. Chief of its 48 mosques is the Jāmi' Masjid, a handsome structure erected on the site of a 6th century Christian church. San'a is an important trade center, dealing chiefly in coffee, dried fruit, and raisins. Sword blades and gold and silver jewelry are manufactured. The city was probably the center of an early Himyarite kingdom. In the Middle Ages it was ruled by Ethiopians. Subsequently it became the capital of an independent imamate, but in the 16th century, and again from 1872 to 1918, it was under Turkish control. Its importance was enhanced with the re-establishment of Yemen's independence after World War I. Pop. (est. 1950) 25,000.

SANBORN, Franklin Benjamin, American author and humanitarian: b. Hampton Falls, N. H, Dec. 15, 1831; d. Plainfield, N. J., Feb. 24, 1917. After being graduated from Harvard College in 1855, he became active in politics as the secretary of the Massachusetts Free-Soil Association, and he lent his aid to John Brown (q.v.) in the raid on Harpers Ferry, W. Va., after having vainly opposed the project. Throughout his active life, Sanborn was a journalist, having begun to contribute to the New Hampshire *Independent Democrat* in 1849, to the Boston *Transcript* in 1852, to the *Christian Register* in 1853, to the Boston *Traveller* in 1856, and to the Springfield *Republican* in 1856. From 1863 to 1867 he was an editor of the Boston *Commonwealth,* and from 1868 to 1914 of the Springfield *Republican.* For 30 years he edited the *American Journal of Social Science* (1867–1897), and he also contributed to the *Proceedings* of the Massachusetts Historical Society (1903–1915). In 1863 he became secretary of the Massachusetts State Board of Charities, the first established in the United States, and two years later he helped to organize the American Social Science Association, of which he was secretary until 1897. He was also among the founders of the National Conference of Charities (1865) and the National Prison Association (1871), and with Amos Bronson Alcott and William Torrey Harris (qq.v.) he established the Concord School of Philosophy (1879). His published works include *The Life and Letters of John Brown* (1885); biographies of Henry David Thoreau (1882), Samuel Gridley Howe (1891), Alcott (with Harris, 1893), Pliny Earle (1898), Ralph Waldo Emerson (1901), and Nathaniel Hawthorne (1908); *The Personality of Thoreau* (1902); *The Personality of Emerson* (1903); *Bronson Alcott at . . . Fruitlands, New England* (1908); *Hawthorne and His Friends* (1908); *Recollections of Seventy Years* (1909); *Sixty Years in Concord* (1916); and *The Life of Henry David Thoreau* (1917). He also edited works by the younger William Ellery Channing, Theodore Parker, and Thoreau.

SANBORN, Walter Henry, American jurist: b. Epsom, N. H., Oct. 19, 1845; d. St. Paul, Minn., May 10, 1928. He was graduated from Dartmouth College in 1867, taught school, and then studied law, being admitted to the Minnesota bar in 1871. He practiced law in St. Paul until 1892, when he was appointed a judge of the Circuit Court of the United States for the 8th Circuit; in 1903 he became presiding judge of the circuit and served in this position until his death. Sanborn was particularly interested in the law of personal injury. He also conducted the receiverships of several railroads: Union Pacific (1893–1898); Chicago Great Western (1908–1909); St. Louis-San Francisco (1913–1914); Denver & Rio Grande Western (1918–1919).

SANCHEZ CERRO, sän'chās sĕr'rō, **Luis M.,** Peruvian army officer and political leader: b. Piura, Aug. 12, 1889; d. Lima, April 30, 1933. Of Indian parentage, he had one of the most turbulent careers in South American history. He first took part in a revolution in 1914. In the following year he served as military attaché in Washington and then returned to Peru for military duty in various army posts. He led an uprising in 1922 and was imprisoned. On his release he was sent to Europe on a military mission and during his stay there served in the Spanish and Italian armies. In 1929 he received command of a battalion in Arequipa and in August 1930 led a revolt there against President Augusto Bernardino Leguía y Salcedo (q.v.), forcing his resignation. Sánchez Cerro then became provisional president, but a naval junta compelled him to resign in March 1931. Elected to the presidency later in the year, he ruled as a dictator. He was assassinated.

SANCHEZ DE BUSTAMANTE Y SIRVEN, sän'chās thā bōōs-tä-män-tā ē sēr-vān′, **Antonio,** Cuban jurist: b. Havana, April 13, 1865; d. there, Aug. 24, 1951. Graduating in law from the University of Havana, in 1884 he won by competitive examination the university's professorship of international law. While continuing to occupy this chair throughout his career, he took a prominent part in public affairs both in his native country and abroad. With the creation of the Republic of Cuba in 1902, he was elected senator and served until 1918. Meanwhile, in 1907, he served as Cuban delegate plenipotentiary at the Second International Peace Conference at The Hague. In 1919 he represented Cuba at the Paris Peace Conference, and two years later he was appointed a judge at the Permanent Court of International Justice. His numerous works pertaining to international law include *Proyecto de código de dereche internacional privado* (*A Project for a Code of International Private Law,* 1925).

SANCHI, sän'chĭ, village, Bhopal, India, situated about 23 miles northeast of the city of Bhopal. It is celebrated for its ancient Buddhist stupas or memorial mounds, some of which may date back to the reign of Emperor Aśoka (c.274–237 B.C.). Stupa No. 1, 54 feet high and 120 feet in diameter, is surrounded by a stone railing with four gateways, called torana, carved with scenes from the Buddha's life and Buddhist symbols. The stupa itself is a hemisphere of stone and brick crowned with a platform. Dating from the Gupta period (c.318–500 A.D.) is a rectangular Hindu temple.

SANCHO, săn'shōō, the name of two Portuguese kings of the Burgundian dynasty.

Sancho I (known as the City-Builder, 1154–1211) succeeded his father, Alfonso I, in 1185. Most of his reign was spent in wars with the Moslems, from whom he wrested new territories on which he settled Portuguese colonists. He also established military orders and built roads and cities.

Sancho II (1208–1248), grandson of Sancho I and son of Alfonso II, ascended the throne of Portugal in 1223. His reign was marked by struggles with the clergy and the nobility, and in 1245 he was deposed by Pope Innocent IV in favor of his brother Alfonso, with whom he waged war from 1246 until his death.

SANCHO PANZA, săng'kō păn'zà (Span. săn'chō pän'thä), the faithful squire in Miguel de Cervantes Saavedra's *Don Quixote* (q.v.), who accompanies his master upon his travels but who takes a prosaic view of the incidents colored and distorted by his master's illusions. He is famous for his shrewd proverbs.

SANCHUNIATHON, săn-kū-nī'à-thŏn, or **SANCHONIATHON,** reputed author of a history of Phoenicia and Egypt, entitled *Phoinikika,* and published by the grammarian Philo Byblius (q.v.) as a Greek translation from the Phoenician. According to Philo, Sanchuniathon was a native of Berytus (modern Beirut) and lived during the reign of the Assyrian queen Semiramis. Other writers describe him as a Phoenician living before the Trojan War. Some critics maintain that no such person ever existed and that the work attributed to him was written by Philo himself or, as others think, by Eusebius of Caesarea (q.v.). A fragment of the work is preserved in Eusebius' *Praeparatorio Evangelica,* in which the author quoted Sanchuniathon as evidence in corroboration of certain Biblical statements assailed by Porphyry (q.v.). The Greek fragments still extant were published by J. C. Orelli in 1826 and by C. Müller in 1849, and occasioned keen controversy. The conclusion at which Ernest Renan (q.v.) arrived is that a Phoenician at the time of the Seleucidae (312–64 B.C.), whose real or feigned name was Sanchuniathon, wrote in Phoenician a work on history and mythology, and that Philo Byblius later made a free translation of it.

SANCROFT, săn'krôft, **William,** English prelate: b. Fressingfield, Suffolk, Jan. 30, 1617; d. there, Nov. 24, 1693. He was graduated from Cambridge University in 1637. In 1663 he was appointed dean of York, and in the following year became dean of St. Paul's Cathedral, London, whose restoration he furthered. In 1678 he was consecrated archbishop of Canterbury, but in 1688, on presenting with six bishops a petition against the reading of James II's Declaration of Indulgence (q.v.), was committed to the Tower of London for trial. He was acquitted, but after the accession of William and Mary he refused to take the oath of allegiance to the new sovereigns and was deprived of his see in 1690. In 1691 he retired to Fressingfield, where he remained in seclusion until his death.

SANCTI SPIRITUS, sănk'tē spē'rē-tōōs, municipality and town, Cuba, situated in Las Villas province, 45 miles southeast of Santa Clara. It was founded in 1514, being one of the seven original Cuban towns established by Diego de Velásquez. The town contains examples of colonial architecture. The center of an agricultural region, it has an active trade in sugar and cattle. Pop. (1943) 14,164.

SANCTIFICATION, a theological term for which Protestant and Roman Catholic definitions differ widely. For Protestants, sanctification is distinct and separable from justification; for Roman Catholic theologians, the two are inseparable and hardly distinguishable from each other. John Calvin (*Institutes,* book 3, chap. 2), the Lutheran *Solida Repetitio et Declaratio* (Art. 3), and Martin Luther and Philipp Melanchthon teach that justification is simply a judicial act of God's free grace liberating the sinner from condemnation, while original sin persists in man's nature, to be weakened, not extirpated, by the communication of the Holy Spirit: thus sanctification is a process which begins after justification. Justification in the teaching of the Roman Catholic Church is defined by the Council of Trent (Session 6, chap. 7) to be "not only remission of sins but also sanctification and renovation of the inner man through the free acceptance of grace and gifts"; and in another place (Session 6, chap. 5) the council teaches that "justification is a transference out of that state in which man is born a son of Adam, into the state of grace and adoption of the children of God, by the Second Adam, Jesus Christ, our Saviour." From this it appears that in Roman Catholic theology sanctification is inseparable from justification, which depends upon it, and that "the sinner is justified and sanctified by the one same act" (Giovanni Perrone, *Praelectiones Theologicae,* tr. *de Gratia,* part 2, chap. 1).

SANCTORIUS, săngk-tō'rĭ-ŭs (Latin name of Santorio Santorio), Italian physician: b. Capodistria, 1561; d. Venice, Feb. 24, 1636. From 1611 to 1624 he was professor of medicine at the University of Padova (Padua), and from 1629 until his death he studied in Venice. He conducted a series of experiments on insensible perspiration, and was responsible for several inventions, including a clinical thermometer and an instrument for measuring the pulse.

SANCTUARY, Privilege of, is the exemption of certain places, and of criminals taking refuge in them, from the ordinary operation of the law of arrest. It is also called the right of asylum (q.v.). The six cities of refuge mentioned in the Book of Numbers, chapter 35, were to afford the privilege of sanctuary to "every one that killeth any person unawares." That institution in Israel and the institution of asylum among the Greeks and Romans gave rise to the similar institution of sanctuary in Christendom. The privilege of sanctuary was accorded certain churches by the Roman emperors of the late 4th century; throughout the Middle Ages it was recognized as attaching to all churches. In England a person accused of felony might take refuge in a sanctuary and then, within 40 days, take before a coroner an oath of abjuration entailing perpetual banishment to a foreign Christian country. Statutes of the reign of Henry VIII greatly curtailed the privilege of sanctuary, the number of cities retaining a charter from the king being reduced to seven. Such exemption was abolished throughout the kingdom altogether by the statute of 21 James I, in 1623. But the privilege of sanctuary

against civil process still persisted, attaching to certain places, parts or supposed parts of royal palaces, as Whitefriars (("Alsatia"), the Savoy, and the Mint: these were secure refuges for debtors till 1697, when their privilege was abolished by the statute 8 and 9 of William III. All religious sanctuaries in Scotland were done away at the Reformation; but the Abbey and Palace of Holy Rood with its precincts, including the hill of Arthur's Seat and the Queen's Park still afforded protection against civil process for debt; and the privilege still exists in form, though in fact it never has to be invoked since the abolition in 1880 of imprisonment for debt. It was the abuses to which this system gave rise, as tending to defeat the ends of justice, that led to its abolition in all Christian countries. A modern form of the system is extraterritoriality (q.v.).

SANCTUS, or **TERSANCTUS**, a passage in the liturgical service of the Catholic Church, eastern and western, and in part still retained in the Anglican Book of Common Prayer: it is the final passage of that part of the liturgy (and of the Anglican communion service) which is called the Preface. The name Sanctus or Tersanctus (thrice holy) is given to it because of the word sanctus (holy) thrice repeated, with which it opens. *Sanctus, sanctus, sanctus, Dominus Deus Sabaoth,* etc., that is, "Holy, holy, holy, Lord God of Hosts, heaven and earth are full of Thy glory. Hosanna in the highest. Blessed He that cometh in the name of the Lord. Hosanna in the highest." In the prayer book only the first clause is used, followed by "Glory be to Thee, O Lord Most High. Amen."

SAND, sänd, **George,** assumed name of Lucile-Amandine-Aurore Dupin, French novelist: b. Paris, 1 July 1804; d. Nohant, in Berry, 8 June 1876. Her father's mother was an illegitimate daughter of the noted Maurice de Saxe, son of Augustus II, king of Poland, and was herself widow of the Comte de Horn, bastard of Louis XV, when she married George Sand's grandfather, Dupin de Francueil. George Sand's aristocratic, though clouded, paternal ancestry was mated with plebeian blood, her mother being a Parisian *modiste.* She was brought up chiefly in the country at her grandmother's home in Nohant, but was partly educated at the Couvent des Anglaises in Paris. Her youth was dreamy and emotional. At 18 she was married to the Baron Casimir Dudevant, but the marriage proved unhappy, and resulted, after some years, in a separation. In 1831 she began a Bohemian career in Paris, associating with young literary men and students and herself often wearing masculine costume. The first important one of her many *liaisons,* so often with younger men, was with Jules Sandeau. They wrote at first under the name of Jules Sand, but soon she composed her own novels, signing them George Sand. Her first independent book was 'Indiana' (1832). George Sand's extraordinarily numerous novels are usually divided into four chronological groups. The earliest ones, in particular, which reflect her emotional discipleship of Rousseau and of the Madame de Staël of 'Delphine' and of 'Corinne,' as well as her own domestic infelicities, aroused a storm of criticism. Her hostility to accepted social conventions, her attacks on the tyranny of marriage, her portrayal of the misunderstood and unappreciated woman or *femme incomprise,* aroused the tumult of indignation which greeted 'Valentine,' 'Lélia' and 'Jacques' as expressions of over-emancipated feminism. In 1833, before the appearance of 'Jacques,' began the madly romantic love-affair with Alfred de Musset, six years her junior, and already a noted poet. Together they went to Italy, but within a few weeks, by the time of their arrival in Venice, dissension had begun. This was accentuated by the successive illnesses of George Sand and of Musset and his jealousy of the handsome young Italian doctor, Pietro Pagello, who was called in to treat him. Musset tried first a rôle of magnanimous forgiveness and returned to France, leaving George Sand with Pagello. She, however, soon repented of the change and, after stormy efforts at a renewal of the old intimacy, the final break between George Sand and Musset came in 1835. As a result of romantic literary "exhibitionism" this affair was the source of much material, Musset's 'Confession d'un enfant du siècle' and many of his finest poems, George Sand's 'Elle et lui,' not to mention documents by relatives or partisans of one or the other principal. Roughly speaking, George Sand's second literary period now begins. She discards somewhat the portrayal in her novels of beautiful men and women with obstreperous souls, and comes under the influence of people like the musician Chopin, or advocates of social reform and humanitarianism such as Michel (de Bourges), Lamennais and Pierre Leroux. Down to about the middle of the 19th century her novels, while still touched with romantic passion, tend to present in sentimental and somewhat fantastic fiction plans for the reconstruction of society and mating of classes, or visions of a world happily organized in justice and sympathy. 'Mauprat' has the excellence of a well-told story, but more characteristic works of this period are 'Spiridion,' 'Les Sept cordes de la lyre,' 'Consuelo,' 'La Comtesse de Rudolstadt,' 'Le Meunier d'Augibault' and 'Le Péché de monsieur Antoine.' In 1838–39 she made a journey to Majorca with the consumptive Chopin, a trip commemorated in 'Un hiver à Majorque.' The intimacy continued for several years longer and Chopin appears in disguise in 'Lucrezia Floriani.' At the beginning of the republic of 1848, George Sand greeted the new régime with joy, wrote 'Lettres au peuple,' collaborated with Ledru-Rollin, but soon became disheartened at popular excesses and ceased her political propaganda. Meanwhile she had gradually turned to the composition of novels of a third category. As early as 1844 in 'Jeanne' she had tried to combine the mystical spirit with a story of rustic life; then devoting herself to the idealized portrayal of the country, especially of her own province, she composed the pastoral idylls which are her works most read to-day 'La mare au diable,' 'La petite Fadette,' 'François le champi,' 'Les maîtres sonneurs.' 'Les beaux messieurs de Bois-Doré' is an incursion into the literary pastoral under the influence of Honoré d'Urfé's 'Astrée.' Finally, during the last period, beginning about 1860, she wrote sentimental stories, but of a more conventional character and free from the impractical utopianism

or even impossible fantasy which had characterized many of her earlier works. To this class belong *Jean de la Roche* and *Le Marquis de Villemer* (1861). This last work won even greater success when dramatized with the help of the younger Dumas, who gave it a wit and vigor which the diffuseness of George Sand herself could never achieve. Her style was, indeed, extremely diffuse. Her facility of composition was extraordinary and her plots came as she put pen to paper. She could write or stop writing at any hour of the day or night. Thus we can understand the abundance of her works, of which only a few can here be mentioned. Her influence has passed away, and she has long ceased to be thought of as revolutionary, but her books will always be remembered as both the reflection and inspiration of utopian visions of her age; and her intimacies with so many famous men give an interest to her in addition to her own merits. Her *Histoire de ma vie* of 1855 is of interest in this respect and of much psychological value. See also ELLE ET LUI.

(Vladimir Karenin), *George Sand, sa vie et ses oeuvres, 1804–1876,* 4 vols. (Paris 1899–1926); James, H., "George Sand: The New Life," *North American Review,* vol. 174, pp. 536-554; Rocheblave, S., *George Sand et sa fille* (Paris 1905); Doumic, R., *George Sand,* tr. by A. Hallard (London 1910); Spoelberch de Lovenjoul, C. V. M. A., *Etude bibliographique sur les oeuvres de George Sand,* new ed. (Paris 1914); Maurras, C. M. P., *Les amants de Venise: George Sand et Musset* (Paris 1916); Vincent, L., *George Sand et le Berry* (Paris 1919); Seillière, E. A. A. L., *George Sand* (Paris 1920); Schermerhorn, E. W., *The Seven Strings of the Lyre: The Romantic Life of George Sand, 1804–1876* (New York 1932); Charpentier, J., *George Sand* (Paris 1936); Seyd, F., *Romantic Rebel: The Life and Times of George Sand* (New York 1940); Winwar, F., *The Life of the Heart: George Sand and Her Times* (New York 1945). A complete edition of her works appeared in Paris, 1862–1883, and in Philadelphia, Pa., 1901; many subsequent editions followed.

SAND, name of two Pacific islands, possessions of the United States. (1) The more westerly of the two islands of the atoll Midway (q.v.) is named Sand; it is 2 miles long, and at the northern end 1 mile in breadth. It contains a cable station and lighthouse, and in 1935 Pan American Airways constructed on the island a hotel and other facilities for its transpacific services. (2) One of the two small islets within the reef surrounding Johnston Island (q.v.) also bears the name of Sand; it lies about a mile northeast of Johnston proper.

SAND, a mass of unconsolidated mineral grains of practically uniform size, large enough to be detected with the unaided eye, but too small for the grains to be readily picked up by hand. In composition, sand varies greatly, from grains of pure silica or pure calcium carbonate to a complex mixture of many minerals. Pure silicious sand is in most cases primarily derived from the disintegration of igneous or other rocks, containing silica, which remains behind after the removal of other minerals more subject to chemical disintegration. The separation is usually accomplished by the waves of the seashore, and in general it may be said that the longer the sands are subject to wave activity, the more complete will be the sorting process. Calcareous sands result mostly from the grinding up by the waves of shells, corals, and the like, or of limestone beds; and may be of all degrees of purity. The so-called aeolian limestone of the Bermudas consists of calcareous shell sand which has drifted into great dunes and later been consolidated. Drifting dunes of gypsum are known in New Mexico. Granite, when broken down by mechanical agencies, forms a quartz-feldspar sand known as feldspathic sand, or arkose sand. Basic rocks, similarly disintegrated, form ferromagnesian or gray wacke sand. On the shore, the sands are kept firm by the water held between the grains by capillary attraction. If this evaporates, the sands are driven inland by the winds, piled up into sand dunes and often convert extensive districts into sand deserts. (See DESERT). River sands derived from crystalline or metamorphic rocks often carry gold or other precious metals in the forms of grains or nuggets. Auriferous sand constitutes the source of much gold, in placer deposits. Sands washed by temporary streams from glaciers or glacial moraines and deposited in front of the ice, build up sand-plains, which are the chief source of sands and gravels in glaciated regions. (See GLACIAL DEPOSITS). The ordinary grades of sand are much used in the building trades for mortar and concrete; very pure quartz is largely used in glass manufacture; and various other grades of sand are employed for a very large number of purposes, including water filtration, the making of molds in foundries, and manufacture of sandpaper and scouring soaps. See also MINERAL PRODUCTION OF THE UNITED STATES.

SAND BADGER, or **HOG BADGER,** a small East Indian badger (*Arctonyx collaris*), which gets its first name from its customary station and burrowing habits, and the second from its piglike rooting snout; it is also known as balisaur. Its general habits are like those of its type. See also BADGER.

SAND CRACK, a crack or fissure in the hoof of a horse, due to a disease generally referred to the coronet, sometimes to the laminae covering the pedal bone, specifically to the membrane which secretes an essential adhesive substance entering into the constitution of the hoof. The crack generally extends from the coronet toward the sole. In the fore feet the inner quarters are most frequently attacked; in the hind feet, the toes. There are various forms of sand crack, the most common of them being usually called quarter crack. See HOOF.

SAND CREEK MASSACRE, a sanguinary attack by Col. John M. Chivington on Nov. 29, 1864, on a Cheyenne and Arapaho camp in Kiowa County, Colorado. The Indian commissioner had sent about 400 Indians of the tribes above named to a camp at Sand Creek. The military desired to cow the Indians by heavy punishment for their atrocities against the whites, while the Indian Department earnestly sought to mediate among the white settlers, the military and the aborigines. Chivington slaughtered 131 men, women and children, and a long and costly struggle ensued. Not until 1871 did the Cheyenne put aside the sword and consent to go on a reservation.

SAND DARTER, a genus (*Ammocrypta*) of small fresh-water fishes (see DARTER), whose species, especially *A. pellucida,* common in the mid-continent streams, buries itself in the sandy bottom with astonishing quickness and completeness.

SAND DOLLAR, a name given along the New England coast to one of the flat, dollar-shaped villose sea urchins of the genus *Echinarachnius;* several species are to be found on sandy bottom near shore and others are numerous in greater depths, affording some food to cod, flounders and other bottom-feeding fishes.

SAND DUNE. See DUNE.

SAND GROUSE, a family (Pteroclidae) of birds related, on the one hand, to the pigeons (Columbae), and, on the other, to the grouse (Gallinae). The sand grouse inhabit the plains and sandy deserts of the tropical regions and countries of the Eastern Hemisphere. The legs are longer than in grouse, the tail and wings pointed, and the general aspect dovelike. The best-known species are the *Pterocles alchata* and the *P. arenaria.* Both of these birds occur in southern Europe. They fly well and feed upon seeds and insects. The eggs are four or five in number and the nest is constructed in a rough fashion on the ground. Other species inhabit Asia and Africa. Pallas' sand grouse has been made the type of a different genus, *Syrrhaptes,* in which the tarsi are feathered and the anterior toes united in a common integument, as well as feathered to the claws, the hallux absent. It is a native of the plains of central Asia, where it occurs in vast numbers. Much interest was excited in 1863 and again in 1888 by great numbers of these birds invading Europe. They crossed the North Sea and were found in considerable numbers throughout Britain, and as far north as the Faeroe Islands. They even bred in Great Britain in one or two cases. Smaller invasions occurred in other years. Sand grouse are classed as game birds in the regions in which they occur and especially in India.

SAND-HILL CRANE. See CRANE.

SAND HOPPER. See AMPHIPODA.

SAND LAUNCE, or **SAND EEL,** a small teleost fish of the family Ammodytidae, which is represented on all the colder coasts of the world by some 10 species, but whose relationships are undetermined. They have the shape of eels, from 6 to 12 inches long, according to species, but are distinguished by the fact that the tail fin is well developed and is distinct from the dorsal and anal fins, while it is also forked at its extremity. The skin is silvery in appearance, but destitute of true scales. The lateral line runs along the side of the back. The dorsal fin begins just behind the head and extends nearly to the caudal fin. The anal fin extends to about one third or one half the length of the body. Several species are to be found on both coasts of North America.

SAND MARTIN. See BANK SWALLOW.

SAND PIKE, a fish, the sauger (q.v.).

SAND PIPE, cylindrical hollows, often of great depth and filled with sand and gravel. They are characteristic of all rocks, but have been particularly described from the white chalk of England and France, where Sir Charles Lyell found them up to 12 feet in diameter and over 60 feet deep. They are analogous to potholes formed along mountain streams through the gyrating motion of the water in an eddy. The holes are cut by loose rocks kept in constant circular motion by the water. Analogous hollows, termed glacial potholes or moulins, are also found where a superglacial or englacial stream plunges down a crevasse and sets the rocks at the bottom of the crevasse in motion, thus often cutting to great depths. These holes or pipes are afterward filled with sand and gravel either by the stream or upon the melting of the ice. These holes have also been attributed by Lyell to the chemical action of water charged with carbonic acid gas, which was derived from the decaying vegetation of the soil through which the water passed.

Similar deposits of sand, generally solidified into sandstones or quartzites, are not infrequently found in the older rocks of all countries. These are generally masses in the form of dikes penetrating sedimentary or crystalline rocks, often to a great depth. Many of these sandstone dikes were formed at a very early period in the earth's history, when the fissures were formed either through solution, atmospheric disintegration or in some cases through earthquake shocks.

SAND SHARK, a small voracious shark of the family Carchariidae, which is mainly extinct, the three existing species occurring chiefly in the Atlantic, where *Carcharias littoralis* (J. and E.) occurs numerously on the American coast between Cape Cod and Cape Hatteras; it is doubtfully different from the one frequently seen along the European coast. These sharks are similar to the mackerel sharks (*Lanuridae*) and reach a length of five or six feet.

SAND SUCKER, a local name in California for a familiar fish, the whiting (q.v.).

SAND WASP, any of many solitary wasps which burrow in sand or loose earth and leave their eggs there in well-provisioned cells. There are numerous species in all parts of the world. See WASPS.

SAND WHEEL. The removal of fine waste, sand and slime from mills where ores are crushed and concentrated may call for the use of special devices, one of which is the sand wheel. If the mill stands on a hillside such refuse can usually be washed down troughs, called launders, to lower ground where it may accumulate. If the mill site is level land and the mill handles a large amount of rock then the refuse must be lifted that it may flow to a settling place. Various types of elevators and conveyors are used for this purpose. The sand wheel, though bulky, has the merits of simplicity and few wearing parts, and is simply a development of the water wheels used since ancient times for irrigation purposes in Eastern countries. At ore mills in many parts of the world sand wheels may be seen, notably at the great gold mines of the Transvaal, where some are over 50 feet in diameter.

A giant sand wheel, one of the largest ever erected, was built to handle the mingled sand and water from the great crushing and concentrating plant of the Calumet and Hecla Mining Company at Lake Linden, Mich. This mill treated an

enormous tonnage of copper-bearing rock, and the resulting waste was run into the lake where the accumulations of years covered many acres. The large wheel was erected that the waste might be lifted higher to flow over the old deposits. It was 65 feet in diameter, elevated the water and waste to a height of 50 feet and had a capacity of 75,000,000 gallons in 24 hours.

It was constructed by the Robert Pool and Son Company of Baltimore, Md. In the general principles of design involved the wheel did not differ materially from other segmental iron and steel wheels of large diameter, but was of interest from its size. It was driven by an electric motor of 750 horse power through a pinion wheel 37 inches in diameter having a shaft carrying a wheel that engaged a pinion on the motor shaft. The wheel dipped into a pit 100 feet long, 12 feet wide and 30 feet deep that received the sand and water. From this pit the refuse was scooped up and discharged into a launder at an elevation of about 50 feet. For protection against the elements, the winter climate being severe, the wheel was housed in a building high enough to cover it entirely.

SANDAL, a kind of covering for the feet used among the ancient Jews, Greeks and Romans and which we find to be of the highest antiquity. It usually consisted of leather or of a thick cork sole covered above and beneath with leather and neatly stitched on the edge. It left the upper part of the foot bare and was fastened on by means of straps, crossed over and wound around the ankle. In later times sandals became articles of much luxury, being made of gold, silver or other precious material and beautifully ornamented. See Boots and Shoes.

SANDALWOOD, a fragrant wood furnished by the genera *Santalum* and *Fusanus,* of the family Santalaceae. The principal source of the genuine sandalwood is a small evergreen tree (*Santalum album*), partly parasitic in growth, with opposite entire leaves and thyrses of yellowish flowers which resemble those of the privet. It grows wild and is now also cultivated in the dry regions of southern India and on the mountains of the Malay Archipelago.

The trees are mature in about 20 years and are then cut down, the trunk then being about a foot in diameter. The felled trunks are left on the ground in order that the white ants may eat off the useless sapwood, the insects leaving the aromatic heart wood untouched. When thus cleaned the sandalwood is sawn into small pieces and then dried slowly to improve the fragrance and to prevent splitting. This heart wood is yellowish-brown, very hard and close-grained, and made odorous by the presence of an oil which is still more abundant in the root. The oil is distilled from the roots and chips and is largely used as a perfume, especially in India, and also as a medicine; it is said to have replaced copaiba in the treatment of diseases of the mucous membrane. The heart wood is used especially by the Chinese for carvings, fans, boxes, and so forth, not only because of its lasting perfume, but because it repels insects; it was employed in India during the 5th century at least and is still a necessary article in various Buddhistic ceremonies, in cremations, for caste marks, and for incense. It was probably one of the ingredients of the Levitical incense and the almug of Scripture. Sandalwood was originally obtained only in India, but other species (*S. freycinetianum* and *S. pyrularium*) were found in Hawaii and in other Pacific islands and led to a trade so ruthless that many deaths ensued and the supply of trees was nearly exhausted.

A small leguminous tree (*Pterocarpus santalinus*) furnishes the red sandalwood (or sanderswood), having a heart wood, first dark red, but becoming brownish on exposure, and used as a dyestuff, giving reddish-brown hues to woolens. It was employed in powdered form to color foods and was considered by Hindu physicians to be astringent and tonic. Various inferior qualities of sandalwood are obtained from *Bucida capitata,* the *Myoporaceae* and other trees.

SANDARAC, a friable, dry, almost transparent resin, which is imported from Morocco, in pale yellow tears, somewhat harder than mastic. It exudes from the bark of the small coniferous sandarac tree, also called the tear tree (*Callitris quadrivalvis*), a native of the north of Africa and a characteristic tree of the Atlas Mountains. The Australian species of *Callitris* furnish a similar resin. Sandarac is not used in great quantity. Although a medicine in high repute at one time and later used for a pounce powder, to prevent ink from spreading when writing over an erasure, its chief employment now is in the making of varnishes, the same as mastic. The mahogany-colored wood of the sandarac tree is highly balsamic, extremely durable and is utilized by cabinetmakers and mosque builders; it is said to have brought fabulous prices in Pliny's time.

SANDBAGS, in fortification and other military operations, are coarse canvas bags, about 30 inches long and 15 inches thick, filled with sand, and much used in cases where cover for troops is required to be speedily obtained.

SANDBLAST, an apparatus for the use of sand as a blast in cutting and engraving glass, stone, metal, and the like. The sand is blown against the article to be cut by a blast of air or steam, which quickly cuts away the unprotected surface, leaving in relief that part of the surface guarded from the effect of the sand by patterns of iron or other substance harder than that which it is desired to efface. The sand blast is much used to clean the exterior of stone buildings.

SANDBUR, either of two very dissimilar plants. One, also called the buffalo bur (*Solanum rostratum*), is a weed, native to the western plains of the United States; it is the original food of the potato bug, and has worked eastward, its seeds having traveled at first, perhaps, in the hair of the bison. The sandbur is an annual, densely pubescent, and prickle-armed plant, having the characteristic star-shaped flowers of the potato, although yellow in hue. The calyx is densely prickly, and surrounds the berry in fruit, the prickles becoming as long as the berry itself.

A grass (*Cenchrus tribuloides*) is also called sandbur, and is commonly found near seashores or in waste land, in the eastern half of the United States, where it is becoming a noxious weed in some places. It has robust stems partly decumbent from an annual root, and branches freely. The leaves are flat, and the floral involucres are crowded in terminal spikes on a rough stem, and form spiny burs, which stick easily to clothing or

the hair of animals, and so may be carried long distances.

SANDBURG, Carl, American author: b. Galesburg, Ill., Jan. 6, 1878. Winner (in 1940) of the 1939 Pulitzer Prize in history for his monumental four-volume *Abraham Lincoln: The War Years,* he is known not only as one of America's most outstanding biographers, but also as the "laureate of industrial America." His poetry, written in popular language and enriched with a liberal sprinkling of folklore and idiomatic expression, was written both for and about the people of America, particularly the workingman. His subjects were derived primarily from the Middle Western environment he knew so well; and throughout his work he indicates a consistent sympathy with the downtrodden without indulging in sentimentality. The rhythm of his poetry is peculiarly his own, as developed in his use of the broken or extended line instead of the more conventional meters. While his use of slang and the earthy idioms of the street and factory shocked many of his early readers, even the harshest of his poetry emerges with a realistic beauty of its own in tempo with the people and the history it portrays.

The son of poor Swedish immigrants, Sandburg was ideally suited to become the biographer of Lincoln. He received very little schooling and performed a variety of odd jobs in his early years, working as driver of a milk wagon, barbershop porter, bricklayer, theatrical scene shifter, truck handler in a brickyard, and turner apprentice in a pottery—all of which brought him in contact with the people and scenes he was to describe later. At the age of 17 he went to Kansas where he worked as a wheat harvester and dish washer before returning to Galesburg to become apprenticed to a house painter. In the Spanish-American War he served several months (1898) in the Sixth Illinois Volunteers. Then, having been persuaded by a friend to supplement his meager education, he worked his way through Lombard College (1898–1902) without graduating, although the college awarded him a Litt.D. degree in 1928. After more odd jobs, he went to Milwaukee where he was district organizer for the Wisconsin Socialist-Democratic Party for a year, secretary to the mayor (1910–1912), and associate editor of *System Magazine* (1913). Eventually he worked his way into the field of journalism, becoming editorial writer for the Chicago *Daily News.* Thereafter he turned seriously to his writing, lectured in various universities, and began a series of tours throughout the country singing folksongs to the accompaniment of his guitar. He was elected to the American Academy of Arts and Letters in 1940. Together, his *Abraham Lincoln: The War Years* (1939) and his 2-volume *Abraham Lincoln: The Prairie Years* (1926) comprise one of the greatest historical works ever written about an American. To these was added his *Lincoln Collector* in 1948. Another Civil War volume, *Storm Over the Land,* appeared in 1942; and in 1943, *Home Front Memo* was concerned with World War II. His poetry includes *In Reckless Ecstasy* (1904), *Chicago Poems* (1915), *Corn Huskers* (1918), *Smoke and Steel* (1920), *Slabs of the Sunburnt West* (1922), *Selected Poems,* edited by Rebecca West (1926), *Good Morning, America* (1928), and *The People, Yes* (1936), the latter often called his greatest poetic work and one which he himself described as "my footnote to the last words of the Gettysburg Address." He also wrote *Rootabaga Stories* (1922), *Rootabaga Pigeons* (1923), *Potato Face* (1930), and *Early Moon* (1930) for children; *The Chicago Race Riots* (1919); *The American Songbag* (1927), a collection of ballads and songs largely contributed by his audiences; *Steichen the Photographer* (1929), a biography; and *Remembrance Rock* (1948), a historical novel. He was co-author with Paul M. Angle of *Mary Lincoln, Wife and Widow* (1932), and with Frederick Hill Meserve of *The Photographs of Abraham Lincoln* (1944).

Consult Hansen, Harry, *Carl Sandburg, the Man and His Work* (Little Blue Books No. 814, Girard, Kans., 1925); Detzer, K., *Carl Sandburg* (New York 1941).

SANDBY, Paul, English painter: b. Nottingham, 1725; d. London, Nov. 9, 1809. He was one of the earliest painters in water colors in England, and has been styled "the father of the water color school," but began life as a teacher of boys and resolved on an artistic career only after his appointment to the staff of the military drawing department of the Tower of London (1741). In 1747 he was draughtsman for the government survey of the Highlands of Scotland, which gave him a good opportunity for sketching scenery. In 1752 he made 70 drawings of Windsor Castle and Eton, and afterward he accompanied Sir Joseph Banks on a tour of Wales. In 1768 he was appointed drawing master at Woolwich Academy, and became one of the most fashionable art teachers of his day. His *Views of the Encampment in the Parks* (1780) illustrate his style. He outlined his subjects with a pen and then washed them in with colors in a very simple and direct way. His best works are those in body colors, which are tinted with richness, depth and refinement and are not conventionalized by the bold pen outline. As a caricaturist, he is known by his ridicule of Hogarth's *Line of Beauty,* and his caricature portraits, such as those of *Lords North and Thurlow.* He was a member of the Incorporated Society of Artists, and one of the original members of the Royal Academy, founded in 1768.

SANDEMAN, săn'dê-măn, **Robert,** Scottish religious leader: b. Perth, Scotland, 1718; d. Danbury, Conn., April 2, 1771. He studied at Edinburgh and afterward engaged in the linen trade. On marrying the daughter of the Rev. John Glass (founder of the Glassites), he adopted his pastor's views in opposition to all church establishments and became an elder in his congregation. Soon afterward he published a series of letters, in which he endeavors to show that a justifying faith means nothing more than a simple assent to the divine mission of Christ. Sandeman went to London in 1760 and managed to gather together a congregation of his own followers, who were called Sandemanians. In 1764 Sandeman accepted an invitation to New England, and became the author of some theological tracts, letters, and discourses, besides his *Letters on Theron and Aspasio.* The Sandemanians revived the love feast (to take place in each other's houses); the kiss of peace; the support of the poor members by the community; washing each other's feet; community of goods; they maintained the unlawfulness of saving money, etc. They still have a slender following at Danbury, Conn. The most noted personage professing the Sandemanian faith

was the great scientist, Michael Faraday (q.v.), who lived and died in that communion.

SANDEMANIANS. See SANDEMAN, ROBERT; RELIGIOUS SECTS.

SANDERLING, a sandpiper (*Calidris arenaria*), peculiar in lacking the hind toe. This bird averages seven to eight inches in length, and is colored in winter, gray on the upper and white on the under parts; the spring plumage differs in exhibiting reddish tints, marked with black. It is nearly cosmopolitan, breeding in the Arctic regions of both hemispheres, and migrating to the southern parts of South America and Africa, though many winter in the Southern States. The food consists of worms, crustacea, etc. These birds chiefly inhabit the sandy tracts of the sea-beach, and the estuaries of rivers, but are common about large bodies of water in the interior also, and associate with other species. The flesh is nutritious and pleasant to the taste, and the bird is a favorite with gunners in quest of shore-birds.

SANDERS, Frank Knight, American scholar: b. Batticotta, Jaffna, Ceylon, 5 June 1861; d. 20 Feb. 1933. He was graduated from Ripon College, Wisconsin, in 1882, was instructor at Jaffna College, 1882–86, and studied semitic languages at Yale 1886–87. He was Woolsey professor of Biblical literature at Yale 1893–1901; held the chair of Biblical history and archæology and became dean of Yale Divinity School, 1901–05; was secretary of the Congregational Sunday School and Publication Society 1905–08; president of Washburn College, Kansas, 1908–14; and, 1914–27, director of the Board of Missionary Preparation. He published with C. F. Kent 'The Messages of the Bible' (12 vols., 1897–1912) and is author of 'The Teachers' Life of Christ' (1907); 'Studies in the Life of Paul' (1908); 'History of the Hebrews' (1914); 'The World's Living Religions' (with H. A. Sherman, 1923).

SANDERS, Henry Arthur, American classical scholar: b. Livermore, Me., 1868. He was educated at the universities of Michigan, Berlin and Munich. He was connected with the faculty of the University of Michigan in 1893–95, and continuously after 1899, becoming professor of Latin in 1911. In 1915–16, and in 1928–31, he was on leave of absence as acting director of the School of Classical Studies of the American Academy at Rome, Italy. He is a contributor to various philological, archæological and educational journals; edited 'Roman History and Mythology' (1910); and is author of 'Roman Historical Scenes and Institutions' (1904); 'The New Testament Manuscript in the Freer Collection' (1912); 'The Old Testament Manuscript in the Freer Collection' (1917); 'Washington Manuscript of the Psalms' (1917), etc.

SANDERS, Liman von, German general and field-marshal: b. 1855. "Liman Pasha" was sent to Turkey in 1913 as head of a military mission to reorganize the Turkish army, succeeding Marshal von der Goltz. In May 1914 he issued from Constantinople sealed orders for mobilization to be delivered to every mayor and village president, and to be opened only on telegraphic notice from the war office. These orders were unsealed on 3 August. Early in 1915 he is said to have been the chief instrument in hindering the actions of the Turkish peace party's plans. He personally conducted the defense of the Dardanelles against the powerful attacks of the British navy and army, establishing his headquarters at Gallipoli, the centre of the fighting. He informed American war correspondents in October 1914 of the practical impossibility of the capture of the Gallipoli peninsula with its impregnable fortifications, which had been the work of the British covering a number of years. He was succeeded in August 1915 by the Grand Duke of Mecklenburg and was made commander-in-chief of the Turkish forces on the Caucasian front. At the British investment of Jerusalem he forsook the Turkish army and returned to Constantinople in September 1917. When the Entente and associated powers concluded an armistice with Turkey in 1918 Liman von Sanders was arrested in Constantinople and remained under detention there until August 1919 when he was repatriated.

SANDERS' RAID INTO EAST TENNESSEE. On 14 June 1863 Col. W. P. Sanders, with 1,500 mounted men and two guns, left Mount Vernon, Ky., to destroy the East Tennessee and Virginia Railroad. Crossing the Cumberland River he surprised a body of 400 Confederates at Montgomery, Tenn., on the 17th, capturing 105 officers and men and a large amount of supplies. Avoiding the Confederates at points on the way, he struck the railroad at Lenoirs on the morning of the 19th, captured three guns and about 65 prisoners, burned the depot and other buildings, containing five guns, 2,500 stand of small arms and ammunition, and then destroyed the railroad to within a short distance of Knoxville. Leaving a regiment south of the city to demonstrate on it, Sanders, with the rest of the command, passed around the place during the night, struck the railroad north of it, burned the bridges and on the morning of the 20th made a strong demonstration on Knoxville by the Tazewell road. Artillery firing and skirmishing continued an hour, during which Sanders captured two guns, 30 prisoners and some horses, and then followed the railroad to Strawberry Plains, destroying all bridges, including one over the Holston 1,600 feet long, near which, after a sharp engagement with the bridge-guard, he took 140 prisoners, five guns and a train of cars loaded with supplies. At daylight 21 June he started up the railroad for the Mossy Creek bridge, destroying the road at several points, and also the bridge. Large quantities of stores and 120 prisoners were captured. He now left the railroad to return by Rogers' Gap, avoiding forces sent to intercept him. The gap was found blocked by fallen timber and guarded by infantry and artillery, and adjoining gaps were found similarly obstructed. With the enemy in his front and closing on his rear, he found but one way to escape, and that by a trail impassable for artillery. He abandoned his guns, after destroying them and their ammunition, and by a wood road moved through Smith's Gap, three miles from Rogers', driving a cavalry regiment from it, and after a hard march in the Cumberland Mountains, in which some of his men took wrong roads, he reached Boston, Ky., on the 23d with a loss during his raid of two killed, four wounded and 13 missing. He had captured 10

guns and 10,000 small arms and paroled 461 prisoners.

SANDERSON, John, American author: b. near Carlisle, Pa., 1783; d. Philadelphia, April 5, 1844. He was professor of Latin and Greek in the Philadelphia High School from 1836 until his death. With his brother he was author of *Biography of the Signers of the Declaration of Independence* vols. 1; 2, (1820), and was sole author of *Sketches of Paris* (1838); (London ed. *The Americans in Paris,* 1838).

SANDERSON, Julia, American actress and operatic singer: b. Springfield, Mass., Aug. 20, 1884. After attending the schools of her native city she made her debut with the Forepaugh Stock Company of Philadelphia, with which she remained for five years. In 1902 she appeared in *Winsome Winnie* at the Casino Theatre in New York, and later in *A Chinese Honeymoon.* She sang in *Wang,* with De Wolfe Hopper in 1904, and for several years appeared in vaudeville. She took the leading part in many light operas. For some years she was the star of the Sybil Company, appearing in various light operas and musical comedies in the principal cities with Donald Brian and Joseph Cawthorn. Other appearances were in *Rambler Rose* (1916–1918); *The Canary* (1918–1920); *Hitchy Koo* (1920–1921); *Tangerine* (1921–1923); *No, No, Nanette* (1925–1926); *Queen High* (1926–1927); and *Oh Kay* (1927–1928).

SANDERSVILLE, city, Georgia, Washington County seat; altitude 445 feet; on the Sandersville Railroad, 60 miles northeast of Macon. It is situated between the Oconee and Ogeechee rivers, in a fertile cotton region, and has a considerable export trade in cotton. It has cotton, lumber and paper mills. It was founded in 1796 and incorporated in 1812. Pop. (1950) 4,475.

SANDFORD AND MERTON, The History of, a famous book intended for juvenile reading by Thomas Day, published 1783–1789. Portraying English social ideas of its time, it is now regarded as a literary curiosity. It is named for two school boys whose adventures are related in sedate fashion. Morals are drawn from every incident of their daily lives and from the stories which they read in their lesson books. Not the least remarkable feature of the book is the polished language used by these children of six years of age, which was typical of the refinement advanced English culture of the period sought to instil in youth.

SANDINO, sän-dē'nō, **Augusto César:** Nicaraguan guerrilla leader: b. 1893; d. Managua, Feb. 21, 1934. He was the son of a coffee planter and was educated in the state schools, but little is known of his early life. In 1926 he joined the Liberal revolution with a force of some 800 men during the fighting with the Conservatives. In May 1927 the United States decided to intervene and to impose peace and disarmament on both sides, but the agreement negotiated at Tipitapa on May 3, 1927 was not recognized by Sandino, who refused to lay down his arms and retired to the mountains of northern Nicaragua, and there successfully defied all efforts by the United States Marines to capture him. When, on Jan. 3, 1933, the last marines were withdrawn from Nicaragua, Sandino and some 500 followers were still in defiant liberty, and had aroused the support of much of Latin America. On Feb. 2, 1933 Sandino made a peace agreement with President Juan Sacasa and with 100 followers embarked on a cooperative farming project on the Coco River. Subsequently, however, conflicts arose between his followers and the National Guard, and in February 1934 he went to Managua to discuss with President Sacasa means of terminating this friction. Sandino's assassination followed a dinner with the president; he and his brother Socrates, and two aides were seized by National Guardsmen, taken to the airport and shot. At first the blame was laid to "maladministration in the National Guard," but within a week a movement was under way to justify Sandino's execution. An offer of amnesty by the government in the interests of peace was accepted by most of Sandino's followers. Whether Sandino is regarded as a "bandit," the official United States view, or as a patriot, it is certain that his stand against intervention aroused anti-United States feeling in Latin America, which was only allayed with the institution of the Good Neighbor Policy by President Franklin Roosevelt.

SANDPAPER, an abrasive agent made by coating paper or thin cotton cloth with glue and dusting fine sand over it with a sieve. Sandpaper is intermediate between glass paper and emery paper in its action on metals, but is less energetic than glass paper in its action on wood.

SANDPIPERS, a collective term for the approximately 75 species comprising the family Scolopacidae. The group is related to other families of shorebirds, such as the plovers and the oyster-catchers, and, less closely, to the gulls, terns, and auks. The term "sandpiper" refers to the habits of these birds of running along sandy beaches uttering thin, piping notes. The vast majority of the members of the family Scolopacidae nest in the Northern Hemisphere. They are especially abundant in the far north where the numerous pools and abundant insect life of the arctic tundra during the brief northern summer provide them with ideal nesting conditions. The nest is usually a mere depression in the sand or grass. Four rather large and pointed eggs are laid. When arranged with the pointed ends together at the center of the nest they form a circle which the parent bird is just barely able to cover. Young sandpipers are long-legged, attractive little creatures, covered with buffy and yellowish down. They follow their parents as soon as they leave the shell and pick up their own food.

Sandpipers live mostly on small insects and other aquatic creatures. Their long legs and bills enable them to wade through shallow water and mud in search of their food. As a rule, they do not swim, though a few have the toes partially webbed or "semi-palmated," as it is called. The plumage of sandpipers is attractive but not brilliant. In general, the feathers are mottled with gray and brown to match the background of sand and marsh. During the nesting season a brighter plumage is usually acquired; the breast is then often reddish or chestnut. Unlike most birds the female sandpiper is in many species somewhat more brightly colored and larger than her mate. When this is the case, the female is often the more aggressive partner during court-

ship, while the male is left to perform most of the duties of incubation.

There are others, however, such as the pectoral sandpiper (*Erolia melanotos*) and the ruff (q.v.) in which the male is the larger and more colorful sex. Since the Arctic regions are entirely unsuitable for sandpipers during the long winter months, the northern nesters are birds of powerful flight. Many of them nest right around the Arctic region with little variation from continent to continent and in the autumn fly thousands of miles to the south to winter in southern Africa, Argentina, and even in the Hawaiian Islands, New Zealand, and Australia. Others are more hardy and winter on the seacoasts north to the latitude of Long Island or New Jersey. Most sandpipers are highly gregarious and move about in large flocks. These flocks may contain but a single species or several species of about the same size. In flight the members of a flock wheel and turn in perfect unison, as though guided by a single instinct. Sandpipers are good table birds, but their sociable habits and fearlessness permitted gunners to shoot unreasonable numbers. A number of species became very rare, and laws were passed protecting sandpipers throughout the year in Canada and the United States. In addition to the more typical sandpipers, the family Scolopacidae also contains some specialized or unusual types, such as the woodcocks, snipe, and curlews. These are sandpipers in the inclusive sense,

The commonest and best known sandpiper in North America is the spotted sandpiper (*Actitis macularia*). This bird is by no means restricted to the coast, but is found along almost every creek or pond on the continent. It is known to the farm boy as the "tip-up" because of its habit of teetering nervously up and down on its slender legs. This habit, shared by many species of birds which live along bodies of water, is thought to aid such species in judging distance. The spotted sandpiper is smaller than a robin, grayish above and white below, with black spots on the breast. These spots are lost during the winter and are absent at all seasons in the closely related common sandpiper (*A. hypoleucos*) of the Old World. Turning now to those species that nest in the far north and migrate or winter along our ocean beaches, one finds a number of species of small size, such as the least sandpiper (*Erolia minutilla*), the red-backed sandpiper (*E. alpina*), and the semipalmated sandpiper (*Ereunetes pusillus*). Some of these are no larger than sparrows and are most amusing and attractive as they run rapidly up and down the beaches following each receding wave in search of food. They are often known collectively as "peeps" and the bay gunner of a past generation would shoot large numbers of them to make "peep pie." Two related species, the purple sandpiper (*Erolia maritima*) of the North Atlantic and the rock sandpiper (*E. ptilocnemis*) of the North Pacific, are remarkable in that they are hardy enough to pass the winter along northern seacoasts and are only slightly migratory. Another large and well-known group of sandpipers is that comprising the genus *Tringa*. It includes among American species the solitary sandpiper, and the two species of yellowlegs, and in the Old World the redshanks, the greenshanks, and the green and wood sandpipers. These are birds of larger size. The greater yellowlegs (*T. melanoleucus*), for example, stands about a foot high. When feeding it dashes about very actively in shallow water in pursuit of minnows and aquatic insects. The species of this genus are often called "tattlers" because of their loud, piercing cries, which seem to warn geese and other waterfowl of the presence of a hunter. The solitary sandpiper (*T. solitaria*) migrates along inland streams and ponds. As it alights it has the habit, shared by some other shorebirds, of gracefully elevating its wings above the back and then quickly folding them. Unlike its relatives, the solitary sandpiper does not nest on the ground but prefers to lay its eggs in an old nest of a robin or some such tree-nesting bird. One of the finest species of American sandpipers is the Bartramian sandpiper (*Bartramia longicauda*) or "upland plover" as it is called, though it is not a true plover. It is a bird of grassy plains and fields, seldom seen along beaches. About 12 inches in length, it is handsomely marked with brown and gray. All the notes of this bird are musical. The call note is a bubbling warble, often heard as this bird migrates over at night. On the nesting grounds the upland plover mounts high in the air and, sailing on motionless wings, utters a long-drawn, haunting whistle. Such aerial songs or display flights are characteristic of a number of shorebirds. In winter the upland plover migrates all the way to the pampas of the Argentine. This species is a very close relative of the curlews. Some of the latter are as large as a chicken and are the largest members of the family Scolopacidae.

L., *Check-list of Birds of the World*, vol. 2 (Cambridge, Mass., 1934); Pough, R. H., *Audubon Water Bird Guide* (New York 1951).

Dean Amadon,
Assistant Curator, Department of Birds, American Museum of Natural History.

SANDPOINT, city, Idaho, Bonner County seat; altitude 2,086 feet; on Pend Oreille Lake, an expansion of Clark Fork River; near the Kaniksu, and the Coeur d'Alene national forests in the Rocky Mountains; 68 miles northeast of Spokane, Wash.; on the Northern Pacific; Great Northern; and the Spokane International railroads; state and federal highways; and with a municipal airport. It is in a rich agricultural and timber region; has lead and silver mines; fishing interests; and lumber and shingle mills. Sandpoint is likewise a popular lake resort, famous for its superb scenery. Its name is derived from a white sand bar that extends into Pend Oreille Lake. The latter ranks among the largest fresh-water lakes wholly within the United States, having a shore line 111.3m. long, while its maximum depth is 1,200 feet. There is a public library; and near by, at Hope, is the David Thompson Monument, erected on the site of the first dwelling built in Idaho, in 1809. Hope was also visited by the Lewis and Clark Expedition in 1805. Pop. (1950) 4,265.

SANDRART, zän'drärt, **Joachim von,** German artist and art critic: b. Frankfort-on-Main, May 2, 1606; d. Nürnberg, Oct. 14, 1688. He studied painting and copperplate engraving under eminent painters and engravers at Utrecht. Subsequently he traveled throughout England, gaining court recognition and receiving art commissions from Charles I and from the duke of

Buckingham, and Italy (1627) where he became, at Rome, the intimate friend of Claude Lorraine. Among other pictures, he painted 'The Death of Seneca' for the king of Spain and a 'Nightpiece' in the style of Honthorst; besides furnishing the illustrations for 'Galeria Giustiniana' (1631). He executed under commission from Urban VIII several portraits and pictures for the churches in Rome and made a number of sketches in central Italy for M. Zeiter's 'Itinerarium Italiæ' and Gottfried's 'Archontologia Cosmica.' On his return to Frankfort he painted for Maximilian I of Bavaria in the gallery at Schleissheim 'The Twelve Months' and 'Day and Night.' He subsequently inherited the estate of Stockau, near Ingolstadt, assumed a title and henceforth gave a good deal of his time to art literature, painting also some portraits of the nobility. His masterpiece is 'The Company of Archers assembled to do Honor to Maria de Medici when she visited Amsterdam,' now in the town-hall of that city. But his works on art are so important that they have almost obscured his fame as a painter. These books include 'Deutsche Akademie der edlen Bau-Bild- und Malereikünste' (1675–79; critical edition by Sponsel 1896); 'Admiranda Sculpturæ seu Statuariæ Veteris' (1689), and 'Insignium Romæ Templorum Prospectus Exteriores et Interiores.'

SANDRINGHAM, sănd'rĭng-ạm, England, in Norfolk, seven and one-half miles northeast of Lynn, is an estate comprising 7,000 acres. It was purchased in 1862 by the Prince of Wales, later Edward VII, who erected a mansion in Elizabethan style as a country residence. It is surrounded by a charming park of 200 acres. The "Norwich gates," the dairy and the cottages are interesting features. The Germans made an aerial attack on Sandringham in January 1915.

SANDROCOTTUS, săn-drō-kŏt'ŭs, the Indian king to whom Megasthenes was sent by Seleucus Nicator, in 306, as his Ambassador. Megasthenes improved the opportunity to collect materials for his historic work in four books, 'Indica,' which is the most important work of Greek antiquity upon that subject. According to this author Sandrocottus reigned over the Gangaridæ and Prasii, nations of the Ganges Valley. After the death of Alexander he extended his dominion over the whole of northern India, subduing even the Macedonians whom Alexander had put in possession of the Indus Valley and the Punjab. Seleucus received 500 war elephants from the Indian conqueror on confirming the cession of this territory and left Megasthenes as his Ambassador at the courts of Sandrocottus. This monarch, originally a robber chieftain, may now safely be identified with Chandragupta, whose accession is celebrated in the Sanskrit drama 'Mudrarakshasa.' His capital was Pataliputra (Gk. Palibothra), modern Patna, a city situated in Bengal on the banks of the Ganges, and there he established the Mauryan dynasty. Consult Schwanbeck, 'Megasthenis Indica' (1846); Mulier, 'Fragmenta Historicum Græcorum' (1841–70); McCrindle, 'Ancient India as Described by Megasthenes and Arrian' (1877).

SANDS, Benjamin Franklin, American naval officer: b. Baltimore, Md., 11 Feb. 1811; d. Washington, D. C., 30 June 1883. He entered the navy as midshipman in 1828, was commissioned lieutenant in 1840 and served in the Mexican War. In 1851–59 he was engaged in the coast-survey service, receiving promotion to commander in 1855. In 1862 he was commissioned captain. In 1862–65 he was senior officer in command of the blockade off Wilmington, N. C., participated in both attacks on Fort Fisher, was in command of the blockade off the coast of Texas from February to June in 1865, and raised the flag at Galveston, the last post held by the Confederates. He was commissioned commodore in 1866, was superintendent of the naval observatory at Washington in 1867–73, commissioned rear-admiral in 1871 and placed on the retired list in 1874.

SANDS, Henry Berton, American surgeon: b. New York, 27 Sept. 1830; d. there, 18 Nov. 1888. He was graduated from the College of Physicians and Surgeons in 1856 and later studied abroad. On his return from Europe he became demonstrator of anatomy at the College of Physicians and Surgeons; in 1869 was appointed professor of anatomy and in 1879 professor of the practice of surgery, holding the latter position till his death. He was attendant or consulting surgeon for several different hospitals, but gradually gave up his hospital work to give his attention to a rapidly increasing private practice. He became one of the foremost surgeons of the city and was called for consultation in President Garfield's case. His publications include 'Aneurism of the Sub Clavian, treated by Galvano Puncture' (1869); 'Esmarck's Bloodless Method' (1875); 'Treatment of Intussusception by Abdominal Method' (1877); 'Question of Trephinery in Injuries of the Head' (1883), and 'Rupture of the Ligamentum Patellæ and its Treatment by Operation' (1885).

SANDS, Robert Charles, American poet and author: b. Flatbush, L. I., 11 May 1799; d. Hoboken, N. J., 17 Dec. 1832. He was graduated from Columbia in 1815, admitted to the bar in 1820, but devoted himself almost exclusively to literature. He established and edited in 1824 the *Atlantic Magazine*, which later became the New York *Review*, and in 1825–27 was associated with William Cullen Bryant in editing it. From 1827 until his death he was on the editorial staff of the *Commercial Advertiser*. He wrote with Bryant and Verplanck a series of essays published in the form of an annual, 'The Talisman' (1828–30), in which appears one of his longest poems, 'The Dream of the Princess Papantzin.' He also wrote 'Historical Notice of Herman Cortes' (in Spanish, 1828); 'Life and Correspondence of Paul Jones' (1831); 'The Dead of 1832' (poem, 1832), etc.

SANDS, William Franklin, American diplomatist: b. Washington, D. C., 29 July 1874. He was educated at Saint Michel, Fribourg, Switzerland, Stella Matutina College, Feldkirch, Austria, and Georgetown University, Washington, D. C. He was appointed second secretary of the American legation at Tokio, Japan, in 1896; became first secretary at Seoul, Korea, two years later and was chargé-d'affaires ad interim in 1899. From 1900 to 1904 he was adviser to the emperor of Korea, in 1905–07 was secretary and chargé at Panama, in 1907–

1908 in Guatemala and in 1908–1909 in Mexico. In 1909–1910, Mr. Sands was American Envoy Extraordinary and Minister Plenipotentiary to Guatemala. In the latter year he resigned to enter business. He served on the Prisoners' Relief Commission in Russia, 1916–1917. For his services to French citizens during the Boxer Rebellion he was made a Chevalier of the Legion of Honor.

SANDSTONE, consolidated sand. The grains of a sand, chiefly silica, may be compacted by pressure alone, forming easily workable free stone, but generally they are held together by some cement, as (1) iron oxide, which coats the grains and cements their adjoining portions, forming a brownstone; (2) silica, which fills in the interstices between the grains and generally causes secondary enlargement of each grain in such a manner that the new quartz forms a continuous crystal with the old quartz grain, the rock thus becoming a solid mass of crystalline quartz; (3) lime; or (4) clay, forming calcareous and argillaceous sandstones respectively. Impure quartz sandstones may be argillaceous, calcareous, feldspathic, glauconitic or micaceous, according to the admixture. When derived from unassorted disintegration products of crystalline (feldspathic) rocks, they are called arkosic. Sandstone composed wholly or in large part of comminuted coral or shell sand cemented by infiltrated calcium carbonate makes up extensive beds of plastic limestones to which the name sandstone is commonly applied by the quarrymen. Such lime-sandstones may analyze as high as 99.6 per cent calcium carbonate. Ordinarily the term sandstone is applied to quartz sandstones whether pure or impure.

Sandstone very commonly shows lines of stratification or bedding, where exposed in section, and a cross-bedding structure is very common, the various minor layers of a bed being inclined in different and often opposite directions. All sandstones of shallow water deposit may show ripple marks, rill marks, wave marks, and impressions and traces of various animals, while aeolian sandstones may show fine bedding and wind rippling together with great diversity in thickness. Among littoral deposits coarse sandstones are found between tide marks, fine in shallow water (less than 100 fathoms).

In the United States quartz sandstones are widely distributed geographically and geologically. Among the more important commercial deposits are the following: The Cambrian sandstone of New York (Potsdam sandstone), Wisconsin, Minnesota, Michigan (Saint Croix sandstones), and the Rocky Mountain region, as well as early Cambrian sandstones of the southern Appalachians; the Ordovician (Saint Peter's) sandstone of the upper Mississippi; Medina (Silurian) sandstones of New York and Pennsylvania; the Oriskany, Hamilton, and Portage (Devonian) sandstones of New York, mostly used for flagging purposes; the Waverly (Lower Carboniferous) sandstones of Ohio, which furnish the bulk of the whetstones and grindstones of the country; the Pottsville and lower coal measures of Pennsylvania and West Virginia; the red sandstones of the Connecticut Valley; New Jersey and Nova Scotia (Jura-Trias); and the Dakota sandstone of the West. Old Red Sandstone is the term applied to the continental (nonmarine) type of deposit formed during the Devonian era in Great Britain and Ireland. This consists of a mass of red sandstone shales and conglomerates from 10,000 to 16,000 feet in thickness and contains igneous rocks aggregating 6,000 feet thick near the middle. From it many remarkable fossil remains have been obtained. New Red Sandstone was a term used for red sandstone of the Triassic age in Great Britain.

Consult Ries, H., *Building Stones and Clay Products* (New York 1912); United States Geological Survey, *Mineral Resources of the United States* (Washington 1948).

SANDUSKY, săn-dŭs'kĭ, city, Ohio, Erie County seat, altitude 598 feet, is located on Sandusky Bay, Lake Erie, 60 miles west of Cleveland, on the New York Central; Pennsylvania; Baltimore and Ohio; and New York, Chicago and St. Louis railroads. It is a port of entry, an important shipping point for coal and sand, has two privately owned airports, and extensive lake fishery operations. It also has a thriving vacation and tourist business. The adjacent area is productive farmland, with vineyards and orchards providing quantities of grapes, peaches, pears, plums, and apples. The city is noted for its wineries. There are also large deposits of sand, gravel, clay, and limestone nearby.

Besides fishing, coal shipping, and wine-making, Sandusky manufactures more than a hundred nationally distributed products, including clay and cement products, paper, corrugated boxes, crayons, chalk, water colors, boats, castings, chain, food products, fertilizer, glues and pastes, radios, rubber goods, washing machines, farm and industrial machinery. A branch of Bowling Green State University is here, and the Ohio Soldiers' and Sailors' Home. A two-mile bridge across the bay connects the city with Marblehead Peninsula, and there is regular steamship service to the extensive recreation area of Cedar Point. The state has fish hatcheries at Put-in-Bay.

This lakeside area was explored early by the French. By 1749 English traders were frequenting the region, and in 1763 a fort was built—and was burned the same year by the Indians in the Pontiac Conspiracy. In 1813 Commodore Oliver Hazard Perry defeated the British in a naval action at Put-in-Bay, thus winning the Battle of Lake Erie in the War of 1812. In 1816 settlers from New England called the place Portland; in 1818 the enlarged plat was named Sandusky City; the second part of the name was dropped when urban incorporation came in 1845. It was made the seat of Erie County in 1838. Sandusky is a corruption of the Indian word meaning "at the cold water"—referring in this case to the cool springs nearby. In 1849 it experienced a serious plague of cholera. Through the '80s and '90s the city prospered. In 1916 Sandusky adopted commission government. Pop. (1940) 24,874; (1950) 29,375.

SANDUSKY, a bay indenting the northern part of Ohio, an inlet of Lake Erie. It is 20 miles long and five miles wide and forms an excellent harbor.

SANDWICH, sănd'wĭch, 4TH EARL OF, (JOHN MONTAGU), English politician: b. Nov. 3, 1718; d. London, April 30, 1792. He was educated at Cambridge, traveled extensively in the Mediterranean countries and in 1739 returned to England where he took his seat in the House of

Lords and became a political follower of the Duke of Bedford. He became Lord Commissioner of the Admiralty in 1744 and was shortly afterward appointed captain in the Duke of Bedford's regiment. His promotion in the army was rapid and at his death he was senior general on the list. He was appointed Ambassador to Madrid in 1763, but before he could depart on his mission he was made one of the principal secretaries of state. While in this office he took part in the famous prosecution of John Wilkes. In 1768 he became Postmaster-General and in 1771 was nominated first lord of the admiralty, an office he held for 11 years. His own gain and party interest were made of paramount importance and to the insufficient equipment of the navy was justly laid much of the disaster which the British navy encountered in those years. His administration was on the whole disastrous; his immoral private life was revealed by the murder of his mistress, and perhaps no man of the 18th century was held in more bitter contempt in England. He lived a practically retired life after 1782 and is the reputed inventor of the sandwich as a timesaver for his gambling propensities.

SANDWICH, town and cinque port, England, Kent County, is located on the Stour River, 12 miles east of Canterbury. It has a tannery and a cereal factory. The tower of St. Clement's Church is an example of early Norman architecture, and there are extensive Roman remains. Pop. (1951) 4,142.

SANDWICH, city, Illinois, De Kalb County, altitude 657 feet, is located 56 miles southwest of Chicago, on the Chicago, Burlington and Quincy Railroad. It has manufactures of farm implements, corn elevators, vacuum pumps, work clothing, dairy products, airplane radio crystals, and burial vaults. Pop. (1950) 3,027.

SANDWICH, town, Massachusetts, Barnstable County, altitude 15 feet, is located on Cape Cod Bay, 62 miles southeast of Boston, on the New York, New Haven and Hartford Railroad. This typical old Cape Cod community was first settled in 1637, and was incorporated in 1639. Its chief industry is the cultivation of cranberries. It holds a unique place in the American manufacture of fine colored glass. For more than half a century, beginning about 1825, Sandwich artisans made glass by methods of which the secret has been lost. The town has a museum with relics of early Cape Cod life and customs, and a fine collection of old locally made glassware. Pop. (1950) 1,007.

SANDWICH, town, New Hampshire, Carroll County; altitude 800 feet, is located 45 miles northwest of Dover, with bus connections with the Boston and Maine Railroad at West Ossipee. Sandwich is a tourist resort in a region of farm and forest. Here in 1926 was founded the first home industry unit of handicraft articles for which New Hampshire is noted. Two of John Greenleaf Whittier's poems concern Sandwich—his *Sunset on the Bearcamp* and *Voyage of the Jettie.* Pop. (1950) 615.

SANDWICH, town, Ontario, Canada, in Essex County; since 1935 a residential section of the city of Windsor, on the Detroit River, opposite the city of Detroit, Mich. It was first settled by the French as L'Assomption.

SANDWICH BAY, Canada, inlet on Labrador's southeast coast, 30 miles long and 10 miles wide at the entrance. Here are several lumber hamlets, including Cartwright (pop. 183).

SANDWICH ISLANDS. Old name for the Hawaiian Islands.

SANDY HILL, N. Y. See Hudson Falls.

SANDY HOOK, N. J., a low, sandy peninsula in Monmouth County, about 18 miles south of New York. It begins at the Navesink Highlands and extends north six miles; its width is less than a mile. On the west side of the peninsula is Sandy Hook Bay. At the northern extremity is a beacon light, and about a mile south of this point is a lighthouse 90 feet in height. At the outermost point is Fort Hancock. On the peninsula is a government proving ground for ordnance and armor plate.

SANDYS, sändz, Sir **Edwin,** English statesman and colonist, second son of Edwin Sandys, archbishop of York: b. Worcestershire, Dec. 9, 1561; d. October 1629. He was graduated at Corpus Christi College, Oxford, in 1579. He first entered parliament in 1586 as a member for Andover. He became a supporter of James I, upon whose coronation in 1603 he was knighted. He was a member of the king's first Parliament, and in 1619–1620 he was treasurer of the Virginia Company, which he ably promoted, and continued his interest in the colony's affairs until his death. He was in his later years suspected of sympathy with the Parliamentary cause, but retained the favor of the king.

Consult Brown, A., *The First Republic in America* (Boston 1898); Fiske, J., *Old Virginia and Her Neighbours* (Boston 1900).

SANDYS, George, English poet, traveler and Virginia colonist, brother of Sir Edwin Sandys (q.v.): b. Bishopsthorpe, Yorkshire, March 2, 1578; d. Boxley, near Maidstone, Kent, March 4, 1643 or 1644. He studied at Oxford and later traveled in France, Italy, Turkey, Egypt, and Palestine, writing an account of his journeys which was of considerable ethnological and geographical value. He was appointed treasurer of the Virginia Company in 1621, succeeding his brother, Sir Edwin, and sailed for Virginia soon afterward. He built the first water mill there and established shipbuilding and iron works. He was treasurer until 1625 and was appointed a member of the council in 1624, and again in 1626 and 1628. In 1631, after some controversy concerning his alleged infringements of the rights of other settlers, he returned to England. While in Virginia he completed his translation of the first 10 books of Ovid's *Metamorphoses* (1626), the first work of the sort accomplished in America, and upon which his reputation as a poet largely rested. He was also author of *A Paraphrase upon the Psalms of David and upon the Hymnes Dispersed throughout the Old and New Testaments* (1636); and of *A Paraphrase upon the Song of Solomon* (1641). He also translated Hugo Grotius's *Christ Passion* from the Latin (1640).

SANFORD, săn'fẽrd, **Edmund Clark,** American psychologist and college president: b. Oakland, Calif., Nov. 10, 1859; d. Worcester, Mass.,

Nov. 22, 1924. He was educated at the University of California (1883) and at Johns Hopkins University, where he held a fellowship 1887–1888. He taught at Oahu College in Honolulu, Hawaii, 1883–1885, and in 1889 joined the faculty of Clark University, Worcester, where he was professor of expermiental and comparative psychology 1900–1909. From 1909–1920 he was president of Clark College, but resigned in 1920 to rejoin the faculty of Clark University as professor of psychology and education, a position he held until his death. From 1895 he was joint editor of *The American Journal of Psychology*, and in 1902 was president of the American Psychological Association. He was author of *A Course in Experimental Psychology* (1898).

SANFORD, Edward Terry, American jurist: b. Knoxville, Tenn., July 23, 1865; d. Washington, D.C., March 8, 1930. He was educated at the University of Tennessee (1883), Harvard University (1885; 1889), and held honorary degrees from both Harvard and Cincinnati. He was admitted to the Tennessee bar in 1888, was Assistant Attorney General of the United States, 1907–1908, United States District Judge for the Eastern and Middle District of Tennessee, 1908–1923, and was appointed an Associate Justice of the United States Supreme Court in 1923. He held this office at the time of his death.

SANFORD, Henry Shelton, American diplomatist: b. Woodbury, Conn., June 15, 1823; d. Healing Springs, Va., May 21, 1891. He was educated at Washington (now Trinity) College, Hartford, and at Heidelberg University. In 1847 he entered the diplomatic service and became attached to the Saint Petersburg legation. The next year he was acting secretary to Andrew J. Donelson at Frankfort and during 1849–1854 secretary of legation at Paris. He was United States Minister to Belgium, 1861–1869, and rendered service of great importance during the Civil War. He negotiated the Scheldt Treaty of navigation and commerce. In 1877 Leopold II of Belgium appointed him to the executive committee of the Association for the Exploration and Civilization of Central Africa; and in 1885 he was one of the signers for the United States of the General Act of the Conference of Berlin which established the status of the Congo Free State. On July 2, 1890, at Brussels, he was a signer of the General Act by which the United States and other powers agreed to suppress the slave trade and restrict the commerce in arms and liquor in Africa. From 1870 he made his home on his plantation on the St. John's River in Florida.

SANFORD, city, Florida, Seminole County seat, is located on Lake Monroe and the St. John's River, 20 miles northeast of Orlando, on the Atlantic Coast Line Railroad. It is the leading celery market of Florida, packs and ships citrus fruit, and has manufactures of cement products. It is the outgrowth of Mellonville, a trading post established in 1837 near a frontier fort. In 1870 Henry Shelton Sanford (q.v.) bought 12,000 acres of land here, including the townsite, and the city was named in his honor. Pop. (1950) 11,935.

SANFORD, town, Maine, York County, altitude 310 feet, is located on the Mousam River, 35 miles southwest of Portland, on the Sanford and Eastern Railroad. The chief industries are the manufacture of upholstery and drapery fabrics, palm beach cloth, shoes, yarn, dress goods, and lumber. There is a high school, established in 1874; two public libraries which were founded by library associations in 1898 and became free public libraries in 1900; and a town hall.

The land was purchased from the Indians in 1661 and the project of laying out a town was formed as early as 1676, but no permanent settlement was made until 1730, the exact date being uncertain. The place was first called Phillipstown in honor of Major Phillips of Boston, original grantee. It was incorporated in 1768 and named for Major Phillips' stepson, Peleg Sanford, governor of Rhode Island. Industrial development started in 1867 when a factory began making carriage robes and blankets. The town of Sanford also includes the village of Springvale. The government is a representative town meeting membership administered by a board of selectmen. Pop. (1950) 15,177.

SANGALLO, säng-gäl'lō, **Antonio da,** Italian architect: b. Florence, 1455; d. there, 1534. He built in Montepulciano the church of the Madonna di San Biagio; the palaces Cervini and Bellarmini; in San Savino the palace of the Cardinal di Santa Prassede; in Arezzo the church of the Annunziata; and the citadel in Civita Castellana.

SANGALLO, Antonio da (Cordiani), Italian architect, nephew of the preceding: b. Mugello, near Florence, 1483?; d. 1546. He designed and built the church of Madonna di Loreto, at Rome; the Porta di San Spirito; the church of San Spirito; the palace Sacchetti; the palace Farnese. He also enlarged the Vatican and executed the famous fountain at Orvieto.

SANGALLO, Giuliano da (Giamberti), Italian architect (brother of Antonio the Elder): b. Florence, 1445; d. there, 1516. At Florence he built the monastery of Santa Maria Maddalena de Pazzi and the Palace Condi; in Prato, the church of Madonna delle Carceri; in Cajano, the Villa Poggio for the Medici. He constructed the fortress at Ostia; the façade of Santa Maria dell Anima in Rome; the monastery of San Pietro in Vincoli, and the flat roof of the church of Santa Maria Maggiore. He also built Pisa's citadel.

SANGAMON, săng'gà-mŭn, a river of Illinois, with headwaters in Champaign and McLean counties. It flows southeast to Sangamon County where it unites with the south fork of the river, and changes the direction of its course, flowing northwest, then west, then northwest and enters the Illinois River by two channels. Total length, 225 miles. The confluence of the main stream (north fork) and the south fork is six miles east of Springfield and the mouth of the river is about 44 miles west-northwest of Springfield.

SANGER, săng'ĕr, **Joseph Prentice,** American soldier: b. Detroit, Mich., May 4, 1840; d. March 15, 1926. He was educated at the University of Michigan and at Bowdoin. He served in the Civil War, being successively second lieutenant of the First Michigan Infantry, second lieutenant of the First United States Artillery and after October 1861 as a first lieutenant he was attached to a battery of light artillery.

He was wounded and was twice brevetted for gallantry; was orderly officer to President Lincoln for a short time in 1862, and after the war was adjutant of his regiment. He took part in the expedition against the Fenians in 1866. In 1872–1875 he was professor of military science, tactics and law at Bowdoin and in 1874 was admitted to the bar at Portland, Me. He was detailed to accompany General Upton on a tour of inspection of the armies of Japan, China, Persia, India, Turkey, Italy, Russia, Austria, France, and England in 1875–1877. In May 1898 he was made brigadier general and in 1899 was assigned to command the department and subsequently the district of Matanzas, Cuba. Subsequently he was made director of the census of Cuba and Puerto Rico; in 1901–1902 was inspector general and chief of the staff, director of the Philippines, director of the Philippine census in 1902; became major general in 1904 and was retired the same year. In 1910 he was a member of the Brownville court of inquiry.

SANGER, săng'gẽr, **Margaret,** American birth control propagandist: b. Corning, N. Y., Sept. 14, 1883. After studying in the schools of her native town, and at a nurses' training school, she undertook, in 1915, the publication and editorship of the *Woman Rebel,* later the *Birth Control Review,* organ of the American Birth Control League. Her aggressive advocacy of birth control brought her in frequent conflict with the law prohibiting the circulation of matter relating to it through the mails, and she was several times arrested, but never convicted. She traveled widely in the United States and abroad in the interest of birth control and wrote much on the subject. Her books include: *The Case for Birth Control* (1917); *Woman and the New Race* (1920); *The Pivot of Civilization* (1922); *Motherhood in Bondage* (1928); *My Fight for Birth Control* (1931); *Margaret Sanger: An Autobiography* (1938).

SANGIHE, säng'ê, or **SANGIR** or **SANGI ISLANDS,** Malay Archipelago, a group midway between northeastern Celebes and the southern point of Mindanao in the Philippine Islands. The largest islands of the group are Groot (Great) Sangihe, Siaoe and Tagoelandang. Groot Sangihe, the most northerly, contains the volcano of Awoe (4,000 feet), whose eruptions in 1812, 1856, and 1892 caused great destruction and loss of life. All the islands are mountainous, partly volcanic and well cultivated. Clouds of sulphur constantly issue from the craters of volcanoes on Siaoe and Roang, and earthquakes are frequent. Chief products are rice, pisang, sago and cocoanut oil. Edible birds' nests abound in the smaller islands. Exports of copra, rattan, and heavy woods continue, but export of nuts and nutmegs has shrunk to virtually nothing on account of tree diseases. The Malay natives became Moslems in the 15th century and were converted to Christianity by the Portuguese. Most of them are Protestants. The islands are a part of the Netherlands-Indonesian Union. Schools are managed by the Sangihe and Talaud Committee, a missionary society. Pop. (1930) 134,904.

SANGRAAL, săng-grāl'. See GRAIL, THE HOLY.

SANGRE DE CRISTO, sän'grā dā krēs'tō, a range of mountains in the south central part of Colorado. See ROCKY MOUNTAINS.

SANGSTER, Charles, Canadian poet: b. Kingston, province of Ontario, July 16, 1822; d. 1893. He was self-educated, and in 1849 became editor of the Amherstburg *Courier,* but shortly afterward returned to Kingston and engaged in journalism there. He was employed in the Post Office Department at Ottawa in 1868–1886. His verse received favorable notice both in America and England, and the highly patriotic character of it is credited with greatly advancing the cause of confederation in Canada. Author of *Saint Lawrence and the Saguenay* (1856); *Hesperus and Other Poems* (1860).

SANGSTER, Margaret Elizabeth Munson, American writer: b. Munson, N. Y., Feb. 22, 1838; d. Glen Ridge, N. J., June 4, 1912. In 1871 she became associate editor of *Hearth and Home;* 1873–1879, editor of *The Christian at Work* and in 1889–1899, editor of *Harper's Bazaar.* After 1899 she was staff contributor to the *Ladies' Home Journal.*

SANGSTER, Margaret Elizabeth (Mrs. Gerrit Van Deth), American writer: b. Brooklyn, N. Y., Sept. 27, 1894. She was educated in private schools, and in 1913 became associate editor of the *Christian Herald.* In 1918 she visited Belgium, Germany and France as correspondent for this magazine. She wrote much in prose and verse, including *Friends o' Mine* (1913); *Real People and Dreams* (1914); *Cross Roads* (1919); *The Island of Faith,* novel (1921); *Your Book and Mine* (1923); *Five Thousand a Year* (1924); *The Hill of Ambition* (1925); *The Youngest Thief* (1930); besides contributions to magazines.

SANGUINARIA, săng-gwĭ-nā'rĭ-ȧ, a monotypic genus, the bloodroot of the family Papaveraceae, indigenous to eastern North America and often cultivated for ornament. It prefers sheltered places in woods, where it can grow in leaf-mold. The thick, palmately lobed leaf is lapped around the bud, which swiftly outgrows its protector, loses its two fugacious sepals and opens into a star-shaped flower with several fleshy white petals and a mass of golden stamens in the centre. The flower closes again at night or on shady days, since it blooms in the earliest, cool days of spring. The leaves continue to grow during the summer and become nearly seven inches long. The seeds are contained in spindle-shaped capsules. The whole plant is very brittle and succulent and when broken, especially at its thick, fleshy rootstock, an acrid red juice flows copiously forth. This juice has caused the plant to be called bloodroot, and it was considered, by the doctrine of signatures to be a cure for blood diseases; later it becomes officinal as a cathartic, emetic and expectorant. The sanguinaria is also called red puccoon or Indian paint, because the aborigines used it as a stain for their skins and as a dyestuff.

SANHEDRIN, săn-hē'drĭn, a Jewish court of justice, especially the supreme judicial tribunal of the Jews, existing in and before New Testament times. According to rabbinical tradition the institution of the Sanhedrin is to be traced to the time of Moses and the events

mentioned in Numbers 11:16, 17, but this view is now generally rejected, and the time of its institution referred to a much later date. The most probable opinion is that it consisted of 71 members, including the president. From incidental notices in the New Testament we learn that the members were drawn from three different classes: "the chief priests," consisting partly of those who had previously filled the office of high-priest and partly of the heads of the 24 classes into which the priests were divided; "the elders of the people," that is, the heads of tribes and family associations; and "the scribes," or those learned in the law. The Sanhedrin sat originally within the temple precincts every day from the conclusion of the morning sacrifice until the evening sacrifice; excepting on Sabbaths and festivals. At its head was a president, who bore the honorable title of *nasi* or *prince*. The jurisdiction of the Sanhedrin, as the supreme tribunal of the Jews in civil as in ecclesiastical matters, was very extensive. It was the final court of appeal from all inferior courts; and, in addition to this, it alone had the right of judging in matters affecting a whole tribe, of determining questions of peace or war, of trying the high-priest or a disobedient member of its own body. It pronounced also upon the claims of prophets and upon charges of blasphemy. Its jurisdiction was not confined to Palestine, but extended to every place where the Jews had settlements (Acts 9:2). According to the Jerusalem Gemara, the power of inflicting capital punishment was taken away from this tribunal 40 years before the destruction of Jerusalem, and this accords with the answer of the Jews to Pilate (John 19:37), "It is not lawful for us to put any man to death." It might indeed pass sentence of death, but it required the confirmation of the Roman procurator before such sentence could be executed. The forms of procedure in the court seem to have been characterized by a general spirit of fairness. Different kinds of evidence were carefully weighed, and the agreement of at least two witnesses was necessary to procure a sentence of condemnation. A majority of the full membership was sufficient for a sentence. The place of meeting of the Sanhedrin was eventually changed to a portion of the court of the Gentiles, and, after several other changes, its seat was finally established at Tiberias. Besides the great Sanhedrin there were also inferior courts or lesser sanhedrins in the country towns, composed of persons of the same classes, and in contradistinction to these, the metropolitan council was termed the Great Sanhedrin. After the destruction of Jerusalem by the Romans these courts were abolished. Napoleon I convened a court under the name Sanhedrin, and it established 12 legal principles for the government of Jews in France. This was also called the Assembly of Notables and was dissolved in 1897. Consult Tama, *Transactions of the Parisian Sanhedrin* (London 1807).

SANHITA, săn'hĭ-tä, the Hindu designation of that part of the sacred writings of the Brahmins, which contain the mantra or hymns.

SANIDINE, or **GLASSY FELDSPAR,** an important rock-forming mineral. It is a variety of orthoclase, is found in tabular or square-prismatic crystals, often Carlsbad twins, frequently vitreous in appearance. It occurs only in the recent eruptive rocks such as obsidian, phonolyte, trachyte and rhyolite. Its best-known locality is the Drachenfels, Germany.

SANITARY ENGINEERING, the branch of engineering dealing with the promotion and conservation of the public health, comfort, and convenience by the control of the environment. Specifically, it deals with water supply, sewerage, stream pollution, sewage and industrial waste treatment, swimming pools, natural bathing areas, refuse collection and disposal, milk sanitation, sanitation of eating and drinking establishments, shellfish sanitation, insect control, rodent control, rural sanitation, air pollution, and plumbing.

The definition of sanitary engineering and the list of sanitary engineering activities indicate the sanitary engineer's need for a broad education based on a firm engineering background, broadened with biology, bacteriology, chemistry, hydraulics, modes of transmission and methods of control of disease, epidemiology and vital statistics, and crowned by professional courses specific for sanitary engineering such as water supply, insect control, and restaurant sanitation. It becomes more difficult to obtain a satisfactory sanitary engineering education in a four-year undergraduate course as the field of sanitary engineering broadens and the educational requirements expand. Although many engineering schools grant bachelor of sanitary engineering degrees, the present tendency is toward granting advanced degrees in sanitary engineering to graduates of a four-year engineering curriculum after they have completed at least one year of postbachelor study.

Sanitary engineering may be divided into four general lines of activity. The first includes planning, design, and construction. This line of activity is the province of consulting sanitary engineers, certain governmental agencies, and engineering organizations of some large corporations. The specific function of this group is to plan, design, and supervise the construction of structures and equipment which will accomplish the desired result at the least possible cost. A second activity is operation, which consists of operating sanitary engineering structures or programs, such as sewage treatment plants, water works, swimming pools, and rat and insect control programs. This group is usually employed by governmental agencies since most sanitary engineering works are owned and operated by cities, states, or the federal government. Industries are also constructing a considerable number of sanitary engineering works and are employing sanitary engineers to operate them.

The third line of activity is supervision and regulation. Almost all sanitary engineering works and programs are under the supervision of some governmental agency because of the great public stake in these activities. This group of engineers usually has no responsibility for the results obtained, but is responsible to determine what results are obtained, to evaluate the results, to promote improvements and to require, if necessary, the responsible person to take action to secure satisfactory results. This group depends on education for long-time results and has been responsible for many sanitary engineering improvements. There is a growing group in industry which performs this same function for management.

The three groups defined by their lines of activity, effectively assisted by the fourth group

consisting of the sanitary engineering equipment and material industry, comprise the team responsible for the high degree of sanitation now enjoyed by this country and many other nations.

Public Water Supply.—This refers to the collection, treatment, and conveyance of a bacteriologically safe and physically and chemically satisfactory water to domestic, commercial, and industrial consumers who require or can use water fit for human consumption. Standards for drinking water used by interstate carriers have been established by the United States Public Health Service and are generally accepted as minimum standards for drinking water throughout the United States. These standards specify the maximum number of coliform bacteria, and maximum concentrations of minerals, color, turbidity, tastes, and odors. Coliform bacteria are harmless bacteria normally found in the human intestine, and are used as indicators of fecal pollution.

Public water supplies may be privately or publicly owned. The cost of collecting, treating, and conveying the water is usually borne by the consumer in the form of a charge for the volume of water used.

Water can be obtained from under the ground or from the earth's surface. The source of all water is the rainfall. The quantity of water taken from underground and surface supplies over a period of years cannot exceed the rainfall (after deducting losses such as evaporation, transpiration, runoff and seepage).

Ground water is normally clear, cool, tasteless, odorless, bacteria-free, harder, and more highly mineralized than surface water. It is often bacteriologically safe, and chemically and physically satisfactory for domestic use as it comes from the ground, and is a valuable source of public water supply, especially in small towns. Ground water is sometimes too hard, and too highly mineralized for domestic consumption.

Surface water may vary from a clear, colorless, odorless, bacteria-free, soft, and slightly mineralized water, to one that is so turbid, colored, and highly polluted by sewage, and industrial wastes that it is practically impossible to make it into a safe, satisfactory drinking water. In general, it can be said that surface waters in populated areas will be contaminated and will require treatment to make them safe for drinking. This difference in surface waters results in a search for surface water supplies that are safe and satisfactory for use without treatment. Inasmuch as sources of water of this type are usually far removed from the desired point of use, an economic study usually has to be made to determine whether it will be less expensive to treat a nearby source, or to go farther away to a supply that will not have to be treated, but will have to be conveyed long distances.

Chemical coagulation, settling, filtering, and disinfection is a common form of treatment for removing color, turbidity, and bacteria from drinking water. Chemical coagulation consists of adding to the water small amounts of harmless chemicals which react with each other or the minerals in the water to form a light, feathery floc (precipitate) which is kept suspended for approximately 30 minutes and collects to itself most of the turbidity and considerable portion of the color and bacteria. The chemicals most commonly used for this purpose are alum (aluminum sulfate) and lime (calcium oxide or calcium hydroxide). The water then passes through a settling basin in which most of the floc with its collected impurities settles. After settling, the water is passed through a rapid sand filter, which removes the remaining suspended material. The water is now ready for disinfection which usually is accomplished with chlorine, in the United States. Ozone is used in certain parts of Europe, and will be used in one of Philadelphia's reconstructed water-plants. Many other water treatment processes are used, but this one serves to illustrate the principles involved.

Historically, the Chinese knew of the clarifying powers of alum many years ago. The slow sand filter was the first of the modern water purification processes and for many years in the 19th century was the only purification process available. The slow sand filter consisted of a three-foot bed of fine sand through which the water percolated at a slow rate. The slow sand filter is very efficient in the removal of turbidity and bacteria, but requires such large areas of filters that it is not economical.

Hardness is a measure of the amount of calcium and magnesium present in the water, and represents the soap-consuming characteristic of the water. It is necessary to remove hardness before the soap will act as a detergent. This can be done with soap, and results in the formation of scum on water. It can also be accomplished in water treatment plants at a much lower cost if the water is excessively hard. The problem of hard water softening has been partly solved by the introduction of chemical detergents which neither form scum nor are wasted in softening the water.

Water, after necessary treatment and pumping, is conveyed to the consumer through pipes called a distribution system. A pressure of 70 pounds per square inch is desirable in the distribution system in order to supply water to five-story buildings, and for fire protection. It is interesting to note here that, although the total amount of water used in fighting fire is negligible over the period of a year, the portion of the cost of the distribution system chargeable to fire fighting may be as high as 75 per cent. This is due to the fact that fire departments demand large quantities of water in cities. The distribution system costs chargeable to fire protection are often paid as a hydrant rental fee from general taxes to the water company or department. Fire protection is a reasonable charge against the property owners, rather than the water consumers.

Water distribution systems also include reservoirs which are used to permit economies in the operation of pumps and treatment plants, and to provide an emergency supply that can be used in case of a breakdown of equipment. In this connection, it should be emphasized that public water supplies must provide safe water, and they must be dependable.

The standards for industrial water are variable, depending on the industrial process, and are sometimes the same, or less strict than drinking water standards (in which case the public water supply is satisfactory). In instances where the drinking water does not meet the industrial water standards, it is usually too highly colored, too highly mineralized, too hard, or contains minute traces of chemicals that react unfavorably in the industrial process. Industries requiring water with special characteristics must give the municipal water more treatment or develop supplies of their own that meet their special requirements.

Sewerage.—Sewer systems are the systems of pipes and appurtenances which carry waste water to a point of disposal. They may be either separate or combined. The separate sewer system has two systems of pipes, the sanitary sewer, and the storm sewer. The sanitary sewer carries sanitary sewage which is composed of domestic sewage (from homes), commercial, and industrial sewage. The storm sewer carries surface water run off and roof drainage. The combined sewer system has only one system of pipes (called a combined sewer) and carries sanitary sewage, surface water run off and roof drainage. Sewers also carry infiltration water which seeps in through joints and breaks in the sewer. The separate sewer system is recommended since it avoids difficulties of disposal inherent in the combined system, unless future disposal requirements can be met, and there is a significant economic advantage in the construction of combined sewers. Some states have made it unlawful to construct combined sewers. Sanitary sewers are at least eight inches in diameter and are designed to produce a minimum sewage velocity of two feet per second. Sewage is 99.95 per cent water, and is considered as water for hydraulic computations. Sanitary sewers are at least eight feet underground in order to receive basement drainage by gravity. Sewers usually start on the highest ground and follow streets down natural slopes to the point of disposal. The sewer system resembles a great tree with its roots at the point of disposal and its branches spreading to reach sewage at outlying points. Although sewers are intended to flow by gravity, topography sometimes requires that the sewage be pumped to save deep trench excavations or to transfer the sewage to an adjacent watershed. The most common appurtenances in a sewer system are manholes which are used to gain access to the sewer, especially for cleaning.

Sewers are constructed to carry away the liquid wastes of the community and, in general, all wastes are accepted. Some exceptions must be made in order to prevent explosions, corrosion, clogging of sewers, and insurmountable difficulties in treating the sewage. A partial list of materials commonly excluded from the sewers includes mineral oil, grease, inflammable liquids (such as gasoline and naphtha), sand, cinders, highly acid materials, and high concentrations of copper and cyanides.

Stream Pollution Abatement.—Stream pollution is any degradation of stream waters by run off from inhabited areas, eroding soil, sanitary sewage, industrial wastes and, in fact, by any liquid or material not naturally present in the stream. The word stream is used to represent any natural water. Stream pollution produces many effects.

The numbers of fecal bacteria will be increased by the sanitary sewage, sometimes by industrial wastes and, to a lesser degree, by storm sewage and run off from inhabited areas. This pollution can make the stream dangerous for water supply, swimming, and for shellfish culture.

The dissolved oxygen in the stream is reduced, as bacteria and biological life use dissolved oxygen, when they oxidize unstable compounds in the stream. The rate of use of dissolved oxygen is chiefly a function of the amount of pollution present and the temperature of the water. The stream resists the reduction of the dissolved oxygen by its ability to take oxygen from the atmosphere, and by the ability of various water plants and microorganisms to give off oxygen to the water as they grow. The most serious oxygen reduction usually occurs in the summer when the rate of use of the oxygen is the greatest and the rate of absorption from the atmosphere is least. The ability of a stream to replenish its dissolved oxygen is strictly limited and can be exceeded easily. The reduction of dissolved oxygen has two principal effects: first, the death of fish as the dissolved oxygen is reduced to fifty per cent of maximum; second, the production of hydrogen sulfide and other odors by anaerobic bacteria, which is not usually noticed until the oxygen is depleted.

Stream pollution may produce sludge banks which are formed by the settling of suspended solids near the point of pollution. Anaerobic bacteria act on the sludge bank material with the formation of methane, carbon dioxide, hydrogen sulfide, and other noxious gases. Bubbles and sludge may be observed rising to the surface when digestion is at a peak during warm weather. Other effects of stream pollution are nuisances created by noisome floating objects, grease on beaches, discoloration of water, destruction of all stream life, toxic pollution, and destruction of boat hulls by action of acid wastes.

Natural purification forces, in addition to reoxygenation, are settling, bacteriological and biological action, and dilution. Natural purification is sufficient to eliminate the effects of any degree of pollution providing the stream is long enough and is not recontaminated. This process may involve miles of stinking, useless water if the pollution is severe. Such pollution should not be allowed to occur and, if it exists, it should be abated. If pollution is to be abated, what standards of stream condition should be established? This question cannot be answered without studying carefully the specific location under consideration, but general principles can be given. The problem is the allocation of stream resources between its various uses, such as water supply, irrigation, swimming, fishing, boating, water power, recreation, and the disposal of sewage and industrial wastes. The difficulty of determining the relative value of the various stream uses, and the fact that considerable use of the stream for sewage and waste disposal can be made without interfering with other stream uses, has resulted in stream standards being set so that stream pollution will not interfere with any other stream uses. This general rule is modified in industrial and metropolitan areas by the fact that it is financially impossible to recover some of the stream uses which have been lost. This is especially true in metropolitan areas served by combined sewers which overflow at each rain and send slugs of pollution downstream. It is true that some industrial wastes cannot be treated economically at present. The modification of the general rule results in grading of streams by stream pollution abatement authorities into various classifications which represent the highest use that can be expected for each stream after all practical steps have been taken to eliminate pollution. It is characteristic of these standards that they tend to rise as new methods of eliminating pollution become available, and the public demands, and willingness to pay for pollution abatement increases. Abatement of pollution requires large amounts of money and will take years to accomplish.

Power to control pollution abatement has rested entirely with the individual states. They have set up authorities consisting of representatives of public health, conservation, agriculture, the public, and industry. Action by these authorities is often necessary to secure pollution abatement since the industry or municipality causing pollution does not necessarily benefit by its abatement. The benefits accrue to their downstream neighbors. It has been established, however, that the industry or municipality causing pollution is responsible for its abatement. Most states have now halted the increase in stream pollution and are gradually reducing existing pollution. A bill passed in the 1948 session of Congress gives the United States Public Health Service power over pollution of interstate waters.

Sewage Treatment.—This is a pollution abatement process placed between the sewers and the stream so that the sewage will not pollute the stream beyond the limits allowed by stream standards. If the stream is large, and the pollution relatively small, there is no need for treatment. On the other hand, if the pollution is relatively great, and the receiving stream small, a high degree of treatment may be required and can be provided. Any treatment in addition to the minimum required by stream standards results in unnecessary expense. Stream standards have a tendency to become more rigid with time, so that provisions should be made for adding treatment units as required with a minimum of expense. Sewage treatment is usually divided into primary treatment, secondary treatment, and disinfection.

Primary treatment consists of screening to remove large materials, grit channels to remove sand, gravel, fruit pits, and so forth, and settling, and floatation to remove suspended materials. Screening and grit removal are used to prevent damage to equipment and clogging of pipes, and actually remove very little polluting material from the sewage. Settling is very effective in removing suspended solids which will settle or float. Settling is accomplished by flowing sewage slowly through a settling tank. The sewage remains in the tank for one to four hours. Primary sludge is removed from the bottom of the tank, floating material is skimmed from the surface and the remaining liquid flows on to disposal or additional treatment. Primary treatment will remove about 60 per cent of the suspended solids and 30 per cent of the oxygen demand.

Further reduction of suspended solids or oxygen demand is provided by *secondary treatment*, which is an oxidation performed by bacteria and microorganisms in the presence of dissolved oxygen. Three common types of secondary treatment are activated sludge, trickling filters, and intermittent sand filters. The activated sludge process consists of applying air to settled sewage for four to eight hours during which time much of the oxygen demand of the sewage is satisfied, and much of the colloidal and dissolved solids are changed to a form which will settle. The aerated sewage passes through a settling tank from which clear supernatant is discharged to a stream. The activated sludge which contains the biological flora responsible for oxidizing the sewage is removed from the settling tank bottom, and recycled to the aeration tank where it is mixed with more settled sewage, aerated, and resettled. The build-up of activated sludge takes about a month, after which some of the activated sludge has to be wasted. The trickling filter is essentially the same as the activated sludge process except, instead of building up a biological flora in floating sludge, it is built up on two- to four-inch stones, and the sewage is passed over it in thin sheets. A settling tank also follows the trickling filter but the sludge which settles is not recycled. The high rate trickling filter is a modern adaptation of the trickling filter whose distinctive characteristic is multiple passage of the settled sewage through the filter at a high rate with the resultant greater pollution reduction per volume of filter. The intermittent sand filter consists of a sand bed about three feet deep on which sewage is discharged. The sewage is purified to a pure, sparkling effluent as it percolates through the sand, and is acted on by the biological flora contained therein. No settling tank is required after this filter. The activated sludge process and the trickling filter are used generally for sewage treatment while the sand filter is used only for small installations because of the great area it requires.

Sludge (concentrated sewage solids) is produced in both primary and secondary treatment and is disposed of in several ways. The sludge may be partially dewatered on rotary vacuum filters, incinerated or dried, and sold as fertilizer. It may be discharged to a digester, and stabilized by anaerobic bacteria in approximately 30 days, with the production of methane and carbon dioxide gas. The digested sludge may be vacuum filtered or air-dried on sand beds and used as a low-grade fertilizer, or just dumped on waste land. The value of sewage sludge as a fertilizer varies with the sludge and the method of processing. Primary sludge contains grease that makes it unsatisfactory for fertilizer. Activated sludge and digested sludge are both satisfactory with the activated sludge containing larger amounts of nitrogen. One of the valuable byproducts of digestion is sludge gas, which contains about 60 per cent methane and has a heat value of about 600 BTU per cubic foot. Sludge gas will supply all of the heat required and part of the power required, for operation of the sewage treatment plant. The use of gas for heat and power, and the sale of sludge as fertilizer will reduce the cost of sludge disposal and, under favorable circumstances, will contribute something toward the operation of the rest of the plant, but it cannot be expected to turn the sewage treatment plant into a money-making venture.

Many other sewage treatment processes have been proposed or used. Those described are typical, and serve to illustrate the principles involved. Two additional processes will be described because of their historical importance. They are the septic tank and the Imhoff tank. Both tanks combine settling and sludge digestion and are used for primary treatment. The septic tank is older and combines settling and digestion in a one-compartment tank. As the sludge digests, the gas rises through and interferes with settling of solids in the sewage, with the result that the septic tank sometimes accomplishes very little in the treating of the sewage. The septic tank is cleaned from time to time by the removal of sludge from its bottom. It has been relegated to primary treatment for single-family houses, and for small numbers of people, usually less than one hundred.

The Imhoff tank has two compartments and separate settling and digestion, with the result that excellent removal of solids from the sewage

is accomplished. The compartments are arranged, one above the other, so that sludge settling from the sewage automatically falls into the digestion compartment. Sludge is removed from the digestion compartment from time to time as digestion is completed. Imhoff tanks have been, and will be, in wide use in small and medium sized cities where this type of treatment is more economical than the separate sedimentation and sludge digestion previously described.

Bacteria present one of the greatest dangers caused by sewage pollution of streams. Sewage treatment will reduce the numbers of coliform bacteria in the range of 80 to 99 per cent. This is not sufficient. The most effective method available for killing bacteria is *disinfection* with chlorine. Chlorine is usually brought into the sewage treatment plant as a liquid, and fed into the sewage as a water solution. It is most effective when applied to the sewage treatment plant effluent, but is often applied to other places in the treatment process to effect odor control as well.

Sewage treatment is much more complicated than this brief presentation can indicate and requires a man of considerable ability and enthusiasm to operate the simplest municipal sewage treatment plant. A large sewage treatment plant may be likened to an industrial plant with a technically qualified administrator, many technical specialists, and alert workers.

Industrial Waste Treatment.—Industrial wastes are here prepared for disposal. The processes used for treating sanitary sewage may be used for some industrial wastes. In fact, many industrial wastes are discharged into public sewer systems and treated in municipal sewage treatment plants. If the ratio of sanitary sewage to industrial wastes is great, then little difficulty is experienced. All industrial wastes cannot be treated by conventional sewage treatment processes, and some cannot be treated by any process now known. Industrial wastes are as varied as the industries producing them. Some industrial wastes are not merely waste materials, but often contain small amounts of the material the industry is producing. This opens the field of industrial waste treatment to partial solution by improved industrial processes and byproduct recovery. There is no single process which can be applied to the solution of industrial waste treatment problems, but there is a general procedure to be followed in attacking the problem.

The first step in the solution of any industrial waste problem is to adjust the industrial process to reduce the strength and volume of the wastes produced. This step was promoted very effectively by the State of Wisconsin in its program to reduce the pollution of its streams. Waste surveys showed that paper mill wastes contained tons of fiber worth many dollars. Screens were installed, much of the fiber was saved, and stream pollution was reduced. In other industries, process water can be re-used with a reduction in the volume of wastes. When process adjustments and changes have accomplished their maximum good, wastes should be examined for byproduct recovery. Byproduct recovery in the brewing and distilling industries has resulted in a profit from the sale of cattle feed produced. Byproduct recovery may be less expensive than waste treatment, and should be used as long as the byproduct recovery net cost is less than the cost of waste treatment. Most byproduct recovery processes produce wastes which are less objectionable than the original waste, but which will have to be treated prior to disposal.

When the two above lines of investigation have been exhausted, there remains the task of determining the most effective, least expensive treatment. The strengths, chemical characteristics, and volumes of each of the wastes produced in the plant must be determined. The wastes must be studied individually and collectively to determine whether they should be treated separately or be combined in some way prior to, or during, treatment. Chemical precipitation and settling of industrial waste is a common first treatment. A biological treatment is often required to obtain a higher degree of purification. The trickling filter, especially the high rate modification, is commonly used for biological treatment of industrial wastes, since it withstands, and recovers from, the great variations in volume and strength characteristic of many industrial wastes. Some wastes contain toxic materials which make biological treatment difficult. Ingenuity and imagination pay great dividends in the solution of industral waste problems.

A special problem is created by wastes from seasonal industries such as canneries and beet sugar plants. It is economically difficult to provide equipment and tanks to treat properly the large volumes of strong wastes which may be produced for a few months of the year. Many of these industries remove suspended solids from their wastes by screening or settling, and store the settled wastes in large artificial ponds called lagoons. Purification is accomplished biologically at a slow rate. Nitrates are added to the lagooned wastes to prevent odor production. The wastes are held in the lagoon until natural purification has reduced the strength to a point where they can be safely discharged to the receiving stream, often during high spring flows.

Many industries have sponsored study of their wastes to determine economical methods for waste treatment. Processes have been developed for the treatment of wastes which were essentially untreatable a few years ago. This action by industry is encouraging since it reflects industry's acceptance of industrial-waste, pollution-abatement responsibility. We may expect, however, that considerable time will pass before economical waste treatment processes are developed for all industries, and industrial waste stream pollution is reduced to permissible amounts. New industrial processes produce new wastes, often temporarily untreatable. We may look forward to the time when an industrial process is not considered complete or usable until methods for the treatment of wastes are perfected.

Refuse Collection and Disposal.—Refuse is composed of garbage, rubbish, and ashes. Garbage is composed of table scraps, materials produced during the preparation, cooking and serving of food, and similar wastes from other sources. Rubbish is combustible material such as paper, wood, grass, shrub trimmings, and, sometimes, includes incombustible material such as metal and tin cans. Ashes are the residue from the burning of solid fuel. The exact classification of garbage, rubbish, and ashes depends on local definitions writtten to aid the collection and disposal of the refuse. The sanitary engineer is interested in refuse because garbage is an excellent breeding place for flies, and may also serve as a source of disease bacteria which flies and rodents can carry to susceptible persons. He is

interested in the other components of refuse because garbage is often mixed with them, and because all refuse often is collected and disposed of by the same organization.

Garbage should be stored and transported in watertight and fly-tight containers. Garbage should be collected at least twice a week during warm weather and, at least once a week, during cold weather. Garbage may be collected by municipal collecting crews and equipment, by contractors paid and supervised by the city, or by scavengers paid by the home owners. Collection by unsupervised scavengers often creates unsanitary conditions because these persons lack knowledge of, or disregard, sanitation principles. Refuse containing significant amounts of garbage must be treated as garbage.

Rubbish should be stored in containers which will prevent scattering by the wind. Rubbish usually is collected once a week. The collection trucks should have a great volumetric capacity in order to collect a reasonable weight of this bulky material, and should be covered to prevent scattering by wind or motion of the truck. Trucks with watertight metal bodies, and provided with loading and load-packing devices, so arranged that the load is never uncovered, are available and are recommended.

Ashes are collected weekly in some communities; once a year in others. Ashes should be stored and handled to minimize dust nuisances.

The methods used for the disposal of refuse are incineration, sanitary fill, hog farms, reduction, land dumps, dumping at sea, and disposal at sea. All methods can be applied to garbage, but only some can be applied to rubbish and ashes.

Incineration consists of drying and burning the refuse in specially constructed furnaces called incinerators. Refuse is prepared for incineration by separating the garbage and refuse from the noncombustible materials. This separation is accomplished at the source. Garbage and rubbish, alone or in any combination, may be incinerated. The incinerator should incinerate or store the refuse as fast as it arrives. Collection trucks bring the refuse to the incinerator and dump it into a storage bin, from which it is fed to the incinerator at a rate giving efficient incinerator operation. Salvageable materials, or materials which may damage the incinerator are often removed prior to incineration. Much of the odor produced by some incinerators is associated with careless storage and handling of the refuse prior to incineration. Gases leaving the incinerator are heated to approximately 1,200°F. to destroy all odors. Incinerators can be operated with little smoke, but in critical areas, equipment may have to be installed to reduce the fly ash content of the stack gases.

The sanitary fill is an approved method of disposal for refuse. A sanitary fill is started by digging a trench approximately eight feet deep, fifteen feet wide, and as long as convenience dictates. Refuse is hauled to the fill, dumped into the trench, and compacted. When the refuse has built up to within three feet of the final grade, the top and faces of the refuse are covered with material excavated from a trench parallel to and just beyond the original trench. Dumping is restricted to a length of trench which will be filled in one day. The process of filling and covering is carried down the length of the trench, until the original trench is completely filled at which time there is another trench just beyond the original trench waiting to be filled. A dragline is required to dig the trench, and to compact and cover the refuse. A bulldozer is used to level the top of the fill for truck traffic, and to assist in compacting the refuse. The sanitary fill creates only one nuisance, the scattering of papers at the time of dumping. This nuisance is controlled by erection of fences to collect these papers, and by constructing movable windbreaks to protect the dumping trucks from the wind. The cost of sanitary fill disposal is less than incineration, if suitable land is conveniently located to make the collection haul short. Such land is quickly used in large cities. Several cities, which have abandoned incineration for sanitary fill disposal as an economy measure, have used up the conveniently located areas and are now faced with the use of incinerators to replace the sanitary fill which has become more expensive. In other words, as the nearby sites for sanitary fill are depleted, the extra cost of hauling to more remote sites is more than the savings in disposal costs. Land made by sanitary fills is useful as parks but should not be used for building sites. Explosive methane gas is produced by digestion of the refuse in the fill. The rate of evolution of the gas is so slow that no hazard is created unless buildings placed on the fill accumulate the gas. Several buildings placed on fills have suffered from explosions.

Hog feeding is often used for the disposal of garbage. The production of meat from garbage is a conservation practice which is popular and which may reduce the cost of garbage disposal, but which can be a health hazard if not properly supervised. The garbage must be carefully separated at the source to remove glass and other materials harmful to hogs. The garbage is hauled to receiving stations in the collecting trucks, and is transferred to larger trucks or trains for transportation to the hog farm. The long haul to an isolated farm may make the collection costs excessive. The garbage is placed on concrete platforms, and the hogs allowed to pick it over for several hours. The garbage residue, together with hog manure, is removed, spread on land, and plowed under as a humus. This requires large areas which are often used in rotation to grow grass and grains for supplementing the garbage diet of the hogs. Garbage-fed hogs should be fed grain for a few weeks prior to slaughter to produce a more acceptable meat. Hogs are susceptible to disease, must be immunized against hog cholera, and should be supervised by a veterinarian. Hogs fed on garbage are more likely to be infected with trichinae worms which cause trichinosis in humans. Garbage-fed hogs should be carefully inspected at the slaughterhouse to prevent sale of infected meat. Trichinae worms can be minimized by sterilizing the garbage prior to feeding. In fact, the United States Public Health Service prohibits the transportation of raw garbage across state lines if the garbage is to be used for feeding hogs. Sterilizing the garbage is expensive, is reported to make the garbage less palatable to hogs, and is accepted by few hog feeders. The odors characteristic of hog farming can be reduced by good housekeeping but cannot be eliminated. Fly breeding is also very difficult to control. This discussion of hog feeding is based on large farms using the garbage of a city, and is applicable only in part to hog farms feeding a few hogs.

Land dumping may be the most common ref-

use disposal method. It consists of dumping the refuse on the ground. For convenience, the dump is usually started at the top of a slope. Some dumps are intended only for rubbish and ashes. Practically all dumps, regardless of intent, contain liberal amounts of garbage. Decomposition of the refuse and dump fires create overpowering odors. Dumps support large numbers of rats, and keep the surrounding area infested. Dumps also produce swarms of flies which invade neighboring areas and carry filth from the dump to the dinner tables in nearby homes. Land dumping is probably the cheapest, most unsanitary, and greatest nuisance producer of all disposal methods. It is recommended only for the disposal of ashes and other noncombustible material which is free of rubbish and garbage.

Dumping at sea has been used by some seacoast cities with indifferent success. There is a tendency for some of the garbage to float to shore and beaches unless it is hauled a long distance to sea. This may be more expensive than some other disposal method.

Disposal of garbage with sewage is relatively new. Some cities collect the garbage and haul it to central grinding stations where it is ground and discharged into the sewer for water transportation to the sewage treatment plant. Other cities haul it to the sewage treatment plant, grind it and introduce it into the sewage treatment process. Householders may install garbage grinders under the sink as part of the plumbing. Garbage is accumulated in the grinder by pushing it down the sink drain, and is ground and flushed down the sewer as required. The home garbage grinder and sewer is the most sanitary garbage collection system known. Experience with this method of disposal indicates an increase in sewage flow of 10 per cent but no harmful effects on the sewer. The home garbage grinder also increases the organic load applied to the sewer treatment plant, and, if used widely, will require expansion of the secondary treatment and sludge handling facilities. The only problem here is a quantity problem which can be solved merely by expansion.

Space is not available to cover many of the other phases of sanitary engineering. However, many of these phases, such as milk production, rat control, and insect control, are covered elsewhere in these volumes.

Ariel A. Thomas,
Assistant Professor of Sanitary Engineering, Massachusetts Institute of Technology.

SANKARAN NAIR, sŭng'kà-rân nä'yĕr, Sir **Chettur,** Indian jurist and statesman: b. Malabar, India, July 11, 1857; d. April 24, 1934. He was educated at the Madras Presidency College and chose a career in law. He served as vakil (native public pleader) of the high court at Madras, and in 1899 became government pleader and public prosecutor to the government of Madras. During this period he interested himself in social reform, coming to advocate a gradual development under British leadership. He presided over the 1897 session of the Indian National Congress and at a number of congresses and exhibits which sought to improve social conditions and to promote Indian industry. He was the founder of the *Madras Review* and *Madras Law Journal.* For many years he was a member of the Madras Legislative Council, in 1907 he became Madras advocate general, and in 1908 a puisne (associate) judge of the high court there. From 1915 to 1919 he was secretary of education in the governor general's council, being one of the first Indians to hold a portfolio in that body. He was knighted in 1912. Sankaran Nair remained politically independent, and he supported the plan advocated in the Montagu-Chelmsford report (April 22, 1918) which proposed that participation in the government be gradually extended to Indians in successive stages, with a view to the definitive inclusion of India in the British Empire. This brought about his appointment to the Indian council (1920–1921) in England and completed the rift between him and the advocates of noncooperation, among whom was Mohandas Gandhi. Sankaran Nair's book *Gandhi and Anarchy* (1922) was a strong attack on his adversaries. He became a member of the Council of State of India in 1925.

SANKEY, Ira David, American evangelist: b. Edinburg, Pa., Aug. 28, 1840; d. Brooklyn, N. Y., Aug. 13, 1908. His introduction to music took place at an early age, his family being musically inclined. After leaving high school, he was engaged as a clerk in a bank at Newcastle, Pa., of which his father became president in 1857 and, after serving with the Union Army in the Civil War, he again took a position with his father, now a collector of internal revenue. Meanwhile, however, Sankey had sung in the choir of the Methodist Church at Newcastle and had been chosen its choir leader and superintendent of its Sunday school. He was also active in the Young Men's Christian Association, and was made a delegate to its convention at Indianapolis in 1870. It was here that he met Dwight L. Moody (q.v.), the evangelist with whom he was intimately associated until Moody's death in 1899. In 1873 they went to the British Isles to conduct evangelistic services. Sankey's contribution was his singing. Although his voice was not a great one, the simplicity and expressiveness of his singing moved audiences profoundly. What began as a modest and unheralded effort, ended as a triumphant religious awakening, and when the evangelists returned to the United States in 1875 the foundations for many successful campaigns had been laid. Royalties from their very popular hymn collections, *Sacred Songs and Solos* (1873) and *Gospel Hymns* (1875–1891) were surrendered, largely in the interest of the Northfield (Mass.) School. Sankey also wrote *My Life and the Story of the Gospel Hymns* (1906).

SANKHYA, sän'khya, the name of a philosophical system of ancient India. It is attributed to a writer by the name of Kapila, about whom we know absolutely nothing. While the extant texts do not date back much further than 1380 A.D. Sānkhya writings are known to have been translated into Chinese in the 6th century, and the inception of the school is probably considerably earlier. The philosophy is strictly a dualism, and indeed the name of the school may be translated as "pluralistic." The *Prakriti,* or matter of the universe, is opposed to the *Purushas,* or souls, of which there are an unlimited number. The *Prakriti* assumes eight

forms and 16 modifications. That deliverance from continual rebirth which constitutes the goal of all Indian philosophy is attained, according to the Sāṅkhya (Sāṃkhya) school, by a complete knowledge of the soul principle and of the 25 modifications of matter. This deliverance consists in the separation of the soul principle from its pain-giving material environment. The material world has a certain history determined by its very nature. It is tripartite, consisting of goodness, darkness and passion. These were primitively in an equilibrium which gradually becomes upset until a new equilibrium is formed and a new universe. Without the intervention of the soul (purusha) the matter or nature (prakriti) develops within itself a world intelligence. This generates consciousness, which by a gradual process of degradation gives rise to the cruder matter forming the object of our experience. Thus the entire psychical life, in so far as it may be analyzed and expressed in discourse, is derived from the matter constituent of the universe rather than from the soul constituent. The method in accordance with which the individual soul comes into contact with a particular part of the material universe is by no means clear. In whatever context it occurs, the soul is unmoved by emotion, without will, and entirely absorbed in a cognition which has no object. Notwithstanding its inactivity, it stimulates the material body consciousness complex into will, emotion, and the knowledge of definite objects. Since to the Indian mind the notion of consciousness is inseparable from that of pain, the union of soul and body in life is by its very nature painful, so that the purpose of philosophy is to interrupt the continual imprisonment of the soul in one body after another. As has been said, the Sāṅkhya philosophy maintains that when the distinction between the psychical and the material is clearly envisaged throughout the universe, this distinction becomes a real distinction as well as a conscious one, and the soul lapses into the unconsciousness of a trance. SANNAZARO, sän-nä-dzä′rô, **Jacopo,** Italian poet and epigrammatist, descendant of a noble family of Spanish origin: b. Naples, Italy, July 28, 1458; d. there, April 27, 1530. After study under A. Pontano (Pontanus), he was admitted to the Arcadian Academy as Actius Sincerus, the name he selected to be known by, according to the prevailing custom. He spent several years in foreign travel and on his return to Naples soon became famous as a poet and courtier. His verse attracted the attention of King Ferdinand I of Naples and his sons Alfonso and Frederick. The last named when he ascended the throne as Frederick III in 1496 gave him the villa of Mergellina with a pension of 600 ducats. In 1501, when Frederick was forced into exile by Louis XII, Sannazaro accompanied him and remained with him until his death in 1504. During this period he completed his famous *Arcadia,* a pastoral poem published in 1504, which passed through 60 editions before the close of the 16th century, and was largely imitated. His subsequent works include *De partu Virginis* (1526), a Latin poem which earned him the title of the "Christian Virgil"; and his collected *Sonetti e canzoni* (1530). His elegance of expression, no less than the poetical beauty of his thoughts, give him a distinguished place among the Latin poets of the Renaissance.

SANSEVIERIA, săn-sĕ-vēr′ĭ-ȧ, is a genus of about 60 species of herbaceous perennials, commonly called bowstring hemp, found in tropical and South Africa and the East Indies, and belonging to the lily family (Liliaceae). The characteristic basal rosettes of sword-like leaves arise from creeping rootstalks. The leaves yield a strong, white, elastic fiber (bast fiber), mostly obtained from wild plants and widely used by natives for mats, hammocks, bowstrings, and other crude cordage. Bowstring hemp has been in cultivation in India for a very long time. The fiber is usually removed by hand or mechanical devices. The most important species are: *S. thyrsiflora,* of tropical Africa, cultivated in Jamaica and Central America; *S. Roxburghiana,* of India; and *S. zeylanica,* cultivated in Ceylon and other tropical countries. About ten species are cultivated in the United States, mostly as porch or house plants.

SANSKRIT LANGUAGE, săn′skrĭt, the oldest stage of the Indo-Aryan subfamily of Indo-European. Bands of Indo-European speakers seem to have emerged from the country north of the Caspian Sea into the Middle and Near East in the first half of the 2d millennium B.C. Some of them, after various vicissitudes, settled in Iran and their language developed into the Iranian languages called Old Persian, Avestan, Middle Persian, and later Pahlavi, Persian, and others. The other branch seems to have experienced various wanderings. From proper names and other material in their records some are known to have formed an element in the Mitannian and Kassite kingdoms of northern Syria and Mesopotamia (c.16th–14th centuries B.C.). Their much better known linguistic brethren went east toward India and invaded the Indus Valley probably in the first half of the 2d millennium B.C.; the chronology is very uncertain. Here these horse and cattle nomads seem to have met a people with a highly developed urban civilization (the Harappa culture), and apparently destroyed what they found but enslaved the people of the old culture.

The invaders were Indo-Aryan speakers, and the indigenes were possibly Dravidian speakers. The Indo-Aryans finally settled for a time in the Punjab (Upper Indus Valley) and here produced at least the earlier parts of the Vedic ritual literature. (See VEDIC LITERATURE.) They spoke a number of dialects, one of which is the nucleus of the old Vedic language. There are, however, traces of other dialects in this literature; for example, it is usually held that both *l* and *r* of Indo-European became *r* in the basic Vedic language, but that in another dialect of the time both *l* and *r* became *l,* and that some words with *l* were borrowed from this dialect into the basic Vedic language.

As time went on within the Vedic period, which probably is to be considered as ending about the middle of the 1st millennium B.C., there was expansion of the Indo-Aryan speakers eastward down the Ganges Valley. In time and in space new dialects evolved among all classes of the people. The language spoken in everyday life diverged more and more from the old language of the ritual, and even before the end of the Vedic period many speakers of Indo-Aryan were using

dialects which had features later found in Middle Indic (Prakrit). Some forms of this type were even used when new ritual literature was composed, and some of the latest ritual compositions were included even in the first of the compilations known as the Vedas, the Rig Veda (*Rgveda*). There was also borrowing into the Vedic language of words from the Dravidian languages of the aborigines, whether they were the people of the Harappa culture or were merely the inhabitants of the Ganges Valley whom the invaders met in their eastward expansion.

A concern for verbal accuracy in ritual utterances seems to have troubled the Vedic peoples very early. At some time in the Vedic period this concern led to the growth of a technique for preserving accuracy, namely grammar, in the sense of describing accurately the sounds and forms of the desirable utterances, and in the further sense of prescribing what was desirable and teaching what was to be avoided. A long series of Vedic grammarians (their works are the *Prātiśākhyas*) culminated, through stages whose details are far from certain, in Pāṇini (c.5th century B.C.). He, however, described in his famous grammar (the *Aṣṭādhyāyī*, "the eight-chaptered work") his own spoken language, which was not quite the same as the old Vedic and was also not yet the Middle Indic which some communities were already speaking. He was interested in some Vedic forms, but gave them only as divergences from the dialect which he spoke and which he was primarily interested in describing. His language was as much a true Old Indic as was Vedic, but it was a somewhat different dialect. We can localize him as having been born in Salatura in what is now the North-West Frontier Province of Pakistan, but this throws little light on the nature of the local dialects of his time.

From Pāṇini's time on, spoken dialects diverged more and more from the norm he had described, but with minor exceptions all who wrote with an eye to acceptance by the learned followed his description. They wrote, and even learned in their schools to speak, in a literary language which was less and less the language of everyday life. To this literary language they gave the name Sanskrit (*saṃskṛta*), the "polished" or "cultivated" or "refined" or "perfected" language, as opposed to the everyday languages, which they called Prakrit (*prākṛta*), the "natural" languages. The literary Sanskrit, as the heir of the Vedic religious tradition, became the vehicle of Hindu culture and has remained down to the most recent times the language in which the traditional Hinduism of India has found its expression through its learned custodians, the Brahmans. The situation is very like that of Latin, which was the vehicle of the classical and medieval culture of Europe and still lives today in the liturgical and other writings of the Roman Catholic Church.

The two dialects of Old Indic, Vedic and Sanskrit, are in structure very like Latin and classical Greek. They have complex inflectional systems for nouns, adjectives, pronouns, and verbs. Nouns, adjectives, and pronouns have the categories of number (singular, dual, plural); gender (masculine, feminine, neuter); and case (nominative, accusative, instrumental, dative, ablative, genitive, locative, vocative). The Vedic verb has categories of voice (active and middle); mood (indicative, subjunctive, optative, imperative); tense (present and imperfect, perfect, aorist, future); number and person. The present stems of verbs show a large number of different types (formed by various suffixes and infixes, and by reduplication). In addition to the simple verb, there are secondary verb types—passive, causative, desiderative, intensive—and some combinations of these (for example, a passive of the causative), which show forms in most of the categories of the simple verb. Like the Indo-European languages in general, this language has many combinations of verb forms with adverbial prefixes, with the meanings of the combinations very often not obtainable by a simple addition (compare English *understand*). The Sanskrit verb system differs from the Vedic in that it shows fewer of the categories (for example, the subjunctive is almost totally disused, the aorists are moribund), but since Pāṇini taught much of the Vedic verb system, there was a tendency for learned literary men to use many of the strictly Vedic forms in order to show their learning. As in Latin and Greek, stems, suffixes, and prefixes often have several different phonetic forms depending on the phonetic surroundings in which they are found; this applies also to words within sentences: for example *nalo vadati* (Nala is speaking), *nalaḥ pacati* (Nala is cooking), *nalas tiṣṭhati* (Nala is standing), with three forms of the nominative singular meaning "Nala." Again, as in Latin and Greek, sometimes a number of different categories are carried by one unanalyzable form: for example, in such a form as *asmi* (I am) the unanalyzable suffix *-mi* is first person, singular number, present tense, indicative mode, active voice; and the same category is often represented by very different forms in different word classes.

This highly complex morphology was described by Pāṇini with such detail and yet with such systematic lucidity as was not achieved for the classical languages Latin and Greek or for the modern languages of Europe until recent times. When Sanskrit became known to Europeans toward the end of the 18th century, it was learned in the traditional way, through the medium of Pāṇini's grammar. With this systematic aid it was seen by Sir William Jones, and announced in 1786 in a famous address which he delivered in Calcutta, that Sanskrit, Greek, and Latin "have sprung from some common source which, perhaps, no longer exists." He suspected that the Germanic and the Celtic languages probably had the same origin. This was the seed from which sprang Indo-European comparative grammar, the branch of linguistics which sets forth in all detail the relationship posited by Jones. His "perhaps" has turned out to be "certainly." At times his clear vision was neglected and it was suggested that Sanskrit was really the "common source" of the other languages. After this was firmly proved to be incorrect, it was for a long time held that Sanskrit was at least more archaic in its sounds than the other languages of the group. Even this has turned out to be only partly correct. The vowel system of Sanskrit is less archaic than that of classical Greek (for example, *a, e,* and *o* of Indo-European have all become *a* in Sanskrit, but have remained separate in Greek), and its consonant system shows a good deal of change through palatalization and other changes; on the other hand, the Vedic language has preserved more traces of the old Indo-European system of semivowals than has any other of the languages.

In spite of all the Sanskrit changes, the systematic relationships of the Indo-European vowels were partially preserved in Sanskrit (the ablaut system), and the Hindu grammarians' systematic description of the relationships put scholars on the right path toward a lucid understanding of the much richer system seen in Greek. Sanskrit is only one of the Indo-European languages and not the one with the oldest records (Hittite holds that position with at least one document datable in the 17th century B.C.). The material, however, that Sanskrit yields for Indo-European studies and its historical role in those studies still make it one of the primary languages in that branch of linguistic discipline. SANSKRIT LITERATURE. This literature consists, to speak precisely, of works written in conformity to the vocabulary and grammatical usage advocated by the famous grammarian Pāṇini, who may have lived in the 4th century B.C. and whose perfecting (Sanskrit means "perfected") of the older or Vedic form of the Aryan language in India had become standard by the 2d century B.C. In contrast to Vedic literature (q.v.) Sanskrit writing, although characterized by much moralizing and philosophizing, is generally secular.

Because of redaction and late additions the ancient epics, the *Mahābhārata* (q.v.) and the *Rāmāyaṇa* (q.v.), have come down to us in Sanskrit dress. Somewhat resembling these in their heterogeneity and massive scope but without any straight line of narrative, we have in Sanskrit 18 famous *Purāṇas,* potpourris of legend and history, which treat of the creation of the universe, the genealogy of the gods and patriarchs, the reigns of the various Manus or lawgivers, and the history of the Solar and Lunar dynasties of Indian kings. Shorter if not more pointed narratives are the *Kāvyas* or artificial court epics, the most famous of which were written by Aśvaghoṣa, Kālidāsa, Bhāravi, Kumāradāsa, Māgha, and Rātnakara between the 1st and 11th centuries A.D. For the most part these art epics specialize not in storytelling but in elaborate descriptions of sunset and moonrise, mountain and forest scenery, love trysts, sacred bathing, and horrendous battles. They contain a tropical wealth of simile and metaphor set forth with unbelievable verbal acrobatics.

Other narrative writing in Sanskrit includes collections of beast fables (such as the *Pañchatantra* or *Book of Five Chapters*) in which animals play human roles and the prose is interspersed with excellent gnomic poetry in such a way as to make good behavior attractive to young princes. A talking bird dominates the *Suka Saptati* or *Seventy Tales Told by a Parrot* while a kind of zombie dispenses wisdom in the *Twenty-five Tales of a Vetāla.* Nearly all of the great Sanskrit story collections were gathered into a versified supercollection as the *Kathāsaritsāgara* or *Ocean of the Streams of Story* by Somadeva in the 11th century. Prose romances in the ornate *kāvya* style include the 6th century *Vāsavadattā* of Subandhu, Daṇḍin's 7th century *Ten Princes* and Bāṇa's *Kādambarī.*

Important lyric poetry in Sanskrit was written by Kālidāsa, Bhartrihari (7th century), Amarū (9th century), and Bilhaṇa (11th century), often in *śatakas* (collections of a hundred stanzas each) about love, though two 7th century poets, Mayūra and Bāṇa, are famous for *śatakas* about, respectively, the sun god Sūrya and the goddess Caṇḍī (Durgā). "The last great name in Sanskrit poetry" is that of Jayadeva (12th century), whose *Gitāgovinda* or *Song of the Divine Cowherd* (Krishna) is a lyric drama or opera.

It was in drama that Sanskrit literature achieved its highest perfection. Here the name of Kālidāsa stands unrivaled, followed by those of Bhavabhūti (8th century), Harṣa (7th century), Śūdraka (5th century), and Bhāsa (3d century). See also INDIA, SUBCONTINENT OF—*5. Literature.*

RODERICK MARSHALL.

SANSOVINO, sän-sō-vē'nō, **Andrea,** Italian sculptor: b. Monte San Savino, Tuscany, Italy, 1460 (whence he was familiarly known as Sansovino, his real name being CONTUCCI); d. Rome, 1529. He was a pupil of Antonio Pollaiuolo, and early formed his style on that of Leonardo da Vinci. It was under their influence that he produced such reliefs as the *Coronation of the Virgin; The Annunciation,* and the *Pietà.* In 1491 he was summoned by the king of Portugal to Lisbon, where for nine years he exercised his art as sculptor and architect. Returning to Florence in 1500 he carved the group of *Christ's Baptism* over the east portal of the Baptistery, which exhibited a nobility of form and expression unparalleled at that period, although he never completed the group. A statue of the Madonna and one of John Baptist for the cathedral at Genoa were his next works, and afterward he accepted a commission from Pope Julius III to execute the tombs of Cardinals Basso and Sporza for the choir of Santa Maria del Popolo. In these sepulchral monuments we see that the high-water mark of the 15th century art is reached; they are the most masterly sculptures of their kind that Rome possesses. In 1512 he completed his *Saint Anne with Two Other Saints* in the church of San Agostino in Rome. He was then entrusted by Pope Leo X with the decorations of the church at Loreto (1513–1529). Among the reliefs there the *Annunciation,* the *Nativity,* and the statue of *Jeremiah* are his own works; the rest of the decorations were produced under his direction by various artists. Nothing can be finer than the blending of classic severity with the freshness of Renaissance life in these figures which exhibit the results of a pure study of nature. Expression and action are full of deep feeling, yet not so emphasized as to overstep the line of modesty.

SANSOVINO, Jacopo (real name JACOPO TATTI), Italian sculptor and architect: b. Florence, Italy, 1479; d. Venice, Nov. 27, 1570. He took his name from the great artist who had been his teacher, and began his career in Florence where his first works of note were his statue of *Jacob* in the Santa Maria del Fiore cathedral and his marble *Bacchus* in the Bargello. Belonging also to this early period is a *Madonna*

and Child in the Church of San Agostino at Rome. In 1527 he went to Venice where his genius being quickly recognized he was appointed architect to the republic. His untiring labors from that time to his death have left his stamp both on the sculptural and architectural monuments of Venice. He is a brilliant example of the Italian artists in the noonday splendor of the Renaissance and in his architectural creations unites play of fancy and elegance of proportion with the most impressive and monumental dignity.

His preeminence as a sculptor is not so evident; his plastic work is often unpleasing and evidences a failure to master either the principles or the materials of his art, so that his work appears mannered and mechanical. His greatest successes in architecture are the *Corner Palace* (1532); the library of Saint Mark's, a splendid example of Italian Renaissance (1536); the Mint; and the churches of San Martin, San Giorgio dei Greci and San Giuliano. The *Burial of Christ* and the *Resurrection,* are fine reliefs on the bronze doors of the sacristy of Saint Mark's, and among other plastic works of his are a sitting figure of *St. John* in Santa Maria dei Frari; the statues of *Hope* and *Love* on the tomb of the Doge Venier in San Salvatore; and the gigantic figures of *Mars* and *Neptune* in the Doge's palace.

SANTA ANA, săn'tà ăn'à, city, California, and Orange County seat, alt. 133 feet; on the Atchison, Topeka and Santa Fe Railroad, the Southern Pacific Railroad, and the Pacific Electric Railway; by rail, 34 miles southeast of Los Angeles; has an airport. It is the trading center of the Santa Ana Valley. Packing and canning, and beet-sugar refining, are its leading industries. Great quantities of chili peppers, pimentos and walnuts are shipped from here. The principal manufactures are woolen goods, glassware, and agricultural implements and machines. In addition to the public school system, with two junior high schools and one senior high, there are parochial and trade schools, and Santa Ana Junior College. The city has several hospitals, a public library, and a museum with collections of relics of the early days of California. Santa Ana was founded in 1869. Pop. (1940) 31,921; (1950) 45,533.

SANTA ANA, city, El Salvador, capital of the Department of Santa Ana, departmental capital, on International Highway, 32 miles northwest of San Salvador and the Pacific port of Acajutla. It is a well-built city, the second in size of the republic, and lies about 2,100 feet above sea-level, in a mountain-encircled valley, abounding in coffee and sugar plantations, and forests. The Doric church, municipal building, hospital and military barracks are the principal buildings. There are numerous manufactures of domestic commodities and an active export trade in coffee and sugar, which increased considerably after the railway reached the city in 1900. Pop. (1950) 51,676. In the vicinity is Santa Ana (Izalco) 6,700 feet high, the loftiest volcano in the republic.

SANTA ANA INDIANS, a Pueblo tribe of New Mexico. See KERESAN.

SANTA ANNA, or **SANTA ANA,** săn-tä ä'nä, **Antonio López de,** Mexican general and politician: b. Jalapa, Feb. 21, 1795(?); d. Mexico City, June 20, 1876. He entered the army at 15, and attained public prominence as a supporter of Iturbide in 1821. The following year, after having expelled the royalists from Vera Cruz, he took command in that city, where he led a revolt (Dec. 2, 1822), which hastened the retirement of Augustín de Iturbide, who had made himself emperor. After the defeat of the Federal Party in 1822 Santa Ana retired to his estate; but he emerged again in 1828 in support of Vincente Guerrero's claims to the presidency, in which the latter supplanted Anastasio Pedraza. In 1829 the Spanish invasion furnished Santa Anna a favorable opportunity, and as minister of war and commander in chief at the head of the Federal forces he compelled Barradas to capitulate at Tampico, September 11. He soon joined with Anastasio Bustamante in overthrowing Guerrero, and setting up the former in his place, but also, in 1832, led in the overthrow of Bustamante himself, and the restoratoin of Pedraza. In 1833 Santa Anna was chosen president, and soon after renounced the party of the Federalists and put himself at the head of the Centralists, who desired the centralization of power in the executive government. His popularity with the army was not shared in by the nation at large, which feared that he was aiming at imperial power. On May 11, 1835 he defeated an insurgent army on the plains of Guadalupe, and as the blow was fatal to the Republicans he was shortly afterward named dictator. The federal constitution was abolished and the governors of the several states became dependent upon the central power.

Texas, however, having long nourished a revolutionary feeling, now broke out into rebellion. Santa Anna attacked San Antonio in February 1836, stormed the Alamo (q.v.), and massacred its defenders, March 6, and going forward pursued the Texans under Sam Houston (q.v.), by whom, however, April 21, at the Battle of San Jacinto (q.v.) his forces were routed and himself taken prisoner. He secured his release by a treaty recognizing the independence of Texas, which, however, was repudiated by Mexico, that country also suspending his dictatorship.

He was permitted to go to the United States, and after his return to Mexico in 1837 lived in retirement for a year, but offered his services to his country against the French in 1838, and taking command of the troops, repelled the assault on Vera Cruz (December 5) and forced the enemy to retire. In this engagement he lost a leg, a casualty which, however, contributed to restore him to popular favor. He again became a leader of the Centralists, and from October 1841 to June 1844 was virtual dictator under the title of President. The new constitution of June 12, 1843, under which he was formally elected President, increased his dictatorial powers, the exercise of which led to a fresh revolution, resulting in his overthrow. He was taken prisoner in January 1845 and banished. But on the eve of the war with the United States, he was recalled (July 1846), and was first appointed generalissimo by the provisional government and in December was made provisional president. At the opening of 1847 he led an army of 20,000 against the American troops under General Taylor, and fought the battle of Buena Vista, February 22-23, in which he was defeated. On April 18 he was attacked and defeated at Cerro Gordo by General Scott. Immediately after the Battle of Chapultepec the City of Mexico fell and was entered by the Americans (September 14). Santa Anna, escaping

from the city, briefly continued a desultory warfare; but on April 5, 1848, having resigned the presidency, he received permission to retire from the country and sailed for Jamaica, going thence to Venezuela. In 1853 he was recalled and elected President for one year, but after setting up an odious despotism, he proclaimed himself (December 1853) President for life, with the title of Serene Highness and the right of nominating his successor. Revolution followed in March 1854, and when he saw that his cause was lost Santa Anna fled from the capital (Aug. 9, 1855) and found refuge in Cuba, Venezuela, and Saint Thomas. In this absence he was tried and condemned for treason, and his estates were confiscated. He returned to Mexico during the French occupation (1864), but was not permitted to remain. In 1867 he again returned, but was once more exiled and went to live in the United States. Finally, after the death of Juarez and the amnesty of 1874, he was permitted to reside in his own country, where his career ended in poverty and obscurity. See also MEXICAN WAR; MEXICO—*History* (Independent Mexico); TEXAS —*History*.

SANTA BARBARA, săn'tà bär'bà-rà, city, California, and Santa Barbara County seat, altitude 27 feet, located on Santa Barbara Channel, an arm of the Pacific Ocean, protected by the Santa Barbara Channel Islands, 103 miles northwest of Los Angeles. It is served by the Southern Pacific Railroad, by two airlines, and has a fine yacht harbor.

A seaside city and year-round resort, with a rich California agricultural hinterland, it is the trading center for a district comprising parts of three counties. There is light industry in the city, and there are extensive oilfields nearby. The industry existing is of the lighter handcraft variety and chiefly local.

Educational and cultural interests are strongly represented. Elementary schools are about evenly divided between public and parochial. In the former group are two junior high schools, and one senior high, with excellent private schools available. Besides these there are St. Anthony's Academy and a branch of the University of California—Santa Barbara College. The college has a fine library with the William Wyles collection of books and documents relating to Lincoln, the Civil War, and the Reconstruction period. The Faulkner Art Gallery, Museum of Art, Museum of Natural History, the County Bowl—a natural amphitheater used in the annual "Old Spanish Days" Festival and other municipal gatherings—all combine with the Courthouse and many old buildings in linking the city's American present with it colonial Spanish past.

History.—The city's heritage is commemorated in many community celebrations. Santa Barbara Mission is one of the finest examples of mission architecture and historical significance. It was founded in 1786 by the immediate successor to Father Junípero Serra, with the present building dating from 1815. The first white man to visit the city's site was the Spanish navigator Juan Rodríguez Cabrillo in 1542. In 1782, the viceroy of Mexico sent a group of men here to found a presidio or fortified settlement. Yankee trade developed as the years progressed until, in 1846, Commodore Robert Field Stockton claimed the land and flew the American Flag over it. The garrison he left was driven out, but Col. John C. Frémont, United States Army, retook the post and shortly afterward the United States acquired California. In 1887 the railroad reached the city from the south, and in 1901, Santa Barbara was connected by rail with San Francisco, and the modern era began.

Santa Barbara is named in honor of St. Barbara as the Mission was founded on her day, December 4. The settlement was incorporated as a city in 1850. The city's government is of the mayor and council plan. Pop. (1940) 34,958; (1950) 44,193.

SANTA BARBARA, city, Honduras, in the Department of Santa Barbara near the river Ulúa, 45 miles south-southwest of San Pedro Sula. It is a commercial center of an agricultural area raising livestock and growing sugarcane. Its main industry is the manufacture of palm hats. It was founded in 1761 by settlers from Gracias. Pop. (1950) 2,684.

SANTA BARBARA, municipality, Philippines, Province of Iloilo, island of Panay, be-

Santa Barbara Mission.

tween a branch of the Janipaan River on the north and the Tigón River on the south, 12 miles north of Iloilo, the provincial capital. Pop. (1948) 35,406.

There is also a smaller municipality of the same name, Province of Pangasinan, Luzon, 12 miles east of Lingayén; at the crossing of two roads. Pop. (1948) 15,125.

SANTA BARBARA CHANNEL, strait, in the Pacific Ocean, between the northern islands of the Santa Barbara group and the mainland of California.

SANTA BARBARA ISLANDS, a group off the coast of California, lying 20 to 60 miles from the mainland, south and southeast of Santa Barbara city. They are nine in number; San Miguel, Santa Rosa, Santa Cruz, Anacapa, Santa Barbara, Santa Catalina, San Clemente, San Nicolas, and San Juan. From San Miguel on the north to San Clemente is about 155 miles.

SANTA CATALINA, săn'tă kat"l-ē-nă, or **CATALINA,** island, California, one of the Santa Barbara Islands, separated from the mainland by San Pedro Channel and Gulf of Santa Catalina. The island was discovered in 1542 by Juan Rodríguez Cabrillo, a Portuguese explorer in the service of Spain, and was named by him San Salvador. The explorer Sebastian Vizcaino visited the island 60 years later and gave it the present name, in honor of St. Catherine of Sienna. The island is 22 miles long, with an average width of four miles; area, about 55,000 acres. It is hilly and well-wooded and has many deep gorges. Avalon is the only town on the island. The surrounding waters abound with fish. The island is privately owned.

SANTA CATARINA, săn'tă kăt-ă-rē'nă, state, Brazil, bounded on the north by the state of Paraná, on the east by the Atlantic, on the south by the state of Rio Grande do Sul, and on the west by the Argentine territory of Misiones; it includes the fortified island of the same name, and several smaller ones on the coast; area, 28,620 square miles. Florianopolis (pop., 1950, 49,290), is the capital. A series of valleys run west to east, formed by spurs of the boundary mountain range, and the state is watered by the river São Francisco, and numerous streams all falling into the Atlantic. The headwaters of the Uruguay River are in this state. The soil, though in the lower lands sometimes sandy, is fertile, the climate mild, and the seasons regular. Sugar, rice, mandioca, millet, beans, onions of immense size, and garlic are the chief cultivated products, considerable quantities of which are exported to Rio de Janeiro. The indigo and cochineal plants grow luxuriantly, and wheat and flax give good returns.

The state is well wooded, producing excellent timber; and gold, silver, iron, coal, and petroleum exist. The forests are infested by ounces, coatis, monkeys, pigs, and other animals. Birds are numerous, including several varieties of hummingbirds, and the lakes and rivers are frequented by innumerable geese and other waterfowl. Pop. (1950) 1,578,159.

SANTA CLARA, săn'tă klâr'ă, city, California, in Santa Clara County, altitude 83 feet, 45 miles south of San Francisco. It is served by the Southern Pacific Railroad, Southwest Airlines, and bus lines.

The center of a rich agricultural area, it has numerous huge fresh and dried fruit processing industries as well as frozen fruit and vegetable plants. There are also several mills including one of the largest sash and door companies on the coast. Other industries are insulation material, paint, and paper.

Santa Clara was first settled by Fransicans in 1777; it became a town in 1852; and received a new charter in 1867. The old Santa Clara Mission is of great historic interest. A fine boulevard, the Alameda, connects the town with San Jose. Municipal government is administered by a board of five trustees. Pop. (1940) 6,650; (1950) 11,702.

SANTA CLARA, city, Cuba, capital of the Province of Las Villas, on the United Railways, 160 miles east-southeast of Havana. It was founded in 1689. Formerly it was the eastern terminus of the railroad from Havana, but in 1902 the railroad system was extended to the eastern end of the island. It is the center of a fertile agricultural region, is the second largest inland city of Cuba, and has considerable commercial importance, which is increasing with the development of the railroad facilities. Silver has been mined in the vicinity, but not successfully; an excellent quality of asphalt and graphite are obtained and exported; and illuminating gas for lighting the city has been manufactured from this asphalt; petroleum is also reported in the vicinity. The city is well built, the streets are wider than is usual in the older Cuban cities, and municipal sanitation has been improved since 1898. Pop. (1943) 53,981.

SANTA CLARA, University of, an institution for higher learning established at Santa Clara, Calif., on the site of the old Santa Clara Mission in 1851. It was incorporated as a university in 1875, but was known as a college until 1912 when the title university was assumed. Its courses comprise philosophy and letters; general science; civil, mechanical and electrical engineering; architecture; pedagogy; and a premedical course. It is Roman Catholic in denomination. The average enrollment is about 1,200 students.

SANTA CLAUS, săn'tă klôz, corruption of St. Nicholas, the patron saint of children. Under this name he is especially associated with the giving of presents at the Christmas season. See also NICHOLAS, SAINT.

SANTA CRUZ, săn'tă krōōs', 1ST MARQUIS OF (ALVARO DE BAZAN), Spanish admiral: b. Granada, Dec. 12, 1526; d. Lisbon, Feb. 9, 1588. Under Don John of Austria he played a brilliant role at Lepanto (1572) and the next year at the taking of Tunis. His victory off Terceira (1583) completed the Spanish conquest of Portugal. That year he proposed to Philip II the conquest of England. His plan was accepted and he was commissioned to organize and command the requisite fleet. Unjustly reproached by the king for long delays in its preparation, he died at Lisbon a few months before the "Invincible Armada" at length sailed from that port under command of the incompetent duke of Medina Sidonia.

SANTA CRUZ, săn'tă krōōs, **Andrés,** Bo-

livian soldier and politician: b. La Paz, Bolivia, about 1794; d. St. Nazaire, France, 1865. He was of partial Indian descent, entered the Spanish army and rose to the rank of colonel. He was captured by the patriots in 1820, persuaded to adopt their cause, became a general in the army, and led an invasion of Upper Peru in 1823. In 1826–1827 he was acting President of Peru under Bolivar and in 1829 he was elected President of Bolivia for a term of 10 years, receiving also the title of grand marshal. His measures were progressive and the country enjoyed great prosperity under his administration. From the first he adhered to his purpose of uniting the Pacific Coast republics, and his successful invasion of Peru in 1836 was followed by his proclamation of the Peruvian-Bolivian confederation. In 1839 a Chilean army invaded Bolivia and defeated Santa Cruz at Yungay. He resigned and left the country, whereupon the confederation was dissolved. He was afterward engaged in Europe on various diplomatic missions for Bolivia.

SANTA CRUZ, săn'tä krōōz'; Spanish sän'tä krōōs', national territory, Argentina, in southern Patagonia, area 77,843 square miles. It is the southernmost area of continental Argentina between the Deseado River and the Strait of Magellan and bounded by the Andes and the Atlantic Ocean. It is predominately a sheep raising area; some alfalfa, potatoes, and grain are grown. The capital is Río Gallegos.

In 1946 the Comodoro Rivadavia military zone was established by the Argentine government which took part of the territory's northern area. Pop. (1947) 24,582.

SANTA CRUZ, department, Bolivia, bounded on the north by the Department of Beni, and the Brazilian Province of Mato Grosso; on the east by the river Paraguay and the Brazilian territory; on the south by the desert of Gran Chaco (Chaco) and Chuquisaca Department; on the west by the Department of Cochabamba; area 142,105 square miles. It is mostly level, except in the western part where it reaches the Andes. It is drained by the Rio Mamoré and the Rio Beni, and their tributaries. The central region is heavily wooded, with some open marshes and plains. It is thinly populated, most of the towns being in the western part and along the rivers. The soil between the mountains and the central forests is fertile, and yields sugar, coffee, cacao, and rice. Some cotton is manufactured and gold is mined in the mountain district. Pop. (1949 est.) 409,800.

SANTA CRUZ, city, Bolivia, capital of the Department of Santa Cruz, on the Piray River, on the eastern slopes of the Andes. It is in a fertile agricultural region producing sugar, coffee, and petroleum.

It is an important trade center for the agricultural products produced in the area (sugarcane, rice, coffee, and tobacco). The city was founded in 1560. Pop. (1949 est.) 36,400.

SANTA CRUZ, city, California, and Santa Cruz County seat, altitude 15 feet; on Monterey Bay; on the Southern Pacific Railroad; by rail, 81 miles south of San Francisco. In the surrounding area are farms and nurseries, orchards and vineyards; the Santa Cruz mountains are timbered, and the handling of lumber is one of the city's major industries. In and about Santa Cruz cement, leather, fishing, and bulb-growing furnish fields for enterprise; and resort business is an important item. Besides the public and parochial schools, with one senior and two junior high schools, there are many churches and several hospitals, including one county institution; a public library and a museum. Together with the usual civic, social, and service clubs, the city has an art league and a music club. There is a municipal pier as well as a municipal recreation ground. The Mission of Santa Cruz (the Holy Cross) was founded in 1791; it was secularized in 1834. Whaling ships used frequently to put in here to buy green food for the crews, in order to check the ravages of scurvy. By 1840, with trade in redwood lumber, Santa Cruz began to prosper. It received a city charter in 1866. Its government is of the commission form. Pop. (1940) 16,896; (1950) 21,970.

SANTA CRUZ, the name of several municipalities, Philippine Islands: (1) capital of the Province of Laguna, Luzon, on the southeast shore of Laguna de Bay, at the mouth of the Santa Cruz River, 34 miles southeast of Manila. It is connected by highway, railroad, and boat with Manila and is an important trading center for rice and sugar. It was made the capital of the province in 1858. Pop. (1948) 17,649.

(2) municipality, Province of Marinduque, on the northeast coast, 18 miles east of Boac. The town lies about a mile and a half from the shore, and three miles from the anchorage ground. It is a port of entry for coasting vessels, and the anchorage is well protected. It is surrounded by a fertile agricultural country. Pop. (1948) 24,537.

(3) municipality, Province of Zimbales, Luzon, on the coast, 30 miles north of Iba. Pop. (1948) 11,194.

(4) municipality, Ilocos Sur Province, Luzon, on coast highway, 34 miles south of Vigan. Pop. (1948) 12,948.

(5) municipality, Davao Province, Mindanao, 21 miles southwest of the city of Davao, on the Gulf of Davao. It has an excellent harbor. Pop. (1948) 33,808.

SANTA CRUZ, river, Argentina, about 250 miles long. It flows east out of Lake Argentino in the western part of Santa Cruz territory and empties into the Atlantic Ocean at Santa Cruz.

SANTA CRUZ, river, Arizona and Mexico. It rises in the Patagonia and Huachuca mountains in southern Arizona, and flows south into Sonora, northwest Mexico, turns north to Tucson and then northwest and flows into the Gila River. It is used for irrigation in Pima County, Arizona.

SANTA CRUZ DE TENERIFE, krōōth ~~th~~a tā-nâ-rē'fâ, city, Canary Islands, capital and commercial port of the Canary Islands (Province of Santa Cruz de Tenerife), on the northeast coast of the island of Tenerife. Many of the houses are handsome, and of one and two stories high; but the majority are low. The streets are well paved, and lighted by electricity. There is a square, surrounded by wooden edifices, and adorned with a colossal statuary group representing the apparition of the Virgin of Candelaria to the Guanches, the original inhabitants. Besides

the custom house and the military hospital, there are scarcely any public buildings; the church of San Francisco is the finest. The harbor, which is very secure, has a magnificent mole, of modern construction; other works, including a breakwater, have recently been constructed. Tomatoes, bananas, potatoes, wine, brandy and cochineal are the chief articles exported; and the imports consist largely of manufactures, with coal, grain, and flour. Pop. (1941 est.) 73,299.

SANTA CRUZ ISLANDS, island group, in South Pacific Ocean, administratively attached to the British protectorate of the Solomon Islands. They are north of the New Hebrides and 240 miles off the southern part of the Solomon Islands. The group comprises about a dozen small islands with a combined area of 380 square miles. The larger islands are volcanic and mountainous. Most of them are surrounded by coral formation. The climate is hot, humid and unhealthful but the soil is very fertile and the vegetation luxuriant. The largest island is Ndeni.

The inhabitants are chiefly Polynesians who are supported partly by their plantations of coco palms, partly by fisheries, and by trading with neighboring islands.

The archipelago was discovered in 1595 by Mendana. In World War II it was the scene of a naval engagement, Oct. 26, 1942, in which American vessels and carrier planes defeated the Japanese but suffered loss of the *Hornet*. Pop. (1931) 5,080.

SANTA FE, fā, or **SANTA FE DE LA CRUZ,** Argentina, capital of the province of the same name, near the junction of the Salado with the Paraná, 299 miles by rail northwest of Buenos Aires. It stands on an eminence which is prominent in a district otherwise level. The Cabildo, the most important building, stands on the plaza or main square. Santa Fé is the seat of the governor, legislature, and the bishop. There are several churches and monasteries, also a normal school for teachers. Hides and timber form the chief articles of trade. The principal industries are cloth, choel, soap, quebracho-wood factories; flour mills, tanneries, chemical plants. Pop. (1943 est.) 149,926.

The province of Santa Fé covers 52,056 square miles, and has a rapidly increasing population. Rosario (q.v.) is the largest city. There are vast numbers of cattle, sheep and horses on extensive farms, and many acres of land are planted in cereals. Pop. (1943 est.) 1,613,586.

SANTA FE, săn'tà fā', city, New Mexico, capital of the state and seat of Santa Fe County, is located at an altitude of about 7,000 feet in the northern Rio Grande Valley in north central New Mexico. Through the city flows the Santa Fe River, a tributary of the Rio Grande. Santa Fe's 30 square miles are surrounded by snow-capped mountains—the Ortiz, the Sandia, the Jémez, and the Sangre de Cristo at the foot of which the city nestles. Santa Fe lies 62 miles northeast of Albuquerque, 35 miles southeast of Los Alamos, and 66 miles west of Las Vegas, by highway. No railroad serves the city directly; but the main line of the Atchison, Topeka and Santa Fe passes through Lamy, 18 miles south of it, and there is direct connecting motor-bus extension service to Santa Fe. The city has its own municipal airport with scheduled airline service. Santa Fe is a shipping center for piñon nuts, and for the products of local handicrafts almost all of which are produced in shops employing less than a half dozen people each. It is not an industrial city. It is important, however, not only as a political center but also as a center for archaeologists and other scientists, and it is a paradise for tourists who flock to it from all parts of the country.

Santa Fe is the second youngest of the state capitals, yet it is the oldest seat of government within the national boundaries. Above it, at different times, have flown the flags of Spain, Mexico, the Confederacy, and the United States.

History.—During the winter of 1609–1610, Pedro de Peralta, the third Spanish governor of the Province of New Mexico, founded Santa Fe as his capital. He named it *La Villa Real de la Santa Fé de San Francisco de Asis,* or The Royal City of the Holy Faith of St. Francis of Assisi, shortened through the years to Santa Fe. Here he built his palace-fortress, laid out a public square, and walled it with adobe. A pack train service, called the Mission Supply, was started at once between Mexico City and Santa Fe to provide settlers and missionaries in the province every three years with materials they could not obtain on the frontier. By 1617, there were 11 mission churches in the province, which stretched from the Mississippi to the Pacific and an indefinite distance northward, but there were only 48 Spanish soldiers and settlers. Although the Mission Supply continued to arrive regularly, it brought few colonists with it, and growth was slow. Friction between the civil and ecclesiastical authorities was a handicap almost from the beginning, and Indians were exploited by both groups. Trouble with the Indians developed, and in 1680 a plot was discovered to drive out—or wipe out—the settlers and destroy Santa Fe. The discovery did not save all the Spaniards, but settlers near Santa Fe managed to reach it before the Indians laid siege. Several days later, the Spaniards executed a surprise attack. After killing some of the Indians and putting the rest to rout, Santa Fe was abandoned. The Indians took it over, burning churches and destroying records. (Most of the later records of Spanish rule were also lost in the 1800's.) The Indians held Santa Fe until 1692 when 300 Spaniards, led by Gov. Diego de Vargas, retook it practically without opposition, and subdued other Indians in the province. (Since 1712, the reconquest has been celebrated annually in Santa Fe by a three-day *fiesta* during which the formalities of the event are re-enacted before the Palace of the Governors.) Vargas returned to Mexico and in 1693 brought back from Santa Fe soldiers, missionaries, and 70 families of settlers.

Beginning in 1739, French colonial traders began to find their way to the city; and in 1792 the first round trip was made over the route which later became the famous Santa Fe Trail, connecting New Mexico's capital with the northern cities of the United States. Mining operations had been carried on in the hills around Santa Fe since its early days, and Mexico had hardly secured its independence from Spain when traders from the United States arrived and regular trade was established. They brought American manufactures and exchanged them for gold, silver, and furs. In 1834, a Spanish-

language newspaper made its appearance, the first within the present bounds of the state; and the treaty which ceded New Mexico to the United States was not even signed before an English-language newspaper was published. In 1849 a stage line carrying mail and passengers was opened, giving the city regular connections with Independence, Mo., and increasing the number of *anglos* in the territorial capital. After the Roman Catholic Vicarite Apostolic of Santa Fe was established in 1850, parochial education was expanded, and English-language schools were opened. The year 1851 saw Santa Fe the official capital of the territory, and a national bank was organized there in 1870. Like the famous Pony Express, a similar one instituted in 1861 between Santa Fe and Denver was short-lived; but wagons carried mail, passengers, and freight over the route until 1880, when a spur of the railroad reached the city. By this time, its population had grown to 6,635 and, although many *anglos* resided there, the city was predominantly Spanish in culture, and its homes and almost all other buildings were of adobe in the Spanish-pueblo style. In the next 30 years population declined somewhat but more buildings in "foreign" styles were erected. Santa Fe continued as the capital when New Mexico was admitted as a state in 1912; and, with its status now assured and state activities expanding, population increased. It was about this time that artists from other parts of the country began to establish homes in and around Santa Fe. They liked this city with its Spanish atmosphere and its narrow, winding streets; but businessmen wanted to modernize it. The city was divided over the issue; but the idea of preserving its unique qualities prevailed, and the increasing amount of wealth that has been brought into Santa Fe by new residents and tourists who enjoy its cultural atmosphere and climate have justified the decision.

Government.—The city government is of the mayor-council type, with the mayor directly elected by the people and eight councilmen elected by their wards. By common, unwritten consent, the mayor and half of the councilmen are of Spanish-American background. The city not only owns and operates the airport, but also the sewage treatment plant of the city.

Educational and Religious Facilities.—In addition to the public school system and Catholic parochial schools, the educational institutions in the city include the Allison-James School (Presbyterian, for Spanish-speaking youth), St. Michael's College (Catholic, for men), the Seminary of the Immaculate Heart of Mary (Catholic, preparatory), the New Mexico School for the Deaf, a United States Indian school, and the Hill and Canyon School of the Arts. Santa Fe has 11 Protestant and 4 Catholic churches, and is the seat of a Catholic archdiocese.

Cultural Facilities and Points of Interest.—For music and dramatics, there are such organizations as the Community Concert Association, the Sinfonietta and Chorale Society, and a Little Theater, as well as a professional theater in summer. The Catholic cathedral contains a museum of ecclesiastical art. The Museum of Navajo Ceremonial Art, a privately owned institution housed in a modern interpretation of a Navajo ceremonial lodge, is reputed to contain the most important collection of reproductions of Navajo sand paintings in the world. The Art Gallery of the Museum of New Mexico, a modern structure faithful in style to the old Spanish-pueblo architecture, displays a fine permanent collection of Southwestern art and presents a special exhibition during the *fiesta* each year. Another building of the Museum of New Mexico is the old Palace of the Governors, which houses the School of American Research (a nonprofit corporation devoted to the study of man on the American continents), and the Historical Society of New Mexico, and it exhibits a wealth of archaeological and historical materials of the Southwest. In this long, low, walled building, Gen. Lewis Wallace resided when he was New Mexico's territorial governor, and here he wrote the final chapters of his famous novel, *Ben Hur*. Although the palace has gone through many renovations and at least one major restoration, it has stood on its present site since Peralta built it. Other buildings of the Museum of New Mexico are the Hall of Ethnology, the Laboratory of Anthropology, and the Museum of International Folk Art.

South of the palace is the Plaza, or public square, dating from Paralta's time but now much altered. In the Plaza, with its lawns, shade trees, walks, and bandstand are markers indicating where the Santa Fe Trail ended and where the proclamation was read which stated that New Mexico had been annexed to the United States. Among the Catholic churches and missions of the city are some that date dack to the 1600's and contain valuable paintings and other works of art. The Cathedral of San Francisco de Asis, built (1869–1886) of local sandstone in French Romanesque style, was erected around a parish church known as the Parroquia, which is believed to have been built on the site of a still earlier church erected 1622–1627.

Population.—The population of Santa Fe is about evenly divided between people of Spanish and non-Spanish background. Numbers of Indians may be seen within the city, but most of them live in nearby Indian villages and come to Santa Fe to work or sell their wares. Pop. (1950) 27,998.

SANTA FE TRAIL, The, an historically famous overland trade route over which originally merchandise, and later both passengers and merchandise, were transported from points in Missouri to Santa Fe, New Mexico, in wagons, which, on the return trip, brought back furs, silver and other products of the Southwest. Before the opening of the trail, merchandise was carried to Santa Fe on the backs of mules from far away points in Mexico, inasmuch as the Spaniards summarily prohibited trade with the United States. Mexico gained its independence in 1821, and in 1822 William Becknell, who in the previous year had freighted goods by pack horses from Missouri to New Mexico, arrived in Santa Fe from Franklin, Mo., with 21 men and three wagonloads of goods which he sold at a tremendous profit. He thus came to be known as "the father of the Santa Fe Trail," which others soon followed. Becknell followed the divide between the tributaries of the Kansas and the Arkansas rivers to the great bend of the Arkansas, then followed the Arkansas almost to the mountains before turning south to Santa Fe. This became the Santa Fe Trail of history, though later a shorter route through the Cimarron Valley was opened. The Trail passed into disuse with the coming of the railroads in 1880.

SANTA MARIA, săn'tà mà-rē'à, city, California, in Santa Barbara County, 74 miles northwest of Santa Barbara; altitude 231 feet above sea level. Transportation is supplied by bus lines and regularly scheduled flights both northbound and southbound by Southwest Airways. It is served, so far as freight is concerned, by one of the country's few privately owned railroads—the Santa Maria Valley Railroad, which connects with the main line of the Southern Pacific Railway about ten miles to the west.

Agricultural activities in the Santa Maria Valley are extensive and widely diversified. One of the chief products is flower seeds. About half of the world's flower seeds are packaged for sale here. Dairying and cattle ranching are also important economic activities. Since its discovery in 1902 oil has also played an important part in the economy of the Santa valley. New fields are constantly being explored and opened.

In addition to excellent city schools, there is a junior college and the University of Southern California College of Aeronautics is located in Santa Maria at Hancock Field. There are two daily newspapers and one weekly, and three radio stations.

History.—First settled by white people in 1840, the town was platted and organized as a village in 1874, under the name of Central City. In 1882 the post office changed the name to Santa Maria and incorporation as a city was effected. The government is by mayor and council. Pop. (1950) 10,440.

SANTA MARIA, săn'tà mä-rē'ä, municipality, Philippine Islands, in Bulacan Province, Luzon, 10 miles east of Malolos, 15 miles north of Manila. It is the center of a rich rice and fruit region. It has good roads and is near the Manila Dagupan Railroad. There are also facilities for water transportation.

The area suffered great damage during the Philippine insurrection of 1899, as it was the military center of the insurrectionists, and was burned by American troops. Pop. (1948) 17,509.

SANTA MARTA, săn'tä mär'tà, seaport, Colombia, capital of the Department of Magdalena, situated on the north coast near the mouth of the Magdalena River. It is a rich banana producing area. Founded in 1525, it was important in the Spanish era. Pop. (1944 est.) 25,113.

SANTA MAURA, săn'tä mou'rä, or **LEUKAS,** Greece (ancient LEUCADIA), an island of the Ionian group off the western coast, from which it is separated by a strait which was rendered navigable in 1903 by a canal cut through the sandbanks which block the shallow channel. It covers an area of about 180 square miles, is mountainous, the ranges running north and south and terminating in the white cliffs from which the island derives its name.

SANTA MONICA, săn'tà mŏn'ĭ-kà, city, California, in Los Angeles County, altitude from sea level to 300 feet; on Santa Monica Bay, an arm of the Pacific Ocean. It is served by the Pacific Electric Railway, by federal and state highways, and has a municipal airport. Located here are offices for transcontinental airlines, railways, and buses. Eight miles distant is the Los Angeles airport. Santa Monica is a busy trading center for the surrounding area. It has smart shopping districts, attractive homes, modern hotels, fine beaches, and excellent recreational facilities.

The 175 manufacturing plants are engaged in light industries which include the making of aircraft, machine tools, dies, toys, boats, fishing tackle, leather goods, ceramics, television, footwear, furniture, cosmetics, woodworking, and sportswear.

There is a fine public library with two branches, nine elementary schools, two junior high schools, a senior high school, three parochial schools, and five private schools. The University of California (UCLA) is two miles east of city limits and Loyola University is four miles south of the city. There are three newspapers—one daily and two weekly. There are extensive cultural activities—the Santa Monica Symphony Orchestra is well known.

History.—Legend ascribes the name of Santa Monica to Gaspar de Portola's Spanish scouts. One soldier watching a small waterfall drop into the shadow compared the sparkling waters to the tears of St. Monica, shed for her wayward son, Augustine. The city was founded in 1875 and incorporated in 1886. It has council-manager government. Pop. (1940) 53,500; (1950) 71,595.

SANTA ROSA, săn'tà rō'zà, city, California, and Sonoma County seat, altitude 150 feet; on Santa Rosa Creek; on the Northwestern Pacific motor stage lines, and the Petaluma and Santa Rosa Electric Railroad; by rail, 54 miles north of San Francisco. It is in a rich agricultural region, producing fruits, grains, and vegetables. In addition to its stock-raising and dairy-farming interests, Santa Rosa has varied industries, the leading ones are: the making of shoes, macaroni, and chemical products; it also has tanning and egg-packing plants, and planing mills.

In addition to the public and parochial schools, Santa Rosa has a junior college, a college of commerce, and the Ursuline College for girls.

Points of interest are the home and gardens of the late Luther Burbank, scientist and breeder of plants; a church built from a single redwood tree; an old fort, kept up as a relic of the Russian occupation; a petrified forest; geysers; wineries, and the Redwoods State Park, with its forest theater. Pop. (1940) 12,605; (1950) 17,902.

SANTA TECLA, săn'tà tā'klä, a picturesque town in Salvador. See NUEVA SAN SALVADOR.

SANTAL PARGANAS, sŭn'täl pŭr'gà-näz, district, Indian Union, Bhagalpur division, eastern Bihar Province, bounded on the north and partly on the east by the Ganges; area, 5,480 square miles (1941). The district is named from the Santáls, who form the most characteristic portion of its inhabitants, and are also found elsewhere in India. They are one of the aboriginal races belonging to the Dravidian stock, are dark-colored, and mostly profess a religion of their own, in which the worship of a chief deity and subordinate deities and a sort of ancestor worship play a chief part. They live chiefly by hunting, and are exceedingly fond of flute-playing, dancing and singing. The Church Missionary Society and the Scandinavian Home Mission have succeeded in improving their condition and promoting education among them. The district is

crossed by lines of the East India Railway. It contains the old Mohammedan city of Rajmahal on the Ganges and also Deogarh, the Hindu place of pilgrimage. The capital is Dumka. Pop. (1941) 10,811; of district, (1941) 2,234,497.

SANTALS, or SANTHALS. See SANTAL PARGANAS.

SANTANA, sän-tä'nä, **Pedro,** West Indian soldier and politician: b. Hineha, Santo Domingo, June 29, 1801; d. there, June 14, 1864. A lawyer and wealthy landowner, he joined the revolt against Haiti in 1844, soon rising to command of the insurgent army. He was elected president of the "independent State of Spanish Haiti" in November 1844 for a four-year term. After his term ended he was recalled (1849) to repel Haitian aggression. Re-elected to the presidency in 1853 he served until 1857, repelling two more Haitian attacks in the interim. He seized the government in 1858, but despairing of maintaining order, agreed to the country's annexation to Spain in 1861.

SANTANDER, sän-tän-dār', **Francisco de Paula,** Colombian soldier and statesman: b. Rosario de Cúcuta, New Granada, April 12, 1792; d. Bogotá, May 5, 1840. For his services in the war of liberation he was promoted general of division (1817) and especially distinguished himself in the victory of Simon Bolívar at the Battle of Boyacá (Aug. 7, 1819). When the Constitution of Colombia was adopted in 1821 he was inaugurated vice president, Bolívar being president. Re-elected in 1827, he led the opposition to Bolívar, was deposed by the latter (1828) and sentenced to death, but was reprieved and exiled. After serving as president of New Granada (1832–1837), he ended his life as a member of Congress.

SANTANDER, department, Colombia, situated in the north central part of the country, between Venezuela and the Magdalena River. Area, 12,382 square miles. Its capital is Bucaramanga. The greater part is occupied by the Eastern Cordillera of the Colombian Andes, which runs lengthwise through the department. The range is cut near the middle by the deep valley of the Sogamoso River. Only the uplands are inhabited; the lowland along the Magdalena is an unhealthful and densely forested wilderness. The chief products are sugar, coffee, cacao, tobacco, cotton, rice and wheat. The mountains, however, are rich in minerals, including gold, silver, iron, copper and coal. Pop. (1950 est.) 756,420.

SANTANDER, Spain, (1) capital of a province of that name, and one of the chief ports of the Peninsula, 207 miles by rail north of Madrid, near the Bay of Biscay. The principal modern buildings are the town-hall, theatre, market, barracks, bull-ring, clubs, civil and military governor's residences, the institute and other schools, custom-house and hospitals. There are numerous open squares and magnificent promenades, notably that of "Paseo del Sardinera," which leads to the bathing establishment. The higher and lower town are direct antipodes in point of architecture and general construction. The cathedral, of Gothic type, has a fine crypt containing a Moorish font. The chief features of the city are its quays and factories. There are shipyards, paper-works, foundries, extensive breweries, sugar refineries, manufactories of sails, hats, candles, vermicelli, phosphorus, sulphuric acid, fish-curing establishments, etc. The principal export is iron ore, in normal years, chiefly sent to Great Britain and Germany. Other exports are wine, flour, provisions, etc. Santander was probably the ancient Roman *Portus Blendium.* The town was sacked by the French under Nicolas Jean de Dieu Soult in 1808. Pop. (1940) 84,971.

(2) The Province of Santander, on the north coast of Spain, covers an area of 2,044 square miles. It is enclosed on all sides but the north with lofty summits and traversed by railroads of various kinds. It possesses extensive forests and important mines of iron and lead; it also produces large quantities of grain. The industries of mining, sylviculture and agriculture are steadily improving. Livestock is abundant and valuable, especially in the highlands. Pop. (1940) 393,044.

SANTAYANA, sän-tä-yä'nä, **George,** Spanish poet and philosopher: b. Madrid, Dec. 16, 1863; d. Rome, Sept. 26, 1952. Brought by his father to Boston in 1872, he acquired his lifelong love of English poetry at the Boston Latin School. Graduating at Harvard in 1886, he obtained his master's degree and doctorate in Germany, then joined the Harvard faculty in 1889 as an instructor in philosophy, becoming full professor in 1907. Like his contemporary Charles T. Copeland, he preferred the companionship of his students to that of faculty colleagues, and the students reciprocated with unbounded admiration for his lucid intelligence, detached skeptical views, and mordant wit. Through these associations he acquired his understanding of the Puritan mentality of Boston and Cambridge society, delineated a quarter of a century later in *The Last Puritan* (1936), "a memoir in the form of a novel." Retiring from his professorship in 1912, he lived at Oxford until the end of World War I, then removed to Rome where he remained until his death.

With Josiah Royce and William James he ranks among the great Harvard philosophers of the end of the 19th and early 20th centuries. Though born a Catholic and loving the beauties of Catholicism, he was not a believer; yet his *Idea of Christ in the Gospels* (1946) was described by a reviewer as "the most devout book ever written by an unbeliever." In it he attempted to justify religious myth on intellectual grounds. Among the poetic works which established his reputation before he left the United States are *Sonnets and Other Poems, Lucifer—A Theological Tragedy,* and *The Sense of Beauty.* In 1940 he published a new edition of his *Egotism in German Philosophy,* emphasizing earlier criticisms of the Nazi philosophy. Columbia University awarded him in 1945 the Nicholas Murray Butler gold medal, given for the most distinguished contribution to philosophy, or educational theory, practice or administration made anywhere in the world during the prior five years. Two volumes of his autobiography, *Persons and Places,* were published in 1944 and 1945; the third and last was completed but not published at the time of his death.

SANTEE RIVER, S. C. See WATEREE RIVER.

SANTERRE, sän-târ′, **Antoine Joseph,** French revolutionary politician and general: b. Paris, March 16, 1752; d. there, Feb. 6, 1809. In 1789 he took part in the storming of the Bastille, and in 1792 he led the Parisian Garde Nationale in the attack on the Tuileries. With the rank of field marshal, he guarded the royal family until their execution. After his forces were defeated by the Vendeans in 1793 he was arrested an an Orleanist; he did not gain his release until the fall of Robespierre. Thereafter he lived in retirement.

SANTIAGO, sän-tyä′gō, or **SANTIAGO DE CHILE,** city, Chile, capital of the republic and of Santiago Province, on the Mapocho River 116 miles east-southeast of Valparaiso. It stands on a plain 1,706 feet above sea level, westward of snow-clad Andean peaks. The city is the seat of an archiepiscopal see; the cathedral was destroyed in an earthquake in 1647 and was rebuilt in 1748. Notable buildings include the presidential palace, the capitol, the national museum, the national library (containing 500,000 volumes), and the national conservatory of music. The University of San Felipe was founded in 1747 and closed in 1839; in 1842 it was refounded as the University of Chile. The fourth largest city of South America, it has varied manufactures. Pedro de Valdivia, the Spanish conqueror of Chile, founded the city in 1541. It figured prominently in the wars of liberation and became the capital of a free Chile after the Battle of Maipo, April 5, 1818. Earthquakes and other natural disasters have visited the city on several occasions. Pop. (1948 est.) 1,144,000.

SANTIAGO ATITLAN, sän-tyä′gō ä-tē-tlän′, or **ATITLAN,** town, Guatemala, in Solala Department, situated on the south shore of Lake Atitlan. Medicinal springs are found in the neighborhood. Pop. (1940) 6,742.

SANTIAGO DE COMPOSTELLA, sän-tyä′gō*th*ä kôm-pōs-tā′lä, town, Spain, in La Coruña Province 32 miles southwest of La Coruña. The cathedral, erected during 1082–1128, is said to have been built on the site of the grave of the apostle Saint James and to contain his bones; long and most frequented place of pilgrimage in western Europe, the city acquired the popular designation of the "Mecca of Spain." A hospice for pilgrims was founded in 1504 by Ferdinand and Isabella, and the university dates from 1532. The great Benedictine convent of Saint Martin has been converted into barracks. Formerly the city was the capital of Galicia. There are mineral springs in the vicinity. Manufactures include linen, silverware, spirits, chocolates, and paper. Pop. (1949) 56,740.

SANTIAGO DE CUBA, sän-tyä′gō *th*ä kōō′vä, seaport, Cuba, capital of Oriente (formerly Santiago de Cuba) Province, on a landlocked bay on the south coast, 540 miles east-southeast of Havana (La Habana). The bay, 6 miles long and 3 miles in width, is connected with the Caribbean by a long, winding channel. Mines of copper, iron, and manganese are worked in the vicinity. The city was founded in 1514 by Diego Velásquez (Velázquez), conqueror of Cuba, who was buried in the cathedral. From 1522 until 1589 it was the capital of the island. French invaders plundered the seaport in 1553, and British in 1662. Military operations were conducted in the vicinity during the Spanish American War; outside the harbor, on July 3, 1898, the Spanish fleet was destroyed, and on July 17 the city was surrendered to United States forces. Pop. (1943) 118,266.

SANTIAGO DE LOS CABALLEROS, sän-tyä′gō *th*ā lôs kä-vä-yā′rōs, city, Dominican Republic, capital of Santiago Province, 80 miles northwest of Ciudad Trujillo (Santo Domingo). It is in a fertile agricultural area producing cacao, coffee, and tobacco. Pop. (1948 est.) 62,527.

SANTIAGO DEL ESTERO, sän-tyä′gō *th*ĕl ās-tā′rō, city, Argentina, capital of Santiago del Estero Province (52,222 square miles), on the Dulce River about 88 miles southeast of Tucuman. The city, founded in 1553, contains an interesting church and Franciscan convent dating from about 1590. Pop. province (1947) 574,383; city (1944) 76,445.

SANTILLANA, sän-tē-lyä′nä, **Iñigo Lopez de Mendoza,** MARQUES DE, Spanish poet: b. Carreon de los Condes, Aug. 19, 1398; d. Guadalajara, March 25, 1458. He was a powerful figure at the court of John II of Castile. Commencing as an imitator of the early troubadors, he composed numerous *serranillas* (mountain songs) notable for their simplicity, naturalness of tone, and poetic beauty of form and expression. He was less successful in gaining popularity for his didactic poetry and his imitation of the Italian poets, especially Dante. Nevertheless, such didactic poems as *Dialogo de Bias contra fortuna* and *El Centiloquio* are particularly graceful, beautiful in form, and vigorous in style. He introduced into Spain the Italian form of the sonnet, and produced excellent imitations of Petrarch; and he was one of the first Spanish writers to dig into the mine of literary wealth of Giovanni Boccaccio. His Vaqueira pastorals included *Proverbios de gloriosa doctrina e fructuosa ensenanza* and *Comedieta de Ponza.*

SANTO DOMINGO, săn′tō dō-mĭng′gō, the early name of the island of Hispaniola (q.v.), and former name of the Dominican Republic (q.v.) and of its capital, now known as Ciudad Trujillo.

SANTO TOMAS, sän′tō tō-mäs′, town, Philippine Islands, on Luzon, in Batangas Province northeast of Lake Taal (Bombon), 10 miles south of Laguna de Bay. It is at the western base of Mount Maquiling. Pop. (1939) 16,544.

SANTO TOMAS, Mount, a mountain of Philippine Islands, on Luzon, south of Baguio, in the southern part of Benguet subprovince of Mountain Province. The western side of the mountain, 7,406 feet in height, slopes rapidly to the coast.

SANTONIN, săn′tō-nĭn, a proximate principle ($C_{15}H_{18}O_3$), the active principle of santonica, possessing acid properties; it is obtained from wormseed, the seed of a species of southernwood. It is colorless, crystallizable, and soluble in alcohol, and in the fixed and volatile oils; it is bitter, and is one of the most efficacious vermifuges for roundworms. Its administration

produces changes in the urine and also affects the vision for a few hours; but no ill results follow.

SANTORIN, sän-tō-rēn′, **THERA,** or **CALLISTE,** Greece, the largest of one of the island groups in the Ægean Archipelago, 60 miles north of Crete. It has an area of 27 square miles. The eastern slope is covered with vineyards; the western shores are precipitous, with deep ravines and volcanic indications. The town occupies the lofty heights overlooking precipices. The wines of the island are the chief staple and are called *vino-brusco* and *vino-santo.* Various eruptions have occurred in the vicinity which from time to time have changed the surrounding topography. There are practically no trees and the water supply often fails, it becoming necessary to procure fresh water from neighboring islands. There are many ancient remains, and excavations have brought to light numerous inscriptions of the Mycene and early periods. Pop. 20,000. Consult von Gaertringen, Hiller et alia, 'Thera, Untersuchungen, Vermessungen und Ausgrabungen in den Jahren 1895–98' (Vols. I–IV, Berlin 1899–1902); and 'Inscriptiones Græcæ Insularum Maris Ægæi' (Vol. II, ib., 1898).

SANTOS, sän'toos, Brazil, city in the state of São Paulo, on the Atlantic Coast, 200 miles southwest of Rio de Janeiro and 45 miles from the city of São Paulo. The immense export and import trade of the interior region which it serves has made it one of Brazil's two leading ports. The city lies about five miles up a winding tidal river along which, on the west bank, are built the docks, comprising three to four miles of quays, backed by over two score warehouses. The quays have facilities for docking more than 30 large steamers. The system of warehouses is linked to the São Paulo Railway terminal by a light railway. Santos has outstripped Rio de Janeiro in its exports by reason of its enormous coffee shipments. It is the largest coffee port in the world and is the outlet for the vast coffee production of São Paulo province. The annual exportation is about 9,000,000 bags, or 540,000 tons per year, with a value of over $260,000,000. Although coffee is the chief article of export, Santos has also a large export trade in hides, cacao, tobacco, frozen meat, bananas, and other commodities. Situated on an island, Santos is protected from the ocean by a larger island, with a channel six miles long between the two. A sea wall three miles long has been constructed on the side of the city. This made possible the reclaiming of much pestilential and malaria-breeding swamp-land, from which the health of the city has been greatly benefited. Yellow fever is no longer endemic. The city is well built, has many fine streets and boulevards. Churches crown the heights of Monserrate. There are several monasteries, a city hall, custom house, two hospitals, an arsenal, banks, electric-lighting plants, electric street railways, gas and modern water supply system. A fine monument commemorates the brothers Andrade, heroes of the revolution of 1822. A railway connects the city with São Paulo and the interior. The population is given as about 80,000. Consult 'Encyclopedia of Latin America' (New York); 'Commercial Travelers' Guide to Latin America' (Department of Commerce, Washington); James, H. G., 'Brazil After a Century of Independence' (1925).

SANTOS, sän'tzŏz, **Francisco,** Spanish writer: b. in the first half of the 17th century in Madrid; d. about 1700. He published, between 1663 and 1697, 16 volumes, principally of short stories, intended, as the author professes, for popular amusement. 'Dia y noche en Madrid,' the first of this series, contains many excellent and startlingly graphical pictures of life in the capital of Spain. 'Perequillo, el de las guallineras' (Madrid 1668), a story written in opposition to the picaresque novels still extensively read in his day, was also popular and is still read in Spain. 'Verdad en el potro y el Cid resuscitado' (Madrid 1679) is of interest on account of the songs and popular ballads it contains, many of which date back to an early period of Spanish literature, and some of which differ from all other known versions. Among his other popular stories are 'El diablo anda suelto' (Madrid 1677); 'El vivo y el defunto' (Madrid 1692); 'Tarascas de Madrid y tribunal espantoso' (Valencia 1694); and 'Los Gigantones de Madrid.' Few of Santos' stories now appear in their original form because the literary taste of the Spanish people has changed since his day; but they have been recast by other authors and the ideas contained in many of them have been made use of by some of his successors in the literary field. Consult any good history of Spanish literature.

SANTOS CHOCANO, zho'kän-ō, **José,** Peruvian poet: b. 1875. Since the death of Rubén Darío (q.v.) in 1916, Santos Chocano has been the undisputed leader of Latin American literature; and even before the disappearance of the latter from the scene, Santos Chocano had become a figure at least equal in importance with him on the literary horizon. He influenced Darío strongly and for the better, by enlarging his view and making him, in his latter years, more cosmopolitan. It was through Santos Chocano that Darío was led to see the United States and the American people with other and more favorable eyes. Endowed with a broad vision, he threw behind him, early in his career, all sectionalism and local views, which had hampered most of the preceding Latin American poets and prose writers, and announced himself the apostle of cosmopolitanism and Pan-Americanism. At a time when other younger poets like Rubino Blanco Fombona of Venezuela made it their special business to vilify the United States and all things American and to hold her people up to ridicule as uncouth, uncultured, rude dollar-grabbers, overbearing and unbearable, Santos Chocano proclaimed himself the singer of America in all its varying moods and phases, past and present. He sang, 'My lyre has a soul, my song an ideal.' The sound of his lyre was America; the ideal of his song the unity and harmony of all things American. In his 'El Canto del Porvenir' (Song of the Future) he sees the spiritual union of the North and the South, of the Latin and the Saxon. He believes the one is necessary to the other, and that they have been placed together in the Western world for a purpose. Santos Chocano has the truest vision of all the Latin American writers; and his influence, which has

become very widely extended, has been generally exercised for good. His 'Alma America,' in which he emphasizes the idea of race unity on the Western continent, is a stirring poem which became immensely popular and exercised a strong influence on the younger poets of Latin America. Santos Chocano has become, in a sense, the leader of a new school of poetical thought, whose self-imposed task is to sing the beauties and glories of America. Though united through this ideal, the members of this school use widely different literary methods to attain their ends; and some of them are not broad minded enough to see beyond the boundaries of Latin America. Yet all of them can sing with him: «When I feel myself an Inca, I render homage to the Sun which gave me the sceptre of royal power; when I feel my Spanish blood, I evoke Colonial days.» Santos Chocano has traveled much and has found a warm welcome in nearly all the Latin American countries. Some years ago he was lionized in Mexico City, and the Central American nations have paid high tribute to his genius. Consult Coester, A., 'The Literary History of Spanish America' (New York 1916); González Blanco, Andrés, 'Select Poems of José Santos Chocano' (Introduction to 'Fiat Lux,' Paris 1908).

SANTOS DUMONT, Alberto, Brazilian aeronaut: b. Palmyra (now Santos Dumont), Brazil, 20 July 1873; educated chiefly in France, and resided almost continuously in Paris until 1928, when he returned to Brazil; Chevalier (1904) and Officer (1909), Legion of Honor. He ascended 4 July 1898 from the Jardin d'Acclimatation, Paris, in a spherical balloon 18 feet in diameter. At this time he was engaged upon the construction of a dirigible balloon which he completed so as to make the trial ascent on 20 September. It proved itself dirigible, but the experiment ended in disaster owing to the insufficiency of the air-pump. A second and a third machine were constructed, the latter being cigar-shaped, 66 feet long and 11½ feet in greatest diameter. It carried a four and one-half horsepower petroleum motor to work a five-foot propeller making 2,500 revolutions a minute. It was steered by a rudder of silk and bamboo having an area of about 25 feet. This machine ascended from Vaugirard, 13 Oct. 1899, sailed to the Champs de Mars, encircled the Eiffel Tower several times, proceeded to Auteuil and finally landed at the manœuvre grounds at Bagatelle. He continued experiments with new balloons, and on 18 Aug. 1901 his balloon collapsed and fell to the roof of the Trocadero Hotel. On 19 Oct. 1901 he won the Henri Deutsch prize of $50,000 offered for a trip from the Aero Club at Saint Cloud around the Eiffel Tower and back to the point of departure in less than an hour. The actual time employed was 29 minutes and 30 seconds, the return being made against a strong wind. In 1902 he went to Monte Carlo with the design of crossing the Mediterranean and after making several ascents suffered an accident which precipitated himself and his balloon into the Bay of Monaco. He turned from the construction of balloons, and in 1909 completed the «grasshopper» monoplane. See AERONAUTICS, HISTORY OF —*The Dirigible;* and consult his 'My Airships' (1904). Died 24 July 1932.

SANUTO (sän'oo-tō), or **SANUDO, Marin,** THE ELDER, of Torcello, Venetian statesman, traveler and geographer: b. Venice, about 1260; d. 1330–38. He traveled widely, knew the coasts and much of the interior of western, central and southern Europe, northern and eastern Africa, and southern and western Asia. He used his vast knowledge of geography and the trade routes of the world in an effort to reawaken the crusading spirit. To further the plan he wrote in 1303–07 his 'Liber secretorum fidelium super Terræ Sanctæ recuperatione' (Hanover 1611; Eng. trans., London 1896). This he presented to Pope Clement V; and in 1312–21 he was engaged upon two supplementary volumes, which when completed were presented with their predecessor to Pope John XXII, together with maps of the world and of Palestine, as well as the cities of Antioch and Acre, and charts of the Mediterranean and Black Seas and the West European coasts. The maps were probably the work of Pietro Vesconte, and on the whole compare favorably with modern maps. The books contain definite plans for the conquest of Palestine, displaying an extensive knowledge of the customs, wealth, extent and population of the countries described. There are 23 manuscript copies of the 'Secreta' in existence, of which the most important are those in the Riccardian Library, Florence; the British Museum, London; and the Paris National Library.

SANUTO, or SANUDO, Marin, THE YOUNGER, Venetian senator, historian and traveler: b. Venice, 22 May 1466; d. 1533. He was of patrician birth, and at the age of 17 went on a journey through Istria and the mainland provinces. He sought out famous people, places of interest and libraries wherever he went, copied inscriptions and made a careful and exhaustive record of his observations and experiences. Because of his exceptional ability he was elected to the Maggior Consiglio at the age of 20, five years less than the legal age, and in 1598 he became a senator. His diaries begin 1 Jan. 1496 and continue until September 1533, covering the proceedings of the legislative bodies in which he served and giving an exhaustive record of his experiences and associations during that period, filling 58 volumes. He was permitted to examine the secret archives of the state, and his friendships included the most famous and learned men of his time; so that his minute and accurate records, governed by his broad learning and rich associations, are of great value and undisputed authority. He collected a splendid library, including foreign as well as Venetian manuscripts, his activities generally fitting him for the post of historian to the republic, an appointment he greatly desired. This, however, twice passed to others, but Sanuto's services as a historian were eventually recognized by the republic through a yearly pension of 150 gold ducats. He was author of 'Itinerario in terra ferma' (London 1847); 'I Commentarii della guerra di Ferrara' (Venice 1829); 'Le Vite dei Dogi' (in Muratori's Rerum Italiacarum Scriptores,' (Vol. XXII, 1828); and the 'Diarii' (Venice 1872–1903).

SÃO FRANCISCO, säñ frän-sēs'kō, a river of Brazil, which rises in the Serra da Canastra, in the southwest of the state of

Minas Geraes, flows north-northeast through that state and the state of Bahia, then turning east forms the boundary between the states of Pernambuco and Alagoas on the north and Bahia and Sergipe on the south. It falls into the Atlantic 50 miles north-northeast of the town of Sergipe by two mouths, one to the north, called Aricari, so shallow as to be scarcely navigable even by canoes; and the other to the south, hence called Francisco do Sul, much larger and deeper, but unfortunately encumbered at its mouth by a large bar about six miles broad, covered with a heavy surf, and with seldom more than four feet of water on it. It is a large and majestic river, with a course which has been estimated at 1,600 miles, but, in addition to the bar at its mouth, has numerous rapids and cataracts, which make its continuous navigation impossible; those at Paulo Affonço, about 190 miles inland, are about 60 miles in length. Its principal affluents are, on the right, the Paraopeba, Guacuhi or Velhas, Jequitahi and Verde; and on the left the Andaia, Borrachudo, Abaité, Paracatu, Urucaia, Carinenha, Correntes and Grande. Railroads have been built around some of the rapids and in conjunction with inland steamers on the river afford continuous communication for about 1,000 miles.

SÃO JOÃO DA BARRA, säñ zhō-ooñ′ dä bär′rä, or **SÃO JOÃO DA PARAHYBA,** Brazil, a town on the Atlantic Coast of the state of Rio de Janeiro, at the northern end of the state. It is the port of Campos, with which it has railroad connection. Pop. 5,000.

SÃO JOÃO DEL REY, děl rā′ē, Brazil, a town in the state of Minas Geraes, situated 75 miles southwest of Ouro Preto, on the railroad running west from Barbacena. It was founded as a gold-mining town, but the gold has been exhausted, and the chief wealth of the town now comes from cattle raising and the manufacture of cloth and leather. Pop. 10,000.

SÃO LEOPOLDO, lā-oo-pōl′dō, Brazil, a town in the state of Rio Grande do Sul, situated on the railroad 18 miles north of Porto Alegre. The town has two churches, a Jesuit college and two high schools. It has had a considerable industrial and commercial development. Agriculture, viticulture and cattle-raising are carried on successfully in the surrounding country, and the town manufactures leather goods. The products of the town have amounted to over $6,000,000 annually, most of them going to Porto Alegre, which, besides the railroad connection, can be reached by steamboats on the Rio dos Sinos. The town was founded by German immigrants in 1824. Pop. 7,500.

SÃO LUIZ DE MARANHÃO, loo-ēzh dā mā ran yän. See MARANHÃO.

SÃO PAULO, Brazil, capital of the state of the same name, and the second city of the country in population and commercial and industrial importance. It is 304 miles southwest of Rio de Janeiro, on the São Paulo Railway. The city is on a plateau, at an elevation of over 3,000 feet above sea level. The temperature is even and moderate, and the air is bracing. The business section, containing the hotels, banks, retail shops and railway stations, is within an area called the Triangle. Two suburbs, Braz and Moorca, are given over to manufactures, and to homes for factory workers. The city has expanded rapidly in recent years. Most of the newer buildings are in the Italian style of architecture. São Paulo has many handsome public and private edifices. The municipal theatre is hardly surpassed in any other city in the world. There are many important industries, among them the manufacture of iron and steel products, textiles, shoes, beverages, cigarettes, and chemical products. Over $60,000,000 is invested in industry. There is a large trade in coffee, agricultural products, frozen meat, sugar, etc. Over 40 per cent of the population is foreign-born. São Paulo was founded by the Jesuits in 1552, and became a city in 1712. It is the site of a bishopric, founded in 1746. Pop. (1936) 1,120,405.

SÃO PAULO, pow′loo, a state of Brazil, bounded on the north and northeast by Minas Geraes and Rio de Janeiro, on the southeast and south by the Atlantic Ocean and Paraná, and on the west by Matto Grosso. Area, 91,310 square miles, including a large section of fertile but unsettled land near the Paraná River, which forms part of the western boundary. The principal mountains are between the capital of the state and Santos, Serra do Mar (average height about 3,000 feet); and, toward the interior, spurs of the Mantequeira range. Adjoining the coast is a comparatively narrow strip or zone, low-lying and tropical in its characteristics; but an abrupt ascent leads from this to the plateau which extends westward to the Paraná, sometimes cut by the valleys of the river system, sometimes rough and mountainous, but in general maintaining an altitude which ensures a temperate climate. In fact, the winters in the southern part of the state are decidedly cold, frosts occurring many times during a single season; and at the capital the temperature occasionally falls below 32° F. The fertile red soil of the plateau is peculiarly adapted to the cultivation of coffee. The railway system of this state, with that of the neighboring Rio de Janeiro (q.v.), is the best in Brazil. A notable piece of engineering is seen on the line which crosses the Cubatão range at a height of more than 2,500 feet. The principal cities are the capital, São Paulo, and the leading port, Santos. For description of the coffee industry, etc., in this state, see BRAZIL. Pop. 4,592,188.

SÃO THOMÉ, tō-mā′, or SAINT THOMAS, Africa, an island in the Gulf of Guinea belonging to Portugal, and situated a little north of the equator in long. 6° 30′ E., 150 miles northwest of Cape Lopez. Its area is 358 square miles. The whole island consists of a volcanic mountain 7,026 feet high, and heavily forested. The climate is equable, temperate and healthful, and the soil is very fertile. The chief products are coffee, cocoa, oranges, lemons, figs, grapes, pine-apples, vanilla, cinnamon, india-rubber, cinchona, etc. The exports are valued at over $10,000,000 annually. Pop. 53,969. There are nine miles of railway in operation. São Thomé forms, with the neighboring island of Principe, a Portuguese province. The capital is St. Thomas, with a safe harbor and a pop. of 3.000.

SAONE, sōn (ancient, ARAR), France, a river which rises at Viomenil, in the department of Vosges, flows southwest through that depart-

ment, traverses the department of Haute-Saône, and on entering the department of Côte-d'Or, receives the Ognon. Continuing a southwest course, past Auxonne, it receives its most important tributary, the Doubs. It flows past Châlons and Maçon to Lyon, where it joins the Rhone after a course of about 280 miles; of these 190 miles are navigable. The Canal du Centre, Canal de Bourgogne and Rhone and Rhine Canal, bring it into communication with the Loire, Seine, Meuse, Moselle and Rhine.

SAOSHYANT. See Sosiosh.

SAP, the fluid which circulates in plants, and consists of water carrying various nutritive salts in solution. This water and its contents, "crude sap," so-called, is absorbed by root-hairs and permeates the plant, passing through the woody portions of the vascular bundles, in the newer rings of the "sap-wood," which, in dicotyledons, constitutes a woody cylinder between the bark and the heart-wood or pith. This sap, by some process which is not fully understood, but which is ascribed to root-pressure, transpiration, or suction, severally or collectively, carries its raw materials to the chlorophyll granules in the green, growing parts of the plant, where they are metamorphosed into organic substances, and are again taken away through the vast cells to those places where they are needed for the life or propagation of the plant, or are stored for future use. Maple and corn sugar, india-rubber, opium and the milk of certain plants are all saps, and the products of the lactiferous cells. Many plants, such as cacti and others, living in desert regions, store away water to carry them through the droughts, a fact which is taken advantage of by travelers in thirsty lands.

SAP-GREEN, a yellowish-green pigment which is prepared by mixing the purplish-red juice expressed from the ripe berries of buckthorn (*Rhamnus catharticus*) with an alkali. The liquid is fermented, evaporated until it has reached a proper consistency, and then suspended in bladders, to harden into a brittle mass. The color is used by water-color painters, paperstainers and leather-dyers, but is very fugitive.

SAPAJOU, or **SAJOU,** a French adaptation of an Indian word, and now applied to several species of American monkeys of the family Cebidae. The sapajous live in flocks in the forests of Brazil, Peru, Guiana, Colombia and Venezuela, and possess tails of feebly prehensible powers, and feed on fruits, eggs, small birds, etc. They are familiar in habits, become soon domesticated, and are thus in favor among mountebanks, etc., who teach these monkeys to become very expert in performing tricks. Common species of sapojous are the sai (*Cebus capucinus*) and white-throated sapojou or sajou (*C. hypoleucos*).

SAPAN, or **SAPANWOOD,** red dyewoods, obtained from two genera of the *Leguminosae,* but principally from *Caesalpinia sappan.* This tree is indigenous to tropical Asia and to the Indian Archipelago, but since it gives a good, red dye, similar to that of brazilwood, although somewhat difficult to fix, its cultivation is promoted in the West Indies and Brazil.

SAPHO. Of Daudet's *Parisian Dramas* the most widely read and most intensely poignant is *Sapho* (1884). Though Edmond de Goncourt pronounced it the author's "most complete, most humane, and most beautiful story," it owed its popularity not alone to its literary merits, which are very great, but also in part to the fact that it dealt with a phase of life that has often a morbid interest for those who, from whatever cause, are precluded from experience of it. The book is dedicated significantly "To my sons when they are twenty," to be to them a warning of the perils, spiritual and material, that encompass every attempt to set up domestic life outside of legitimate marriage. Gaussin, a youth of rich promise but weak will, is betrayed by the very generosity of his eager passion into a connection with Fanny Legrand, a woman who lives by and for sex and knows no law or love but the satisfaction of her animal desire, while she clings to Gaussin with the desperation of a last passion. How through the years of this union Gaussin's young ideals, family connections, material prospects, mental powers, moral character were sacrificed, blighted and betrayed; how he was tortured in turn by jealousy and desire, clung yet shrank, became engaged to another and returned to his degradation, only to find his utter sacrifice uncomprehended, because to such as she incomprehensible—all this is shown with relentless psychoanalysis and undeviating seriousness of purpose. No lighter touches relieve the development of the inevitable tragedy, finely allegorized in an unforgettable opening scene, where the ardent young student carries his new-won mistress up the long stairs to his dwelling, first a light burden, gaily borne, then from landing to landing ever heavier, till it bears him down in utter exhaustion at the end. Consult translations by Ives, G. B., Rogerson, T. F. and others.

Benjamin W. Wells.

SAPINDACEAE, săp-ĭn-dā′sē-ē, a family closely allied to the maples, and containing the soap-berry (*Sapindus*), litchi-nut (*Nephelium*), and other genera. The species are usually tall trees or vines with watery juice. The leaves are generally compound, and alternate, evergreen and abruptly pinnate. The flowers are small, but often showy sometimes apetalous, sometimes with four or five unequal and imbricated petals, and about the same number of sepals; the stamens are eight, and are situated on a disc; the ovary is 3-celled, becoming in fruit capsular or indehiscent, or composed of several wing fruits, or a drupe, or nut, or berry. The species are mostly found in warm countries. The fruits of several, such as the *Nephelium,* are eaten, but the leaves of many are poisonous. The typical genus *Sapindus* has a very saponaceous fruit, used in the place of soap. In Brazil, a paste called "guarana" is made from the pounded seeds of the sapindaceous climbing shrub, *Paullinia cupana,* and serves for food, for medicine (since it contains caffeine), and for the preparation of a refreshing drink.

SAPODILLA, or **SAPODILLA PLUM,** an evergreen tree (*Achias sapota*) some 20 feet high with thick, shining leaves, clustered at the ends of the branches and a milky juice. It is sometimes called bully-tree, also, and is indigenous to tropical America, where it is

often cultivated for its fruit which in the West Indies is sometimes called naseberry. The flowers are small and whitish and the sapodilla, the fruit, resembles a russet apple in color and size and has a milky acrid juice, which disappears when over-ripe, leaving the fruit in a sugary condition and with a pleasant, pear-like flavor. It is a valuable food in warm countries. The seeds are large and black and used as an aperient and diuretic. The juice of the sapodilla is made into chewing-gum, the bark is astringent, and employed as a febrifuge (Jamaica bark), and the wood is reddish-brown, hard, heavy and durable.

SAPONIN, a glucoside contained in the roots of *Saponaria officinalis* or soapwort and many other plants; also in the fruit of the horse-chestnut, in quillai-bark or soap-bark, etc. By means of boiling alcohol it is readily extracted from the root of soapwort, the alcohol, as it cools, depositing the saponin as an amorphous sediment. It derives its name from its behavior with water, in which it is soluble in all proportions, yielding an opalescent fluid which froths when shaken like a solution of soap, if even one one-thousandth part of saponin be present. Its solution, or an infusion of soapwort, is sometimes employed in place of a solution of an alkaline soap for cleansing the finer varieties of wool from grease. Many preparations for cleaning kid gloves, etc., derive their virtues from saponin.

SAPOTACEÆ, săp-ō-tā'sē-ē, a large genus of trees and shrubs of the heath tribe, indigenous chiefly to the tropics and principally to the tropical islands. The leaves are entire, alternate and leathery, with flowers clustered in the axils of the leaves, or at the older stem-nodes. The flowers are regular, bisexual, with stamens borne on the corolla, as many, or twice as many, as its lobes; the calyx-lobes are rigid and obtuse, and longer than the corolla-tubes; the fruits are baccate. The *Sapotaceæ* have a milky juice which furnishes true gutta-percha (q.v.). The sapodilla and star apple of the West Indies are fruits produced by this family. The genus *Bassia* contains species valuable for the oils which they yield and the seeds of *Mimusops elengi* also yield oil abundantly. The sapotads are natives chiefly of tropical India, Africa and America; known genera 21, species 212. Consult Gray, 'School and Field Book of Botany' (1875).

SAPPAN-WOOD. See Brazilwood.

SAPPHIRE, a mineralogical name including all highly colored and transparent varieties of corundum (q.v.), except the red, which is called ruby, an exception confined chiefly to jewelers. Sapphire corundum occurs in three forms — as small, distinct crystals, hexagonal or rhombohedral in various modifications; as transparent portions of ordinary corundum; and at times as nodules or small rounded masses enclosed in ordinary corundum, though distinct. Most gem sapphires are of the first kind; but some fine stones have been cut from material of the two latter kinds, especially in the corundum workings in North Carolina, notably the Culsagee mine in Macon County. Sapphires present almost every variety of color, although blue is the most familiar, deep shades being most valued. Other blue gems occasionally seen are blue tourmaline (called Brazilian sapphire), cyanite and iolite, which is known somewhat as water-sapphire. True sapphires are, however, easily distinguished by their greater hardness (9), and density (3.95 to 4.1). The main sources of sapphire are Ceylon, Cashmere and the Pailin district of Siam, also the Anakie district of Queensland, Australia. In the United States, sapphires are obtained chiefly in Montana; first from the «bars» or low bluffs, of gold-bearing gravel, along the Upper Missouri River, east of Helena and later from a decomposed igneous dike at Yogo Gulch, in Fergus County; also at Rock Creek, Granite County and Dry Cottonwood Creek, Deer Lodge County. The river bars and Rock Creek yield a great variety of rich and delicate colors, as in Queensland, but Yogo Gulch furnishes the deep blue shades most valued and is being worked very extensively. Small and poorly colored stones are largely sold for watch-jewels. All blue and green sapphires, like rubies, possess marked dichroism, a point important to the lapidary, as the tint of gems from such crystals depends upon the direction in which they are cut. In biblical history the sapphire was a stone of an azure color (Exod. xxiv, 10) and very precious (Job xxviii, 16). It was the second stone in the second row of the high priest's breastplate, which is now believed to have been the *lapis lazuli,* and not the modern sapphire, as doubtless was also the stone mentioned in Rev. xxi, 19. Among the Greeks the sapphire was sacred to Jupiter. See Precious Stones.

SAPPHO, săf'ō, Greek poetess: b. Mitylene, or Eresus, Island of Lesbos. She was the greatest of ancient poets of her sex and flourished between 630 and 570 B.C., being a younger contemporary of Alcæus. Little is known certainly of the events of her life. On account of political commotions she left Lesbos for Sicily. But in later years she returned to Mitylene where she became the centre of a female coterie, a school of poetry of which the famous Erinna was a member. She was the author of various poems; hymns, odes, elegies, epigrams — of which only two complete pieces, an ode 'To Aphrodite' and 'To a Maiden,' together with some fragments, have come down to us; these display intense feeling, glowing imagination and a high finish. One of them is quoted in full by Longinus in his treatise 'On the Sublime.' She is said to have invented several metres; at least one still bears her name and has been used by such ancient poets as Horace and such modern ones as Canning in his 'Needy Knife-grinder.' There is an edition of the extant fragments with translations and memoir by H. T. Wharton (3d ed., Chicago 1895). Ancient papyri have recently brought other fragments of Sappho's verse to light. Consult Bergk, 'Poetæ Lyric' (Vol. III, Leipzig 1914); Edmonds, J. M., (in *Classical Review,* Vol. XXII, Vol. XXVIII, London 1909 and 1914); *Classical Quarterly* (Vol. III, ib. 1909); Hunk, A. S. (in *Classical Studies,* Vol. IX, p. 39, ib. 1915) Brandt, P., 'Sappho' (Leipzig 1905); Christ-Schmid, 'Geschichte der Griechischen Literatur' (6th ed., Munich 1912); Farnell, G. S., 'Greek Lyric Poetry' (London 1891); Wright, W. C. 'Short History of Greek Literature' (New York 1907).

SAPPHO. Following the success of his first great tragedy of Fate, 'Die Ahnfrau,' which was written in 16 days, Franz Grillparzer wrote a second poetic drama 'Sappho' (1819), also composed at white heat and resembling 'Die Ahnfrau' in the general character of its poetry although differing from it in form and spirit. In its conception it is half way between the tragedy of fate and the modern tragedy of character; in its form, too, it is half way between the classical and the modern. Out of the slight tradition which tells how Sappho, one of the greatest poets of her age, threw herself from the high Lesbian cliffs into the sea when she found her love for the youth Phaon unrequited and her own handmaiden preferred, Grillparzer has made a stirring drama, with an acting quality strong enough to carry it to success on the stage when well performed. At the same time he has developed a poetic symbolism in the story, and the conflict between the spiritually gifted Sappho and the beautiful Melitta becomes, in Grillparzer's hands, the conflict between art and the pleasures of life. Although the verse has neither the dignity nor the sheer beauty of some of Grillparzer's later work, notably 'Des Meeres und der Liebe Wellen,' it has the cumulative quality which often accompanies verse written in long stretches at a single sitting, a quality which does not detract from its distinctly dramatic value. Through the dignity and the success of his early dramas Grillparzer forged the link that bound the drama of Austria definitely to the literature of Germany.

EDITH J. R. ISAACS.

SAPPHO'S LEAP. See CAPE DOUKATO.

SAPRAEMIA. See BLOOD-POISONING.

SAPROLEGNIACEAE. See FUNGI — *Water Molds.*

SAPROPHYTES, a class of plants living on the carbonic compounds resulting from the decay of organic life. They sometimes contain chlorophyll, but generally do not, and since organs of assimilation are therefore not necessary, the leaves in many kinds are reduced to mere scales. This habit of existing only on decaying organisms makes the higher saprophytic plants very difficult to transplant. Algæ are often saprophytes, making use of the decaying refuse of the sea; and fungi, especially the molds and dung-loving genera as *Splachnum,* are the most generally known cryptogams acting as scavengers in this manner. Even the globular alga, the «red snow» (*Sphærella nivalis*), exists on the corpses of insects, pollen-grains and other decaying materials drifting across the snow. Certain other saprophytes attach themselves to the bark of trees, not to suck the juices of the host in the manner of parasites, but to subsist on the decaying bark and on the organic dust and material in solution washed down by the rain and stopped by the projecting mass of the plants. Many saprophytic plants living in the cracks of rocks have only the humus collected in tiny pockets and the supply of dissolved organic matters in percolating water, to draw upon. Some orchids, as the coral-roots (*Corallorhiza*), that have no true roots, but a thin-skinned rootstock, which absorbs nutriment directly; the familiar Indian pipes (*Monotropa*) and others spring from the humus of decaying leaves, in close connection with the hyphæ of fungi. The meadow pastures support such saprophytes as the true mushroom (*Agaricus campestris*), the moonwort (*Botrychium lunaria*) and the blue and violet flowered gentians. These micro-organisms, non-virulent and always present in animal intestines, may in certain conditions become virulent poisons. See BOTANY; FUNGI.

SAPSUCKER, the popular American name of several small woodpeckers, but properly restricted to the yellow-bellied woodpecker (*Sphyrapicus varius*), an Eastern species represented in the Rocky Mountain region by variety *nuchalis* and along the Pacific Coast by variety *ruber.* This woodpecker is of moderate size; is black and whitish above; black on breast; rump black and white mixed; belly more or less yellowish; sides streaked with dusky; crown red in the adult; chin scarlet and throat black in the male, but both white in the female. This bird illustrates well the curious tendency toward increase of red in plumage toward the Pacific Coast. In variety *nuchalis,* the nuchal band is red instead of brown, extending the chin red by so much; in specimens from Nevada, the scarlet area is still larger; and in the Coast form (*ruber*) the whole head, neck and breast are red, sometimes obliterating the normal pattern. This woodpecker is migratory, spending its summers and breeding only in the cooler parts of the United States and northward, and going South in midwinter. Its habits differ from those of other woodpeckers mainly in its custom of drilling a great number of holes in the bark of trees, to get at and eat the new wood and sugary sap lying beneath it. In many cases serious harm is done to fruit trees by the great number of chains of holes so bored, although many harmful insects are also devoured. See WOODPECKERS, and consult authorities cited thereunder.

SAPUCAIA (săp-oo-kīa) or **PARADISE NUTS,** the seeds of *Lacythis zabucayo,* or sometimes those of *L. ollaria,* belonging to the *Myrtaceæ* and closely allied to the Brazil nut. The trees, often 75 feet high, grow abundantly in the northern part of South America. The nuts which have a sweet almond-like flavor are more wholesome than Brazil nuts. They are about two inches long and an inch thick, with a corky shell furrowed lengthwise, and are found in hard urnshaped fruits, six inches across and with a woody wall half an inch thick. These curious, very hard capsules, have lids which fit closely, but fall off when quite ripe. Like the fruits of other members of the genus they are called monkey-pots, perhaps not only on account of their shape, but because monkeys are said to be very fond of the seeds, which are scarce for this reason. An edible and soap-making oil, which soon grows rancid, is expressed from sapucaia nuts.

SAPULPA, sa-pŭl'pa, Okla., city and Creek County seat, alt. 825 feet; on the St. Louis-San Francisco Railway, 102m. NE. of Oklahoma City. The Sapulpa Union Railway (electric) links the city with the Atchison, Topeka and Santa Fe Railroad at Tulsa. Oil and natural gas abound in the surrounding country, and the region is agriculturally rich. Glass is the principal

industrial product. There are glass, brick, and tile works. Sapulpa was founded in 1888, and incorporated in 1898. The name is from that of William Sapulpa, a Creek Indian, who established a trading post on the site in the early 1880's. Pop. (1940) 12,249; (1950) 13,031.

SARABAND, săr'ă-bănd, a dance said to be derived from the Saracens. Its character is grave and expressive. It originated in Spain, where it was formerly danced to the castanets. Leading composers frequently wrote tunes of this description for the harpsichord or clavichord. It became popular in Europe in the 16th century, but was prohibited for a time in Spain because of its indecency.

SARACENIC ARCHITECTURE. See MOHAMMEDAN ART.

SARACENS, săr'ă-sĕnz, a people mentioned by Ammianus Marcellinus (q.v.) as inhabiting the northern district of Arabia Felix. At the period of the Crusades the term was employed to designate all infidel nations, against which crusades were preached; and in course of time it became the generic name of all the Arabian tribes, who embraced Mohammedanism and extended their conquests in Asia and Africa.

SARAGOSSA, să-ră-gŏs'ă, or **ZARAGOZA** (ancient CAESAR-AUGUSTA), Spain, (1) capital of a province of its own name and of the ancient kingdom of Aragon, situated on the river Ebro, in a fertile plain, 174 miles northeast of Madrid. The see of an archbishop, it has two cathedrals, a university, a Moorish citadel, and many fortress-like palaces. Manufactures include cloth, silk, and porcelain. Saragossa was the Salduba of the Celtiberians, but the walls are all that remain of the ancient city. It renounced paganism at an early period and Aurelius Publius Clemens Prudentius (q.v.), the first Christian poet, was born here in 348 A.D. It suffered from various wars, and in 1808–1809 sustained two memorable sieges, costing 60,000 lives, but finally capitulated to the French. The part played in the latter siege by Augustina, the "Maid of Saragossa" (d. Ceuta, Spanish Morocco, 1857), was described by Lord (George Gordon) Byron (q.v.) in *Childe Harold.* Pop. (1944 est.) 266,483.

(2) The province of Saragossa contains 6,611 square miles. The highest elevation is 7,700 feet. On the northwest are the spurs of the Pyrenees. Pop. 617,356.

SARAH (Heb. princess), the daughter of Terah, half sister and wife of Abraham, who in her 90th year bore to him a son, Isaac, according to the promise of God. She died in Hebron at the age of 127 years. See ABRAHAM.

SARAJEVO, să'ră-yĕ-vô, Yugoslavia, capital of the Bosnia Herzegovina Republic created by the constitution of 1946, on the Miljacka River, 122 miles southwest of Belgrade (Beograd). Ruins of a 13th-century Hungarian castle crown a hill above the town. The town contains Roman Catholic and Greek Orthodox cathedrals, and numerous Mohammedan mosques. The assassination here of the Archduke Francis Ferdinand on June 28, 1914, precipitated World War I. Pop. (1948 est.) 118,158.

SARANAC LAKE, săr'ă-năk, village, New York, in Franklin and Essex counties, altitude 1,540 feet; on the Saranac River, near Lower Saranac Lake. It is served by the New York Central Railroad. It is noted as a health resort, and offers also year-round facilities for sports. In the summer the New York Giants football team trains here, and in the winter it houses the New York Rangers hockey team.

Here in 1894, Edward Livingston Trudeau established his outdoor sanatorium and laboratory for the study of tuberculosis. The Will Rogers Memorial Sanatorium was opened in 1930.

Manufactures include wood products and clothing. The region surrounding the village is agricultural. Settled in 1819, it was incorporated in 1892. The government is by city manager. Pop. (1950) 6,913.

SARASOTA, săr-ă-sō'tà, city, Florida, and Sarasota County seat, altitude 18 feet; on Sarasota Bay, an arm of the Gulf of Mexico. It is served by the Atlantic Coast Line and the Seaboard Air Line railroads; and has a municipal airport and seaplane base. The city is a shipping point for an area in which celery and citrus fruits are grown, and Brahman cattle are raised.

It is the winter quarters for the Ringling Brothers Barnum and Bailey Circus. It has a public library, a civic center, municipally owned Lido Beach and a municipal auditorium. The Ringling Museum of Art contains one of the country's finest collections of great paintings, including America's most outstanding collection of works by Peter Paul Rubens. The city has city-manager government. Pop. (1950) 18,896.

SARATOGA, Battles of, two battles of the American Revolution, called also the battles of Bemis' Heights, or of Stillwater, fought on ground about 12 miles east of Saratoga Springs and near the Hudson River. Both battles were fought under the same officers, the Americans being commanded by Horatio Gates (q.v.), who was ably served by Benedict Arnold and Daniel Morgan (qq.v.), and the British by John Burgoyne (q.v.). The first battle, Sept. 19, 1777, was indecisive. Burgoyne attacked Gates' army on Bemis' Heights, at Stillwater, about 4 P.M., and both sides claimed the victory in the ensuing engagement, which lasted until dark. The British loss was more than 500 men, while that of the Americans was under 400. The second battle, on Oct. 7, 1777, was the turning point in the American Revolution. Burgoyne launched another attack on the American position, but it was met by a counterattack which, after a sharp engagement, ended in the repulse of the British, who retreated 12 miles from Saratoga. There they entrenched themselves, but on October 17 Burgoyne surrendered to Gates with the honors of war. The troops surrendered numbered 5,791, and 42 field guns were taken. Congress refused to ratify the capitulation, which provided that the British should freely take passage for England on condition of not serving again against the Americans. As a result the captured British, with the exception of Burgoyne and a few other officers, were held as prisoners until the end of the war.

SARATOGA LAKE, a lake in Saratoga County in New York State, about four miles east of Saratoga Springs. It is a favorite place for

regattas; it has a straightaway course three miles long and is wide enough to accommodate eight racing sculls abreast.

SARATOGA SPRINGS (derived from the Indian word Saraghoga meaning "place of swift water"), N. Y., city and famous health resort in Saratoga County; altitude 330 feet; 25 miles northeast of Schenectady and 181 miles north of New York City; on the Delaware and Hudson Railroad. Saratoga Springs is situated at the foot of the southernmost spur of the Adirondack Mountains. Saratoga Lake (q.v.) is about four miles distant. Principal points of interest are the Casino, once the gambling house of Richard Canfield and now the headquarters of the Saratoga County Historical Society (the middle section has been made into a convention hall); the ancient cone of the High Rock Spring; the Avenue of Pines; Congress Park, with the Spencer Trask (q.v.) Memorial Fountain; the hotels; and the Saratoga Spa. It is the seat of Skidmore College (q.v.) for women. Near Saratoga is "Yaddo," the famous private estate of Spencer Trask, later providing hospitality for creative artists. The place was first settled in 1784, and Edgar Allan Poe (q.v.) visited it in 1843, during which time he is supposed to have written the first draft of *The Raven*.

The State of New York established a reservation about the chief mineral springs in 1909, and approximately 1,300 acres of land were subsequently included within it. Most of this land is in the High Rock, Lincoln, and Geyser parks, and upon this property are 83 natural springs and wells, including most of the naturally mineralized and naturally carbonated waters in the Saratoga region.

The French Catholic missionaries were the first known white men to visit this region. In 1684 the land now constituting Saratoga Springs and adjacent counties was ceded to the Dutch by the Indians. The first white owner of the now celebrated springs was Rip Van Dam; and Sir William Johnson (q.v.) was the first white man to test the efficacy of the waters when Mohawk Indians brought him here to bathe. The Indians called one of the springs "Medicine Spring of the Great Spirit," and warned away a white man who had built a cabin too close to the spring. In 1774 the first crude hotel was erected. Since 1826 the waters have been bottled and sent to various parts of the world. The Saratoga battlefield, the scene of the surrender of Gen. John Burgoyne to Gen. Horatio Gates, Oct. 17, 1777, is 12 miles east of the city. Gideon Putnam in 1802 built Union Hall near Congress Spring, the first large hotel at the Spa. In 1811 Congress Hall was erected, and in 1824 the first United States Hotel. Pop. (1950) 15,473.

SARATOV, sä-rä'tôf, USSR, capital of the Saratov Region, RSFSR, on the Volga, 459 miles southeast of Moscow. In addition to numerous oil and flour mills, leather, tobacco, textiles, and candle factories, machine and railroad shops, and shipyards, the city contains a university and several museums. Saratov was founded in 1605. Pop. (1939) 375,680.

SARAWAK, sä-rä'wäk, a British colony in Borneo (q.v.).

SARCEY, sår-sā', **Francisque**, French journalist and dramatic critic: b. Dourban, Oct. 8, 1828; d. Paris, May 15, 1899. After several years spent in general journalistic work he became dramatic critic for *Le Temps* (1867); in this position, which he held until his death, he was a dictator of dramatic criticism, his word being accepted as final by a large part of the public. He was the author of *The Word and the Thing* (1862); *Le Siège de Paris* (1871), which reached 30 editions in its first year; *Etienne Moret* (1875); *Comédiens et Comédiennes* (1878–1884); *Souvenirs de Jeunesse* (1884); *Company of Actors* (Introduction by Brander Matthews, New York, 1926).

SARCINA, sär'sĭ-nà, a genus of microscopic fungi, consisting of cubic or prismatic masses, made up generally of 8, 16 or 64 rounded, cubic cells, the faces of each cell being divided into four frustules or projections by two light grooves which cut each other at right angles. Each cell has a diameter of about $\frac{1}{100}$th to $\frac{1}{120}$th of a line, and consists either of a completely homogeneous mass only, without nucleus or granulations, or of such a mass with four, sometimes two or three nuclei. The cells are separated from each other by rectangular striae.

SARCINE or **HYPOXANTHINE**, $C_5H_4N_4O$, a weakly basic organic substance closely related to xanthine and to uric acid; found in the muscle juice and in many other fluids of the body. Consisting of colorless crystalline needles, slightly soluble in cold water, more so in hot, it unites with acids and certain metallic oxides to form compounds, many of which are crystalline.

SARCODINA, sär-kō-dī'nà, a class of unicellular organisms (protozoa) that are without an external membrane or cell wall. During the active, or vegetative, stage of existence they form pseudopodia, processes of the protoplasmic body substance by which locomotion is achieved and food material seized and taken in. For protection many of them construct a shell of lime, silica, or chitin, though a few cement together fragments of foreign material to form such a test. The common ameba, very similar in general structure to the white blood corpuscles, is usually regarded as a typical representative of the group. It illustrates the simplest forms, in that no skeleton or other specialized structures are present, although at certain times a temporary cyst wall is formed as a protection against cold or draft, or during spore formation. The character of the pseudopodia and of the shell are the main factors utilized in distinguishing the subdivisions of the class. Certain amebae are parasitic and are indistinguishable in general structure from the free-living species. They are, indeed, doubtless descended from slime-inhabiting forms which would require very little physiological modification to adapt themselves to parasitic existence in the intestine.

Most species exhibit under a high power a narrow marginal zone of clear material, the hyaline ectoplasm, which includes a more fluid granular endoplasm. The latter is in constant movement and contains food particles, non-contractile vacuoles, reserved materials, waste products, and one or more nuclei. The contractile vacuoles are located at the indefinite boundary line between the ecto- and endoplasm. They are, however, rarely found in parasitic species.

The parasites of amebic dysentery have been known since 1860 but the form known as *Endamœba coli,* which is believed by the majority of investigators to be harmless, has only recently been clearly differentiated from the pathogenic species *E. histolytica.* Both often occur together in the human intestine. While amebic dysentery is in general a disease of the tropics and subtropics the Mayo Clinic has tabulated within a short period over 500 cases which came from every northern State in the Union and from the Canadian Northwest. Infection in temperate regions is much less frequent than in the tropics where, as in the Philippines, e.g., careful reports show an infection of 37.5 per cent.

The free living Sarcodina fall chiefly in two orders. Among the most abundant of marine animals are the Rhizopoda whose calcareous shells also form large deposits in the rocks. The Radiolaria are equally abundant in the Pacific and connecting oceans as well as in fossil strata. These forms construct a skeleton of silica the form of which is characterized by sharp radiating spicules. The number and variety of these organisms is beyond conception. They form a considerable part of the bottom ooze found in the deep sea everywhere.

Other free living species are abundant in fresh water bodies and in fact occur in almost any moist environment. Recent discoveries have even disclosed the occurrence of enormous numbers of small amebæ in surface soils where they live in conjunction with various types of bacteria and are believed to play an important part in determining the fertility of the soil.

HENRY B. WARD,
Professor Emeritus of Zoology, Univ. of Illinois.

SARCOMA. See TUMOR.

SARCOPHAGUS, originally the name given to a kind of stone that used to be quarried at Assos in the Troad, and which was employed for coffins or tombs: a coffin made of this stone was supposed to possess the property of consuming within a few weeks a dead body laid in it: in Greek *sarkophagos* means flesh-consuming, or flesh-devouring. Sarcophagus is now used only in the sense of coffin or tomb made of stone, or of terra-cotta or concrete as in the case of the highly ornate tombs which are found among the remains of ancient Etrurian art. Some of the sarcophagi found in Egypt are contemporary with the pyramids: the earliest are squared or oblong, the later ones, whether plain or ornamented with reliefs, have the same shape as the swathed mummies. Phœnician sarcophagi were modeled like the mummiform sarcophagi of Egypt, and were of marble or basalt; some of them showed the principal contours of the body. Before cremation of the dead came into general use at Rome, the illustrious dead were deposited in massive sarcophagi; celebrated among these is the tomb of the Scipios; under the empire Roman sarcophagi were very elaborately ornamented after the manner of the Etrurians. In modern times deceased men of great eminence or great wealth are sometimes laid away in stone chests or sarcophagi. Consult Morey, C. R., 'Sarcophagus of Claudia Antonia Sabina and the Asiatic Sarcophagi' (Princeton Univ. Press 1924); Fowler, 'Handbook of Greek Archaeology' (1909); Myres, 'Handbook of the Cesnola Collection' (New York 1914).

SARCOPSYLLA, a genus of parasitic fleas which bury their heads in the flesh of their hosts and create bad sores. The most noted species is *S. penetrans,* the chigo (q.v.). In our southern States and elsewhere another species, the chicken-flea (*S. gallinacea*), buries itself in the eyelids of domestic fowls.

SARCOSINE, methyl glycocoll, methyl glycine, $CH_3.NHCH_2.COOH$, a substance discovered by Liebig in the decomposition product of the creatine obtained from meat extract. Later made by the action of methyl-amine on monochlor-acetic acid. A colorless crystalline compound easily soluble in water.

SARD, a translucent, reddish-brown variety of chalcedony, extensively used as a ring-stone. See CORNELIAN.

SARDANAPALUS, sär-da-na-pā'lŭs (ASSURBANI-PAL) Assyrian king, ruled 668–625 B.C. He was the eldest son of Esarhaddon, grandson of Sennacherib, and great-grandson of Sargon. His father resigned the throne to him in 668 B.C., reserving only Babylon to himself. The following year the father's death left Sardanapalus sole ruler. Revolts being common upon a change of rulers, the attention of the new Assyrian king was called to the suppression of one in Egypt, where Tirhakah of Ethiopia had overthrown the system of princes tributary to Assyria. Tirhakah was driven southward out of Egypt after a disastrous battle, but his successor renewed the revolt and met with defeat. Thebes was robbed of an immense amount of treasures of art and wealth. Tyre also revolted, but after a prolonged blockade its king submitted. The kings of Arvad, Cilicia and Tabal were put in subjection, and Gyges of Lydia, who besought an alliance with Sardanapalus to aid him against his Cimmerian enemies from the Black Sea region, found he was accepted on terms which implied submission; and when later he assisted Psammetichus in throwing off the Assyrian yoke in Egypt he was destroyed by Sardanapalus. War broke out with Urtaku, king of Elam, who had made a raid upon Accad, ruled by the brother of the Assyrian king. It took a long struggle to complete the subjection of the country but it was accomplished finally during the reign of Teumman, Urtaku's usurping successor. After a great victory near Susa, Urtaku's sons were placed over the kingdom as Assyrian vassals. The decline of the empire began when the king's brother, Samas-sum-ukin (or Shamash-shum-ukin), ruler of Babylon, as vassal-king, instigated a revolt which was so widespreading as to include Elam, Arabia, Egypt, Chaldæa and other Asiatic countries. Egypt alone under Psammetichus secured her independence. Babylon was taken after a long siege and Samas-sum-ukin perished in the flames of his burning palace. Between 646-640 B.C. Elam was subjugated and Susa, after being pillaged, was razed to the ground. Sardanapalus celebrated his victories in Arabia by a triumphal procession through Nineveh.

Assurbanipal figures in classical literature under the name of Sardanapalus and there is described as a mere sensualist. Though cruel and implacable to foes, he was an enlightened despot, and literature and art, particularly architecture, flourished in his reign and attained

their highest degree of perfection. The king collected a famous library of all the known cuneiform tablets. The remains of his splendid palace with its priceless library were excavated at Kuyanjck. The tablets now belong to the British Museum, and form the basis of our present knowledge of the civilization and history of Assyria. Consult Oppert, 'Histoire des Empires de Chaldée et d'Assyrie'; Lenormant, 'Manual d'Histoire Ancienne de l'Orient' (1869); Rawlinson, 'Five Great Monarchies of the Eastern World' (1879); and the works cited of A. H. Sayce (q.v.).

SARDINES (sär'dēnz') **AND SARDINE FISHERIES.** The name sardine is a general one applied to various small fishes of the family *Clupeidæ* as well as, and less correctly, to the young of some of the larger species. «Thus, there are the Spanish sardine of the West Indies and Florida; the California sardine, found along the entire west coast of the United States; the Chile sardine; the oil sardine of India, and the sardines of Japan and New Zealand. But the sardine *par excellence* is the French sardine, so-called from the island of Sardinia, in the Mediterranean, about whose shores the fish are abundant.» The sardine or pilchard (*Clupea* or *Clupanodon pilchardus*) is usually about five or seven inches long, of an olive-green color above and silvery on the sides and below, with very large easily displaced scales, only about 30 of which form a complete longitudinal row. The usual French sardines are the yearling fish of what becomes, when full grown, the pilchard of English fishermen, attaining a length of 8 to 10 inches. Geographically it ranges throughout the Mediterranean; in the Atlantic from Madeira to Ireland and in the North and Baltic seas. They feed on minute crustaceans, larval forms and floating fish-eggs, the only kind of food for which their nearly toothless mouths are adapted. The pilchard spawns throughout the summer in the open sea, laying about 60,000 buoyant eggs. On the coast of Brittany, where the principal fisheries are located, sardines are now caught throughout the summer, and to a less extent at other seasons, exclusively by means of gill-nets of very fine twine and small mesh, which varies to suit the size of the run of fish. These nets are dyed blue, partly to preserve, partly to render them inconspicuous in the water; and the schools of fish are tolled into them by means of a bait made of the salted roes of various fishes, chiefly cod. The nets are operated from small two-masted boats which never go beyond a few miles from the shore. The catch is brought ashore and a portion is consumed fresh, but the bulk is sold to the canning factories.

The fishes, when bought for curing, are first beheaded and then gutted, and sorted according to size. They are then washed in sea-water and dried by being suspended on wire screens, nets or willows in the open air, and are then plunged into a cauldron of boiling olive-oil. For the cheaper grades peanut or cottonseed-oil is used. The sardines are laid in the cauldron on wire gratings, two rows deep, and are kept therein until sufficiently cooked, when they are taken out and allowed to drip, the oil-drippings being carefully collected. They are packed in the tin cases, which are filled with oil, and sealed hermetically. Throughout the process the greatest care is exercised to keep the fish in the best condition. The offal and waste of the sardine-curing industry is sold as manure to the farmers.

The sardine fishery is the most important fishery industry of France, employing before the war about 32,000 fishermen and more than 8,000 boats, and yielding an annual product of about 60,000,000 kilograms of sardines, valued at about 9,000,000 francs. At the last ante bellum enumeration about 15,000 persons were employed in the canning factories with an annual output of 4,000,000 or 5,000,000 boxes. The better grades are consumed in France, but the United States imports French sardines, chiefly of the cheaper grades. Sardines are also packed to a smaller extent elsewhere in Europe, especially in Spain and Portugal.

In the United States a true sardine (*C. cæruleus*) occurs on the coast of California, and the industry has developed from small beginnings to one of great importance, employing a large amount of capital, and many men. In the East the sardine industry of the United States centres about Eastport, Me., where the young of the herring is packed. These fish are caught chiefly in brush weirs (see POUND-NET FISHING) and are sold to the canneries, where they are treated in general after the French method with some local modifications. Drying rooms or ovens are employed in place of the open air; when ovens are used the fish are not boiled in oil, but are at once sealed; cottonseed-oil is almost universally employed instead of olive-oil; and various labor-saving devices have been introduced. The product is distinctly inferior to the best or even middlegrade French sardine. Judging from the results attained in the canning of the California sardine, this variety promises to rival the French product. The average annual output in Maine and California exceeds 1,700,000 cases in each State. The United States in 1935 exported 103,248,000 pounds of sardines, valued at $7,139,000, and imported about 25,000,000 pounds, valued at $3,600,000.

SARDINIA, sär-dĭn'ĭ-ą, **Island of** (Italian, SARDEGNA), in the Mediterranean Sea, south of the island of Corsica, from which it is separated by the Strait of Bonifacio, not quite seven miles wide, extend between lat. 38° 50′ to 41° 15′ N., and long. 8° 5′ to 9° 50′ E. It is 152 miles long from Cape Teulada in the south to Longo Sardo in the north, and has a central breadth of about 66 miles. Its total area is 9,301 square miles divided into three provinces of the kingdom of Italy: Cagliaro (comprising the districts of Cagliari, Iglesias, Oristano and Lonusei); Sassari (comprising the districts of Alghero, Ozieri, Sassari and Tempio); and Nuoro, all named after the principal cities of the respective districts. The density of the population is 94.7 per square mile. Cagliari (q.v.) (pop. 94,902) is the capital. Before the consolidation of the Italian kingdom in 1861, Sardinia with its surrounding is-

lands, the principal of which are San Antioco, San Pietro, Asinara, Madalena, Tavolara and Caprera formed that part of the Sardinian states named the Kingdom of Sardinia. See SARDINIAN MONARCHY.

Topography.— The island is nearly in the form of a parallelogram. In a prehistoric age it was united with Corsica. The interior is generally mountainous, the great chain which traverses Corsica from north to south being evidently, notwithstanding the interruption of the Strait of Bonifacio, continued into Sardinia, where it usually follows the same direction, but occasionally sends out transverse branches east to west. The culminating point is the peak of Generagentu, situated a little to the east of the centre of the island, which attains the height of 6,132 feet. Between the mountain ridges are several extensive plains, of which the most celebrated for beauty and fertility are those of the Campidano in the south, and of Ozieri in the north. There are several large sandy or stony districts called *macchie,* of a very sterile nature. The streams are numerous, and add considerably to the fertility of the districts through which they pass, but are of no navigable importance. The Tirso, the largest, pours its waters into the Gulf of Oristano on the west coast. The lakes are situated chiefly in the vicinity of the coast, where they form a series of lagoons. Sardinia has a total coast line of 835 miles. The north coast is generally rugged and precipitous, presenting a succession of bold headlands. The principal bay is that of Porto Torres, in the Gulf of Asinara. The west coast is extremely diversified in character, rocky headlands (the principal of which is Cape Argentiera, 5,200 feet high), beaches, low hills, tablelands, open bays and bold islets succeeding each other. Guarding the strait of Bonifacio a group of fortified islands constitutes the naval station of Maddalena. Cape Teulada, nearly 900 feet high, forms the most southerly point of the island. Turning north from Cape Spartivento a number of rocky islets present themselves, lining a low and marshy beach, which continues almost unbroken. The Island of San Macario forms the southwest entrance of the Gulf of Cagliari. This gulf, besides having the capital situated on its northern shore, everywhere furnishes excellent anchorage in ample depth, and in the grounds along and behind it exhibits the best specimens of cultivation of which Sardinia can boast. The east coast, from Cape Carbonara northward, stretches nearly in a straight line, the continuity of which is seldom interrupted by indentations. The most conspicuous of all the headlands is that of Monte Santo, a rugged promontory upward of 2,400 feet high, sloping toward the sea, and terminating in bold precipices of limestone, within which is an extensive cave fantastically adorned with enormous milk-white stalactites.

Geology.— The greater part of the rocks are of crystalline texture and belong to the earliest formations, consisting of granite, overlain by gneiss and mica-schist. Trachyte, basalt and other rocks of volcanic formation are most largely developed in the Northwest, but also occupy a greater number of isolated spots throughout the island, and more especially in the southwest, where the adjacent islands of Saint Pietro and Saint Antioco are almost entirely composed of them. In many cases the mouths of ancient craters and the lava-streams issuing from them can be distinctly traced. Sedimentary Silurian rocks break the continuity of the granite on the east, and a large tract in the southwest belongs to the same formation, extending in a southwest direction till it reaches the southern extremity of the island and forms the remarkable promontory of Teulada. The limestones and chalks at the top of the secondary formation are not largely developed, but occupy a number of isolated tracts both in the interior and on the coast. In the latter portion they form conspicuous objects in the northwest, where the cliffs to the north of the Gulf of Alghero are composed of them, and in the east, where they form the great mass of Monte Santo and contain its celebrated stalactical cave. Tertiary rocks of travertine, marl and sandstone occupy a considerable tract near the town and along the Gulf of Sassari, and also in the south, where they form the eastern boundary of the plain of Campidano. That plain itself, however, has a deep covering of alluvium, which partly accounts for its remarkable fertility. Similar tracts of alluvium, though of much more limited extent, are found in the Plain of Ozieri in the north and along the Gulf of Palmas in the south and that of Paglia in the southwest.

Minerals.— The mineral riches of the island were well known to the ancients, whose extensive workings can still be traced. Tradition enumerates gold among its metals, but no traces of it can now be found. Lead, however, exists in considerable abundance, and is generally highly argentiferous. Mines of it are profusely scattered over various districts. Zinc ore (calamine) is worked, also lead ore; and both are exported. Copper occurs in several quarters and occasionally furnishes beautiful specimens of malachite. Quicksilver has been found and was once partially worked, and both bismuth and antimony are said to exist; iron of excellent quality is plentifully distributed and is worked in several districts. The other mineral products deserving of notice are porphyry, basalt, alabaster, marble, volcanic enamels, rock-crystals and a variety of beautiful pebbles, lignite, gypsum and nitre. Salt, in its mineral form, is found only in the grottoes of Serrenti, but is extensively obtained from the salt-pans along the coast, and forms one of the most profitable sources of royal revenue, for the sake of which it is strictly maintained as a government monopoly. There are about 12,000 engaged in mining, and the island takes fifth place in this industry among the Italian provinces.

Climate.— The climate of Sardinia has for many ages borne a very bad name; at certain seasons large districts become so insalubrious as to be regularly deserted by their inhabitants, while in others the mortality is remarkably great. The range of the thermometer is between 34° and 90° and the mean annual temperature 61° 7″. Hence neither heat nor cold can be said to be in excess. During the hot season, in the low-lying lands, miasmata are continually arising to taint the air, the malignant properties of which become so virulent at night or in the cool of the evening that the natives never quit their homes until an hour after sunrise and hasten to return before sunset, carefully closing every door and window. The disease which then prevails is

known by the name of *intemperie,* and is said to be even more fatal than the malaria by which parts of Italy and Sicily are infested.

Flora and Fauna.— The whole surface of Sardinia has been divided into three portions — one occupied by mountains, where not absolutely barren, is covered with forests or clothed with pasture; one occupied by marshes, lagoons and the almost sterile *macchie,* and one under tolerably regular culture, as arable land, olive-yard, vineyard, etc. See paragraph on *Agriculture.*

Game of all kinds is very abundant. Wild boars, stags, deer and mufflons frequent the woods and forests; and foxes, hares and rabbits are so numerous that their skins furnish a considerable article of export.

Fisheries.— From the extent of seacoast the fisheries naturally form an important branch of industry, which, however, is almost entirely in the hands of strangers. The most valuable fishery is that of the tunny, which is carried on extensively on various parts of the coast. Anchovies and sardines, the latter at one time so numerous as to have derived their name from the island, have become comparatively scarce. Fine mullet, bream, eels and other fish abound, and are staple articles of consumption and commerce. The coral fisheries, more celebrated in ancient than in modern times, are still carried on on the western and southern coasts. The *Pinna nobilis* also, the inhabitant of a shell of from 15 inches to 27 inches in length, abounds in the smooth water of shallow bays, as at Porto-Conte and Liscia, and is the object of an important fishery, partly on account of the pearls, generally of very indifferent quality, obtained from it, and still more on account of its byssus, or tuft of silky hair, which is about eight inches long, and is spun into gloves, stockings or other articles of dress.

Ethnology.— The inhabitants resemble the Spaniards rather than the Italians in character. Their demeanor is grave and dignified compared with the vivacity of the Italians, and they are characterized by their unwavering fidelity to their sovereign, their chivalric sense of honor and their hospitality. They suffered much, however, from long neglect and misgovernment, are ignorant and bigoted, and when they have received an injury are insatiable in their thirst for revenge, but the celebrated blood-feuds are now uncommon and brigandage has ceased. With the exception of the inhabitants of Cagliari and Sassari, the two chief towns of the island, the Sardinians have as yet been little influenced by the modern advances of civilization, and in some remote districts the traveler may imagine himself translated to a period several centuries earlier.

Agriculture.— Much of the land is of remarkable fertility but the system of agriculture pursued is imperfect. The Italian system of partnership or *colonia parziaria,* more especially in *mezzadria,* consisting in a form of partnership between the proprietor and the cultivator, is practised to some extent. The grain raised considerably exceeds the consumption of the present inhabitants, and might easily be increased so as to supply three times the number. The whole operations of the farm are conducted in an antiquated manner. The principal crop is wheat, which is generally of excellent quality, and forms an important article of export in the form not only of grain but of flour, biscuit and macaroni. The culture of barley is more limited and the quality of the produce is comparatively inferior; maize thrives well, and though not yet a general crop is rising rapidly into favor; beans and peas are extensively grown both for home consumption and export. Dairy farming flourishes, the island being second of the Italian provinces in cheese production. The vine is well adapted both to the climate and the soil. The produce, however, is more remarkable for its quantity than its quality, all the preparatory processes being conducted in a careless and imperfect manner. The most esteemed wines are those of the Campidano, Alghero, Sorso and Ogliastro. Beautiful and extensive olive-grounds are met with in various quarters, but the culture might easily be extended and made much more profitable than it has yet proved to be. The best oil is that of Sassari. The only other crops deserving of notice are tobacco, which is grown to some extent in several districts, but particularly around Sassari, Alghero and the adjacent villages; linseed, which is produced in the greatest abundance in the neighborhood of Oristano; cotton, for which the soil and climate of the Campidano appear well adapted; madder, which grows wild in many parts of the island, and, though neglected, might easily be cultivated to great advantage; and silk, well fitted to become a staple product, but at present produced chiefly for amusement.

Industries and Commerce.— Manufactures have made very little progress and are chiefly confined to a few coarse tissues woven by the women at their homes for private use. Tobacco and gunpowder — both, like salt, government monopolies — are manufactured to a considerable extent. Industrial establishments number 4,015, with 34,016 employees, utilizing 13,064 horse power, according to available statistics. The trade consists of the exports of raw produce, the greater part of which have already been enumerated, including corn, wine, brandy, timber, seeds, fish, cattle, lead ore, calamine, salt, tobacco, etc.; the imports include all the ordinary tissues, more especially cotton, colonial produce, hosiery, hardware and metals, hemp and cordage, etc. One great obstacle to the progress of trade was the miserable state of the roads, but good roads have now been made and railway lines constructed. The coinage, weights and measures are the same now as those on the mainland.

Language, Education, Religion, Government, etc.— The language consists of a number of dialects differing widely in many of their roots; several of them closely resemble Spanish. Over 73 per cent of the inhabitants are unable to read or write. There are two universities, one at Cagliari and the other at Sassari. The people are Roman Catholics. Sardinia now has a provincial government similar to the rest of Italy.

History.— The early history of the island is involved in much obscurity. Its prehistoric monuments of the Bronze Age (2000–1800 B.C.) are of considerable archæological interest. Its original inhabitants, according to Cicero of Libyo-Phœnician, and according to Strabo of Tyrrhene extraction, were living independent

when, about 530 B.C., they were attacked by the Carthaginians, and obliged, after a valiant but ineffectual resistance, to quit the low country and retire into their mountain fastnesses. During the first Punic War the Romans made strenuous exertions to become masters of the island, and ultimately, on agreeing to make peace, obtained a formal cession of it from the Carthaginians. This cession is mentioned by Livy as one of the causes which led to the second Punic War, in which Rome, though finally victorious, was brought to the brink of ruin by Hannibal. During the struggles between Rome and Carthage, Sardinia often became the theatre of war, and suffered equally from both the powerful states which contended for its possession. At a very early period the inhabitants were converted to Christianity. They passed successively into the hands of the Vandals, the Goths, the Longobards and Saracens. By the united efforts of the Genoese and Pisans the Saracens were ultimately expelled from the island, and then rival claims were set up for it by its liberators themselves. During the disputes that ensued some of the judges or governors succeeded in establishing themselves as independent princes. In 1297 Boniface VIII invested the kings of Aragon with Sardinia, and it continued in the possession of Spain till 1708, when it was taken possession of by the British. In 1713, in terms of the Peace of Utrecht, it was yielded to Austria. In 1720 it was ceded by Austria to Victor Amadeus II, Duke of Savoy, in exchange for Sicily. The Duke of Savoy thereafter assumed the title of king of Sardinia, which was finally exchanged in 1861 for that of king of Italy. Pop. 1,034,206.

SARDINIAN MONARCHY, a former south European kingdom, comprising Sardinia (q.v.) and its surrounding islands as the nucleate portion with several dependencies on the Italian mainland, which included the duchy of Savoy, whence came its kings; the principality of Piedmont; the county of Nice; the duchy of Genoa and parts of the duchies of Montferrat and Milan. These latter were divided for administrative purposes into 11 divisions — Turin, Genoa, Chambéry, Alessandria, Coni, Novara, Nice, Annecy, Ivrea, Savona and Vercelli. Previous to the annexation of its territories consequent on the events of 1859 (see ITALY), and the disjunction from it of the duchy of Savoy and the county of Nice, which, in the same year, were ceded to and now form part of France, comprised in the whole an extent of 28,229 square miles, with a population in 1858 of 5,194,807. A new constitution was voluntarily granted by Charles Albert in 1848, under which two legislative chambers were introduced, freedom of the press conceded and important reforms carried through. Catholicism was the religion of the state, but all other forms were tolerated. The last Sardinian king was Victor Emmanuel II, afterward king of Italy, who succeeded to the throne in 1849. The royal title was King of Sardinia, Cyprus and Jerusalem, and Duke of Savoy. The crown-prince was styled Prince of Piedmont.

History.— The country which formed the Sardinian states was known in ancient times in its southern part by the name of Liguria, and in its northern part, bounded on the north by the Pennine and on the west by the Graian and Cottian Alps, by the name of Gallia Cisalpina. Savoy, separated from the other parts, and lying beyond the Alps, was considered as belonging to Gallia Narbonensis. From this remote corner of the territory sprang the present royal house of Italy. In the middle of the 11th century, Humbert, Count of Maurienne, a great vassal of Rudolf III of Burgundy, appears exercising jurisdiction not only over Maurienne, but various other parts of Savoy, the Lower Valais and Aosta. This jurisdiction was extended to the banks of the Po by Humbert's son, Otho, who died in 1060, leaving two sons, who became successively counts of Savoy. Under Amadeus III a long series of changes followed, during which the house of Savoy was sometimes brought to the verge of destruction, and at other times attained to such prosperity as to excite the jealousies or fears of neighboring states. One of the counts, called Peter, ruled from 1263 to 1268. He added the canton of Vaud to his dominions, and in many ways improved the fortunes of his house. Henry III of England, who had married his sister, made him Earl of Richmond, and gave him for residence a palace on the banks of the Thames, which hence took the name of Savoy House. Among Peter's successors the most distinguished are Amadeus V, whose prosperous rule, from 1284 to 1323, procured him the title of Great. Amadeus VIII at the termination of his long reign of 49 years, in 1440, left his successor in possession of territories which gave him a distinguished place among the sovereigns of Europe. Being, however, interposed between France and Germany, they were often made the battlefield on which these great countries met to decide their quarrels. Notwithstanding this disadvantage, the house of Savoy, at the Peace of the Pyrenees in 1659, by which the wars of the French and Spanish monarchies were terminated, after they had raged for nearly 80 years, found itself under Charles Emmanuel II as great and prosperous as ever. He was succeeded in 1675 by Victor Amadeus II, during whose reign war between France and Germany again broke out. Amadeus became almost necessarily involved, but played his part so ably, that at the Peace of Utrecht in 1713 he not only added considerably to his continental possessions but obtained possession and was formally crowned king of Sicily. By a subsequent arrangement he exchanged Sicily for the Island of Sardinia, from which he and his successors took the title of king. On his death in 1730 he was succeeded by Emmanuel III, who became involved in the war of the Spanish Succession and saw his territories laid waste by contending armies. The Peace of Aix-la-

Chapelle compensated him by the addition of several important districts, and his own enlightened administration added greatly to the prosperity of his kingdom. He was succeeded in 1773 by his son Victor Amadeus III, who was succeeded in 1796 by his son Charles Emmanuel IV, who, after seeing his continental dominions overrun by the armies of the French, took refuge in the Island of Sardinia in 1799, and in 1802 abdicated in favor of his brother Victor Emmanuel I, who remained in Sardinia until 1814, when he again fixed the seat of government at Turin. Shortly after, the Congress of Vienna added Genoa to his territories. An insurrection led to his abdication in 1821 in favor of his brother, Charles Felix, whose reign of 10 years was marked by some important internal improvements. Having left no male issue, a collateral branch succeeded in 1831 in the person of Charles Albert, who promulgated the liberal constitution of 1848, the provisions of which are referred to above. The same year saw him at the head of a league intended to expel the Austrians from Italy. The disastrous results led to his abdication in March 1849, in favor of his son, Victor Emmanuel II, and very probably to his death in the following July. Under the government of Victor Emmanuel the cause of progress and liberal institutions steadily advanced, some of the more important of the reforming measures being the establishment of universal toleration in religious matters, the suppression, with a few exceptions, of the monastic houses, and an unfettered freedom accorded to the press in the discussion of political matters. Such a development of liberal principles naturally proved extremely distasteful to Austria, whose arbitrary sway, exercised over the adjoining provinces of Lombardy and Venice, presented so marked and glaring a contrast. Frequent aggressive attempts were made by her, and pretexts sought for provoking hostilities with Sardinia; but the flame only burst out finally in 1859, when, in the month of April of that year, the Sardinian territories were invaded by an Austrian army. The war which then ensued ultimately issued in the establishment of the kingdom of Italy, into which the Sardinian states were incorporated, with the exception of the Duchy of Savoy and County of Nice, which King Victor Emmanuel ceded to France. See also ITALY—HISTORY.

SARDIS, sär'dĭs (ancient SARDES, sär'dēz), ancient city, capital of Lydia, Asia Minor; on the site of the modern village of Sart, Turkey, 35 miles east-northeast of İzmir (Smyrna). It stood in the valley of the Hermus (now the Gediz) River, below Mount Tmolus (now Boz Dağ). It was a wealthy trading center on the routes between the Aegean Sea and the interior. Its strong citadel was destroyed by the Cimmerians in the 7th century B.C., but the town recovered and flourished, becoming the luxurious capital of the proverbially rich Croesus (r. 560–546 B.C.).

In 546 it was captured by Cyrus, the Persian king, who incorporated Lydia into his realm. The acropolis was burned in 510 B.C. by the Greeks, and it was in Sardis that Xerxes prepared his invasion of Greece (480). The city was taken by Antiochus III after a siege (215–213 B.C.). Under the Romans, Sardis prospered in spite of great destruction by earthquake in 17 A.D., but after the establishment of Constantinople (330 A.D.), the trade routes gradually moved away from it. In 1306 it was ceded to the Seljuk Turks, and in 1402 it was taken by Tamerlane, who presumably destroyed it, since it disappears from history. Excavations have been conducted at intervals since 1910. The ancient burying ground is of vast extent, and there are the remains of the tomb of Alyattes (d. 560 B.C.), the father of Croesus, and of the Temple of Artemis, Ionic in style.

SARDONYX, sär'dŏ-nĭks, a variety of the mineral quartz, in which layers of sard, each of even thickness, alternate with layers of white chalcedony. It was prized by the ancients for cameos, intaglios, seal rings, and engraved gems.

SARDOU, sär-dōō', **Victorien,** French dramatist: b. Paris, France, Sept. 7, 1831; d. there, Nov. 8, 1908. He was for a time a tutor of philosophy, mathematics, and history, but soon began his literary career by writing for reviews and encyclopedias. His first play, *La taverne des étudiants* failed at the Odéon in 1854, and for a time he abandoned the theater. But before long he was dramatizing again, and he won a popular success in almost every field of the drama except tragedy. He was elected a member of the academy in 1877. His books include *Les pattes de mouche* (1860); *Nos intimes* (1861); *Les diables noirs* (1863); *Séraphine* (1868); *Rabagas* (1872); *Daniel Rochat* (1880); *Divorçons* (1880); *Odette* (1881); *Fédora* (1882); *La Tosca* (1887); *Cléopâtre,* with Émile Moreau (1890); *Thermidor* (1891); *Madame Sans-Gêne,* with Moreau (1893); *Gismonda* (1894); *Spiritisme* (1897); *Robespierre* (1899); *La sorcière* (1903).

In his comedy, Sardou revealed rapid movement, witty dialogue, frequently clever satire on contemporary matters, but unconvincing character portraiture, loose construction and improbable episodes. His "historical" dramas aimed at the heroic, but were simply grandiose.

SAREMA, sä'ryĭ-mä (German OESEL, û'zĕl), island, USSR, at the mouth of the Gulf of Riga, 13 miles off the Estonian coast. It is part of Saare Province of Estonia, and its chief town and port, Kuressare (Ger. Arensburg) on the southern coast, is the provincial capital. The island is 55 miles long and 25 miles wide, ending on the southwestern side in Sorve Peninsula, 20 miles long. The chief activities are dairy farming, the raising of hogs and sheep, the growing of potatoes and small grains, and fishing.

Sarema was conquered by the Teutonic Knights in 1227, and was governed by its own bishops until 1561, when it went to Denmark. The latter relinquished it to Sweden in 1645, and in 1721 it went to Russia as part of Livonia. Sarema became part of Estonia in 1918. During World War I, it was captured by the Germans in 1918, and was again occupied by them from 1941 to 1945 during World War II. Area 1,010 square miles. Pop. about 50,000.

SARGASSUM, sär-găs'ŭm, the most highly organized genus of the marine algae, Fucaceae, or rock weeds. They are seaweeds which are either attached to stones by a discoid hold-fast or are floating, with long filiform stems, much branched and bearing long, narrow, leaflike fronds with distinct midribs. The air bladders are little, stalked globes, with slender project-

ing tips, and stand out from the axils of the fronds, like solitary grapes. It is to this characteristic that the generic name remotely refers and which has given rise to the common names, tropical grapes and grape-weed. Sargasso stems are much employed in South America under the name of goitre-sticks, for the cure of goitre. *Sargassum bacciferum* is the famous gulf-weed, which forms rafts or islands floating together on vast areas of the various oceans and called «sargasso seas.» The one lying in the North Atlantic Ocean, between the Azores and the Antilles (roughly 20° to 38° north latitude and 30° to 65° west longitude), its exact position being determined by the central whirl of the Gulf Stream, is so dense as to be often a hindrance to navigation. It covers a territory nearly equal to the European continent and was discovered by Columbus on his first voyage, he and the succeeding Spanish navigators calling it the Mar de Sargaço; it is connected by a narrow belt with a smaller sea between the Bermudas and the Bahamas. There is still another sea in the Pacific and one in the Antarctic Ocean. It is a disputed question whether the weeds have been torn from the shore and blown to their final resting place or whether they live and propagate themselves on the high seas. At any rate these floating islands furnish a permanent home to many small pelagic animals and of predaceous animals seeking them as food.

SARGENT, Dudley Allen, American educator and lecturer: b. Belfast, Me., 28 Sept. 1849; d. Peterboro, N. H., 21 July 1924. In 1875 he was graduated at Bowdoin College and in 1878 received the degree of M.D. at Yale University. From 1879 he was director of the Hemenway Gymnasium at Harvard University and from 1879 to 1889 was assistant professor of physical training at Harvard. In 1881–1916 he was director of the Normal School of Physical Training at Cambridge, Mass., and after 1916 was president of its successor — the Sargent School for Physical Education. In 1907–16, Dr. Sargent was president of the Health Education League. He is the inventor of modern gymnasium apparatus, of the Sargent Anthropometric charts, and published 'Universal Tests for Strength, Speed and Endurance' (1902); 'Health, Strength and Power' (1904); 'Physical Education' (1906); also numerous articles and papers on physical education.

SARGENT, Epes, American poet and dramatist: b. Gloucester, Mass., 27 Sept. 1813; d. Boston, Mass., 31 Dec. 1880. He was educated at Harvard, was for a time connected with newspapers in Boston and New York, and in 1836 began writing for the stage. His plays include the 'Bride of Genoa'; 'Change makes Change'; 'Velasco,' and 'The Priestess.' He published 'Songs of the Sea' (1847); 'Poems' (1858); 'The Woman who Dared' (1869); his most noted lyric being 'A Life on the Ocean Wave.' His novels include 'Wealth and Worth' (1840); 'What's to be Done' (1841); 'Fleetwood' (1845); 'Peculiar: A Tale of the Great Transition' (1863). Still other works are 'Life of Henry Clay' (1843); 'American Adventure by Land and Sea' (1847); 'The Critic Criticised' (1856); 'Arctic Adventures by Sea and Land' (1857); 'Original Dialogues' (1861); and posthumously 'Cyclopædia of English and American Poetry' (1883).

SARGENT, Frank Pierce, American labor leader and government official: b. East Orange, Vt., 18 Nov. 1854; d. 1908. He was engaged in various occupations until 1880, when he became fireman on the Southern Pacific Railroad. He was chief of the Brotherhood of Locomotive Firemen in 1885–1902 and was prominent in the strikes of 1892–94. He gained the reputation of a forceful leader for the firemen, and at the same time was notable for his moderation and reasonable methods of dealing with employers. He was offered appointments as member of the Industrial Commission and as director of the Bureau of Printing and Engraving by President McKinley, but declined because of his desire to remain with the brotherhood. In 1902, however, he accepted President Roosevelt's appointment of him as Commissioner-General of Immigration, an office he occupied until his death.

SARGENT, Henry, American artist and soldier: b. Gloucester, Mass., 25 Nov. 1770; d. Boston, Mass., 21 Feb. 1845. He studied art in England in 1793–97. In 1799 he entered the United States army, was aide-de-camp to the governor of Massachusetts with rank as colonel in the War of 1812, and later adjutant-general. He served two terms in the legislature and afterward resumed his profession. His first painting was 'The Landing of the Pilgrims.' His other paintings include 'Christ Entering into Jerusalem'; 'The Starved Apothecary'; 'The Tailor's News'; 'The Dinner Party'; a full length portrait of Peter Faneuil, in Faneuil Hall, Boston, etc.

SARGENT, Herbert Howland, American soldier and military historian: b. Carlinville, Ill., 29 Sept. 1858. He was graduated at Blackburn University, 1878, and at the United States Military Academy in 1883. He was commissioned second lieutenant, Second Cavalry, 13 June 1883; first lieutenant, 19 June 1890; captain, 2 March 1899; major, 8 Jan. 1909. He served as professor of military science at the University of Illinois, 1886–87, and served on frontier. At the outbreak of the Spanish-American War he was ordered to Washington to help organize volunteer forces and was colonel of the Fifth United States Volunteer Infantry, 20 May 1898–31 May 1899. He served at Santiago and Guantánamo, Cuba, under Gen. Leonard Wood, and as lieutenant-colonel of the 29th United States Volunteer Infantry 5 July 1899 to 10 May 1901. He fought insurgents in the Philippines and commanded attacking forces 19 Dec. 1899 at the battle of San Mateo in which Major-General Lawton was killed. He was professor of military science and tactics at the Agricultural and Mechanical College of Texas, 1903–07, and graduated at the Army War College in 1909. He retired November 1911. On 27 June 1917 he was recalled to active duty, serving until 25 Sept. 1917, after which he was professor of military science and tactics at Princeton University. He published 'Napoleon Bonaparte's First Campaign' (1893); 'The Campaign of Marengo' (1897); 'The Campaign of Santiago de Cuba' (1907). He died, 16 Sept. 1921.

SARGENT, John Garibaldi, Attorney General of the United States: b. Ludlow, Vt., 13 Oct. 1860. After graduating from Tufts College in 1887 he studied law and was admitted to

the bar in 1890. He was State's Attorney for Windsor County, Vt., from 1898 to 1900, and from 1900 to 1902 was Secretary of Civil and Military Affairs of Vermont. He served as Attorney General of the State from 1908 to 1912, and from that year until 1925 was engaged in private practice in Vermont. In the latter year he was appointed by President Coolidge Attorney General of the United States, and served until 1929. He received honorary degrees from several universities and colleges, and served on important commissions. Died 5 March 1939.

SARGENT John Singer, American painter: b. Florence, Italy, 1856; d. London, England, 14 April 1925. He was educated in Italy, France and Germany, and received his early art training under Carolus Duran. He was elected member of the Royal Academy of England in 1891 and of the National Academy of Design, New York, in 1897. He lived abroad all his life and never spent more than a year in the country of his parents. Having had the advantage of being chosen by Carolus Duran as an assistant in the execution of important government commissions, he thoroughly mastered the secrets of French technique before adopting a method and style which are purely his own. His chief works are in portrait and genre. Among his portraits may be mentioned that of 'Carolus Duran'; 'General Leonard Wood'; 'Mr. Joseph Jefferson'; 'Major Francis Lee Higginson'; 'Homer St. Gaudens'; 'President Roosevelt'; 'Henry G. Marquand'; 'William M. Chase'; 'Carmencita'; 'Ada Rehan.' His genres include 'Fishing for Oysters at Cancale'; 'Neopolitan Children Bathing'; 'El Jaleo.' His most ambitious and original works, however, are the decorations in the Boston Library. As a painter his manner was French in brilliant versatility and epigram, but his treatment infinitely superior to the millinery effects of Duran and his school. His portraits reflect clearly the characteristics of his sitter and his intuition is unerring in detecting the subtilest traits of individuality. As a specimen of his wall-painting we may cite that portion of the Boston Library decorations known as the 'Dogma of the Redemption.' It is divided into an upper and a lower panel which would seem to represent Heaven and Earth severally. In the upper panel are the three persons of the Trinity enthroned, with hands raised in blessing, the Father wearing the triple crown, or tiara; each enrobed in a flowing, cope-like garment. In the centre of this picture is set up the cross on which Christ is suffering, while Adam and Eve catch in chalices of gold the blood that drips from his hands. Below the foot of the cross is the pelican, symbol of self-sacrificing love. Above the arms of the cross runs the inscription *Remissa sunt peccata mundi* ("The sins of the world have been remitted"). Across the molding which separates the two divisions of the subject is a monkish distich.

Factus homo factor hominis, factique redemptor,
Redimo, corporeus corpora, corda deus.
(I, man's maker, now made man, and redeemer of him I made, God in flesh, redeem all human hearts and bodies.)

In the lower panel are angels bearing the instruments of the passion, namely, the reed, the nails, the spear, the pillar of scourging and the scourge, the crown of thorns and the ladder. The work has all the pomp and dignity of Byzantine conventionalism, and for richness of color and splendor of arrangement is one of the most impressive of this magnificent series. It is deeply devotional in tone and must be looked upon as among the finest Christian painting of the period. In 1910 Sargent practically abandoned portraiture for landscapes and genre subjects. Among his later oil paintings are 'The Weavers' (1913); 'Cypresses and Pines' and 'The Courtyard' (1914). A notable exhibition of his water-color drawings was held in London and New York in 1912, from which the Boston Museum acquired 45 and the Brooklyn Museum 83 examples.

SARGENT, Winthrop, American soldier and Territorial governor: b. Gloucester, Mass., 1 May 1753; d. New Orleans, La., 3 June 1820. He was graduated at Harvard in 1771 and in 1775 entered the Revolutionary army, serving through the war and attaining rank of major. He was interested in the development of the West, became associated with the Ohio Land Company in 1786 and was soon afterward appointed surveyor-general of the Northwest Territory. In 1787 he became its secretary and in 1798–1801 he was governor of the Territory. He served in the Indian Wars of 1791 and 1794–95. He was a member of the American Academy of Arts and Sciences. Author of 'Papers Relating to Certain American Antiquities' (1796); 'Boston,' a poem (1803).

SARGENT, Winthrop, American lawyer and author, grandson of the preceding: b. Philadelphia, Pa., 23 Sept. 1825; d. Paris, France, 18 May 1870. He was graduated at the University of Pennsylvania in 1845 and at the Harvard Law School in 1847, practised law for a short time in Philadelphia and later settled in New York. He was well known in the periodical press as a writer on history and genealogy. Author of 'History of an Expedition against Fort Duquesne in 1775, under Major-General Braddock' (1855); 'The Loyalist Party of the Revolution' (1857); 'Life and Career of Major John André' (1861); 'Les États Confédérés et de l'esclavage' (1864), etc.

SARGON, sär'gŏn, a king of Assyria, successor of Shalmaneser, reigned from 722 to 705 B.C. See ASSYRIA.

SARK, särk, the "Pearl of the Channel Islands," situated seven miles east of Guernsey and 13 miles northwest of Jersey, is about three and one-half miles in length and one and one-half in extreme breadth. It is surrounded by inaccessible rocks, the chief landing-place, Creux (hole) Harbor, being on the east coast, where a cave has been enlarged and tunneled through the cliff to give access to the interior. The island consists of two portions, Great Sark and Little Sark, connected by a high and rocky isthmus, called the Coupée, narrowing to the width of only a few feet. On the west is the small islet of Brecqhou. Sark is annually visited by several thousand tourists owing to its interesting and picturesque scenery and numerous romantic caves. The inhabitants are chiefly engaged in fishing and agriculture. Sark is administered as a dependency of Guernsey.

SARMATIA, sär-mā'shĭ-a, a name given by the Romans to the country between the Vistula and the Caspian Sea and corresponding

largely to central and southern Russia. The Sarmatian people, of Aryan stock, were excellent horsemen and fierce warriors. By the 4th century A.D. they had been dispersed by pressure from the Romans, the Germans, and the Huns.

SARMIENTO, sär-myān'tō, **Domingo Faustino,** Argentine statesman and writer: b. San Juan, Argentina, Feb. 15, 1811; d. Asunción, Paraguay, Sept. 11, 1888. In 1829 he fought in the insurrection against the Gaucho dictator Juan Manuel Ortiz de Rosas and was exiled in 1835 to Chile, where he established a brilliant career as a literary figure, educator, and political thinker. His most famous book, *Facundo* (1845), ostensibly a biography of a political enemy, presents Sarmiento's enlightened and progressive political philosophy. In 1852, after Rosas' defeat, Sarmiento returned to Argentina and a political career. He was minister to the United States from 1864 to 1868 and president of Argentina from 1868 to 1874, giving the country one of its most successful and progressive administrations. From 1875 to 1888 he reorganized Argentina's school system. Sarmiento's extensive writings, largely devoted to educational theory, have appeared in a collected edition (52 vols., 1885–1903).

Consult Grummon, Stuart E., tr., *A Sarmiento Anthology* (Princeton 1948); Bunkley, Allison W., *The Life of Sarmiento* (Princeton 1952).

SARMIENTO DE GAMBOA, thä gämbō'ä, **Pedro,** Spanish mariner: b. Galicia, Spain, about 1530; d. there, about 1592. Long active on the Peruvian coast, he was ordered in 1579 to take possession of the Straits of Magellan for the purpose of intercepting Francis Drake, then engaged in his depredations off the coasts of Peru and Mexico. Drake, however, evaded him. In 1581 Sarmiento was sent again to fortify the Straits, holding joint command of the expedition with Diego Flores Valdés. Flores, however, deserted him, leaving him with only four vessels. In 1583 Sarmiento founded San Felipe (Port Famine), garrisoned it with 300 men, and in 1584 sailed for Europe. He was captured en route by the English and held prisoner until 1588. His colony lost all but two of its men by starvation. Sarmiento wrote a narrative of his voyages and a short history of the Incas, which have been translated into English.

SARNIA, sär'nĭ-ä, city, Ontario, Canada, seat of Lambton County on the St. Clair River a short distance below the point at which the river leaves Lake Huron, directly opposite Port Huron, Mich., and 170 miles west of Toronto. The city is connected with Port Huron by frequent ferry service, by the large Blue Water International Bridge, and by the famous St. Clair Tunnel (two and one-quarter miles long) of the Canadian National Railway. For over a century the port has played an important part in the transshipment of grain and lumber on the Great Lakes and as a steamboat passenger and freight terminal. The bay provides over three miles of still-water harbor frontage for vessels of up to 24-foot draft. There are large government warehouses and a Canadian National Railway grain elevator of three million bushels' capacity. In 1950 some 650 vessels arrived in the coasting trade and 530 in the foreign service. Unloadings from the latter were chiefly of coal and crude petroleum. Exports were chiefly of sand and gravel from the vicinity.

Sarnia has been notable in recent years for the rapid expansion of its industrial output. The Imperial Oil Company has erected the largest petroleum refinery in the British Commonwealth here and Dow Chemicals of Canada has also constructed large works. Other important manufactures include Fiberglas, steel and brass products, farm implements, synthetic rubber, salt, and flour. There is a large summer holiday trade with the nearby Lake Huron beaches. Pop. (1941) 18,734; (1951) 34,697.

SARONIC GULF, sä-rŏn'ĭk, or **GULF OF AEGINA,** ē-jī'nä, inlet of the Aegean Sea, 50 miles long and 30 miles wide, central Greece, separating Attica on the northeast from Peloponnesus on the southwest. It is connected by the Corinth Canal with the Gulf of Corinth. The main port is Piraeus, which serves adjacent Athens. Anciently the gulf was known as Sinus Saronicus.

SAROS, sā'rŏs, an astronomical cycle of 18 years, 11⅓ days, or 223 lunations, in which almost identical eclipses of the sun and moon are periodically repeated. The period of the saros is thought to have been calculated originally by the Chaldeans.

SAROYAN, sä-rō'yän, **William,** American author and playwright: b. Fresno, Calif., Aug. 31, 1908. Son of Armenian immigrants of the sort that he often pictures with affection in his work, he first gained recognition with his bitterly humorous *The Daring Young Man on the Flying Trapeze* (1934). This note, often autobiographical, continues in his numerous works. From 1939, when he produced his first play, *My Heart's in the Highlands,* he turned much of his energies into writing for the stage. His one popularly successful drama was the whimsical *The Time of Your Life* (1939), for which he was awarded, but declined, the Pulitzer Prize. This play was made into a film, as was his sentimental wartime novel, *The Human Comedy* (1942). Saroyan's recent publications include *The Bicycle Rider in Beverly Hills* (autobiographical, 1952) and *The Laughing Matter* (1953).

SARPEDON, sär-pē'dŏn, a hero in Homer's *Iliad,* slain by Patroclus in the siege of Troy. Greek mythology represents his grandfather of the same name as the son of Zeus and Europa and the founder of a kingdom in Lycia, Asia Minor.

SARPI, sär'pē, **Paolo** (called also Fra Paolo; Paulus Servita), Italian historian and statesman: b. Venice, Italy, Aug. 14, 1552; d. there, Jan. 15, 1623. Though he was a prominent member of the Servite Order, which he served as procurator general during 1585–1588, his intercourse with Protestant leaders brought upon him the imputation of heresy. In a dispute between Pope Paul V and Venice (1606) on the question of ecclesiastical authority Sarpi was a strenuous advocate of Venice and was summoned to Rome to answer for his conduct, but the affair was compromised. His ecclesiastical enemies attempted his assassination in 1607. Sarpi's chief literary work was his history of the Council of Trent, a work which now is accounted

untrustworthy on account of its extreme and evident partisanship. His labors extended to diverse branches of knowledge; he was skilled in the canon law, and was also distinguished for his acquaintance with anatomy. He appears to have discovered the valves of the veins which facilitate the circulation of the blood. His 'Istoria del Concilio Tridentino' was first published in London in 1619, having been transmitted to that country through the medium of the British resident at Venice, Sir Henry Wotton, a personal friend of the author. This work is strongly anti-papal, nay, even rationalistic in tone and was answered by a voluminous work on the same subject by the Jesuit Pallavicino. The works of Father Paul were printed at Verona 1761 (8 vols.) and at Naples 1790 (24 vols.). His life has been written in Italian by Bianchi-Giovini (1836), and in English by A. Robertson (1894). Consult also *Atlantic Monthly* (January and February 1904); Trollope, T. A., 'Paul the Pope and Paul the Friar' (1860).

SARRACENIA, sär-ą-sē'nĭ-ą, a genus of carnivorous plants, of about eight species, growing in bogs in eastern North America and named in honor of Dr. J. A. Sarracin. They have peculiar large nodding flowers solitary on their scapes. The five sepals are bracted at the base and the five fiddle-shaped petals are purple, brown or yellow and hang about a style which is dilated at the apex until it resembles an inverted umbrella, with five rays, terminating in hooked stigmas under the angles. The anthers are grouped about the base of the styles. The three- to five-celled ovary becomes a colored capsule in fruit. The name «side-saddle flower» has been given because of its resemblance to a pillion. The origin of the other vernacular names — pitcher plant, trumpet leaf or huntsman's horn — is very evident, for the leaves are hollow and with a lid more or less erect.

These leaves are dispersed in rosettes and are very curiously adapted, in the several species, for entrapping and digesting insects. The most common species is *Sarracenia purpurea,* which has tubular leaves, inflated at the middle and contracted at the orifice, where a heart-shaped wing, curved somewhat like a scoop, joins the hollow leaf. Another ribbon-like wing, starting from the base of the leaf, extends along the concave surface of the tube to the orifice. The whole pitcher-like leaf is green, veined with reddish purple. The scoop-like wing at the summit of the leaf catches rain-water and deflects it into the pitcher, which is often half-filled. The inside of the scoop is lined with glandular hairs which secrete honey, and the whole inner surface of the pitcher is lined with stiff spinous bristles, slippery and pointing downward, and the nearer the base the longer the points become. The reason for this apparatus appears when insects are attracted to the Sarracenia by the honey secreted in the hood-like wing. Some fly to it, some crawl up from the ground, helping themselves to climb by the longitudinal wing. Once there they feed on the honey, but if they carelessly stray from the wing to the orifice, where the slippery bristles begin, they promptly fall into the water collected in the pitcher. In spite of their struggles they can never crawl up past the relentless chevaux-de-frise of glassy, down-pointed teeth, and ultimately drown in the liquid. So many sometimes meet this tragic death that the putrid odor arising from the pitcher is offensive. Just what happens to the decaying bodies does not seem to be certain. Other carnivorous plants digest their victims with acid secretions and pepsin, and insects seem to be macerated in the *Sarracenia purpurea* pitchers more quickly than by ordinary rain-water, yet it is believed that the plants profit mainly by the liquid manure obtained. Consult Darwin, 'Insectivorous Plants' (new ed., New York 1900).

SARRAIL, Maurice, French general: b. 1856. In 1913 he commanded a division of the Sixth Army Corps at Rheims and at the opening of the war was sent to command at the Argonne. With Dubail he protected the French right flank against attacks from Thionville and Metz. He splendidly organized the defense of Verdun, holding it against the rush of the Germans in August and September 1914. Much of the strategy in the retreat to the Marne was given to his execution. About the middle of the year 1915 he was withdrawn from command but was appointed commander-in-chief of the Army of the Orient in August to succeed Gouraud. He made Saloniki, Greece, his headquarters and with his forces which were a mixture of troops of the most heterogeneous nature (British, Italian, Greek, African, etc.), he captured Monastir in December 1915. He was recalled December 1917. In 1918 he was placed on the reserve list. He wrote 'My Command in the Orient.' He died 23 March 1929.

SARSAPARILLA, an alterative drug obtained from the roots of a species of *Smilax,* indigenous to Central and South America. The drug-yielding species of this genus, to which the American cat-briers belong, are not very exactly identified, although sarsaparilla has been known to Europeans since 1536–45, and was extensively used soon afterward. *Smilax officinalis, S. medica* and *S. papyracea* are believed to be the principal sources of supply of sarsaparilla. They are tough, twining shrubs with square or round prickly stems, small flowers and generally shining leaves. Sarsaparilla plants were somewhat cultivated in Jamaica, but are chiefly obtained by trade with the aborigines of the countries where they grow. The drug itself is extracted from the horizontally creeping roots of the *Smilax,* which radiate from the stems, and are so long that it takes an Indian many hours to disentangle them from the soil and other roots. They are then dried and wrapped for transportation. The form of the original package in which the roots reach the pharmacist is an indication of the market from which it is sent, and the country from which it is exported furnishes the commercial name of the drug. Thus, Rio Negro, otherwise known as Para or Lisbon sarsaparilla, is always exported in cylindrical bundles, about three and one-half feet long and five or six inches in diameter, composed of finely wrinkled roots, brown with adhering earth, cut square and even at both ends, and wound closely with the stems of Pothos. Jamaica sarsaparilla (a name which formerly included many other varieties, now differentiated) is sent out loosely. Sarsaparillas are classed as mealy or non-mealy sarsaparillas, according to the amount of starch

granules in the parenchyma, a condition which seems to depend upon locality, and they differ in the color of their barks and in microscopical characters.

SARSFIELD, Patrick, Earl of Lucan, Irish Jacobite: b. Ireland, about 1645; d. Netherlands, Aug. 19, 1693. Commissioned colonel in 1686 he was a strong supporter of the cause of James II in Ireland, by whom he was created Earl of Lucan. He drove the English out of Sligo, fought at every important engagement of the war and had charge of the defense of Limerick. When that city capitulated in 1691, he crossed over to France where James gave him command of the Irish troops in the intended invasion of England the following year. He was mortally wounded at Neerwinden in the battle of Landen, Aug. 19, 1692.

SARSI, sär'sē, **INDIANS,** also Sarcee, Sarsee, Sussee, from a Blackfoot word said to signify "not good." Their own name is Sotemia. A tribe of the Montagnais division of the Athabascan stock of North American Indians, fewer than 200 survive in the Sarcee agency at Calgary, Canada.

SARTAIN, Emily, American artist: b. Philadelphia, March 17, 1841; d. there June 18, 1927. She was a daughter of John Sartain (q.v.), under whom she studied and worked at engraving, afterward studying (1864–70) at the Pennsylvania Academy of Fine Arts, then in Italy, and still later (1871–75), under Luminais, in Paris. She excelled in mezzotint engraving, in etching and in portrait painting; accomplished much in book illustration and the etching of framing prints, and in genre work also distinguished herself. She received a medal at the Centennial Exhibition in 1876, and the Mary Smith prize at the Pennsylvania Academy in 1881 and 1883.

SARTAIN, John, English-American engraver and editor: b. London, Oct. 24, 1808; d. Philadelphia, Oct. 25, 1897. He came to the United States in 1830, settled in Philadelphia and introduced in this country mezzotint, which he had begun two years earlier to practice. He also practiced miniature painting on vellum and ivory and portrait painting in oil. He was the designer of several public monuments, of which the best known is that to Washington and Lafayette in Philadelphia. He was also editor of the *Foreign Semi-monthly Magazine* and of the *Union Magazine,* which he renamed *Sartain's Union Magazine.* Among his more important engravings are *Christ Rejected* (1862), after Benjamin West; *The Ironworker and King Solomon* (1876), after Christian Schussele, and the *Battle of Gettysburg,* after Rothermel.

SARTAIN, William, American landscape, genre and portrait painter: b. Philadelphia, Nov. 21, 1843; d. New York, Oct. 25, 1924. After graduation from college he engraved for three or four years, then studied under Schussele and at the Pennsylvania Academy of Fine Arts. He then went to Paris and studied seven years under Bonnāt and at the École des Beaux Arts. He traveled in Spain, Italy and Algiers, and after exhibiting in London (1875) and New York Academy (1876) returned to America, settling in New York. He was one of the original founders of the Society of American Artists and was for some years professor of the life class of the Art Students' League, New York.

SARTO, Andrea Del, noted Italian painter: b. near Florence, July 6, 1486; d. Florence, Jan. 22, 1531. He was the son of a tailor (*sarto*). Authorities disagree as to whether Andrea's surname was Vanucchi or di Francesco; however, the nickname alluding to his father's trade by which he was known during his lifetime has been used ever since. In 1494 he was apprenticed to a goldsmith; disliking the craft, he soon changed his occupation, finding employment with Gian Barile, a skilled woodcarver but talentless painter. In 1498 the prentice boy again changed masters and, under Piero di Cosimo's direction, studied the cartoons of Michelangelo and da Vinci. Several years later he entered into a brief partnership with an older friend Franciabigio. Probably their first commission was a *Baptism of Christ,* in monochrome chiaroscuro, which initiated a series for the Florentine Compagnia dello Scalzo. In 1509 the Servite brotherhood employed him to paint five frescoes illustrating the life of their patron saint, Filippo Benizzi; these gained him his first renown and the title of *Andrea senza errori* (Andrew the unerring). Before the end of 1510, when Michelangelo's Sistine frescoes were still unfinished, the young artist was already regarded as rivaling Raphael. He continued working for the Servites until 1514, and on subsequent occasions executed individual commissions for them. In 1525 he painted for the cloister of their church of San Annunziata a lunette, the *Madonna del Sacco,* generally considered his masterpiece. Another famous fresco is the *Last Supper* in the church of S. Salvi near Florence. He stayed in Florence throughout the siege of 1529, but succumbed to the pestilence that followed, and was buried in the church of the Servites. Though his fame rests chiefly on his achievement as a fresco painter, his easel paintings (portraits as well as religious subjects) are valued by collectors and displayed in the principal American and European galleries. Vasari, who was one of his pupils, is the chief contemporary authority. Notices of him appear in all Italian art manuals, and there are biographies by American, English and Continental writers.

SARTO, Giuseppe. See Pius X.

SARTOR RESARTUS. Among autobiographies, *Sartor Resartus* ("the tailor patched") remains unique. It was built up out of Carlyle's thinking and his experience of life during his first happy married years at Craigenputtoch. It is a thickly veiled autobiography. Thomas Carlyle appears in a mask as Diogenes Teufelsdröchk, professor of things in general in the German university of Weissnichtwo. The second book deals with the advent, education, love affair and spiritual development of this remarkable professor. This is the most easily understood portion of the book and contains the most famous passages, such as the noble chapter, "Natural Supernaturalism." The first and third books profess to give translated excerpts from this imaginary professor's imaginary treatise on clothes, with comments and explanations by the "English editor." These

are Carlyle's radical opinions set forth, not in a complete system, but as fragments of a philosophy.

Most undeservedly *Sartor* has the reputation of being in prose what *Sordello* is in verse. The varied, impassioned, richly allusive style is supposed to be "German," and the matter to be beyond ordinary human comprehension. This widespread misconception is due to the fact that *Sartor* appeared at a time when "German" was a synonym for "mysterious." Carlyle learned his peculiar style in his father's house before he knew a word of German. There is difficulty in grasping Carlyle's unusual ideas, because they are unusual, not because they are presented feebly or obscurely. The narrative portions offer no difficulties. "It is a work of genius, dear," was Mrs. Carlyle's criticism; and the world has come to agree with this verdict.

The spiritual experience delineated in the second book is typical. Teufelsdröckh at the nameless university loses the simple creed of childhood and passes into doubt, denial, unbelief. He is in consequence utterly miserable. From this stage in his spiritual progress he passes, by way of the "Centre of Indifference" to "The Everlasting Yea," or positive working philosophy. The main ideas of renunciation, duty, work are derived from Goethe, whom Carlyle reverenced.

America welcomed *Sartor* before the writer's own country. Thanks to Emerson, an American publisher had the honor of producing the *editio princeps*. America also led in appreciation. The philosophy of *Sartor* had no little share in bringing on the Transcendental movement in New England. It exerted a great influence over Carlyle's contemporaries. Such leaders of thought as Emerson, Huxley, John Tyndall, John Ruskin and Charles Kingsley confess their debt. An edition of 30,000 copies sold before Carlyle's death. The first critical edition of the text with full notes and introduction by Archibald MacMechan appeared in 1896.

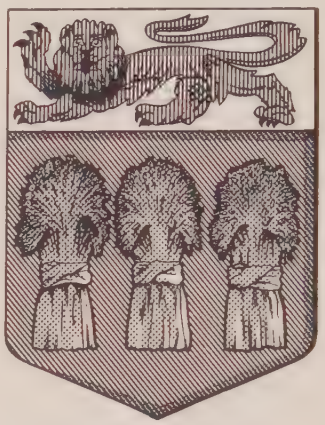
ARCHIBALD MACMECHAN.

SARTORIUS, sär-tō′rĭ-ŭs, the tailor's muscle (from the Latin *sartor,* a patcher, tailor), a muscle of the thigh which is attached at one end to the edge of the anterior, superior, spinous process of the ilium or chief bone of the pelvis, and at the other to the superior, anterior, and internal part of the tibia. It takes its name from the fact that it is by the contraction of the two sartorius muscles that the legs are crossed in sitting in the manner of tailors.

SARTS, a name given to the settled inhabitants, whether agriculturists or traders, as distinguished from the nomad inhabitants of Turkistan, Afghanistan, Iran, and the adjacent regions of Asia. Strictly speaking, the name has no ethnological significance.

SASEBO, sä-sĕ-bô, seaport, Japan, in Nagasaki Prefecture, Kyushu, near the mouth of Omura Bay. An important naval base since 1886, it was heavily bombed by United States forces in World War II. Pop. (1947) 175,233.

SASKATCHEWAN, săs-kăch′ĕ-wŏn, a Canadian province at the northern edge of the Great Plains region of North America, deriving its name from the river Saskatchewan (Cree Indian, meaning "swift flowing"), whose northern and southern branches unite within its borders. Bounded on the east by Manitoba, on the west by Alberta, on the north by the Northwest Territories, and on the south by North Dakota and Montana, Saskatchewan comprises an area of 251,700 square miles. Its northern and southern boundaries are 277 and 393 miles long respectively, and the distance between them is 761 miles. Less than half of the province is predominantly agricultural, but it is here that the capital (Regina) and the other cities (Saskatoon, Prince Albert, Moose Jaw, Swift Current, Weyburn, North Battleford, and Yorkton) are located. Wheat is the most important item in the economy; hence the unofficial title, "the wheat province."



Arms, Province of Saskatchewan.

PHYSICAL CHARACTERISTICS

Topography.—Although large areas of Saskatchewan are comparatively level, altitudes vary from 697 feet at Lake Athabaska in the far north to 4,546 feet in the Cypress Hills in the extreme southwest. In general the province slopes eastward and to the north: the largest portion belongs to the Hudson Bay drainage basin, while in the northwest drainage is towards the Arctic Ocean; in a small area in the southwest the streams flow

Lines of trees form windbreaks around farms near Riceton, southeast of Regina.

towards the Missouri. Saskatchewan contains large parts of the second and third prairie levels, separated by an escarpment known as the Missouri Coteau; the average altitude of the former is 1,600 feet, of the latter 2,000 to 2,500 feet. The chief rivers are the North and South Saskatchewan, the Churchill, the Qu'Appelle, and the Assiniboine, all part of the Hudson Bay drainage system. In the northern half of the province there are countless lakes, of which the largest are Athabaska (2,165 square miles in Saskatchewan), Reindeer (2,444), Wollaston (768), la Ronge (450), Cree (350), and Peter Pond (302). About one third of Saskatchewan lies within the pre-Cambrian shield region, a land of rock, water, and stunted forest, with tundra in the far northeast corner. South of this is a wide belt of mixed forest, which in turn gives way to another belt of tall grass and poplar groves (park land); south of this again and extending to the international boundary is the grass-covered open plain. The glaciers left their mark throughout the province by scouring the pre-Cambrian rocks and leaving thick deposits over the Cretaceous sandstones of the southern half. The heavy, level clay lands of the Regina and Rosetown districts mark the location of large glacial lakes. A significant geological feature of the southern border area are the deposits of the Tertiary period containing lignite coal formations. The top soils lie in broad belts running diagonally northwest across the southern half of the province and ranging from light brown, through dark brown, black, and grey in the forest belt.

Climate.—The climate of Saskatchewan is continental in type, with marked variations between summer and winter and day and night temperatures. In the far north the July average is 58°F. and in the south 65°F. The January averages are —18°F. and —1°F. respectively. The frost-free period in the southern half of the province varies from 110 to 125 days. Rainfall ranges from 11 to 15 inches in the open plains, and tends to be irregular; the park land and forest belt receive 15 inches or more, and with greater regularity. Farther north precipitation decreases, but there is less evaporation.

Flora and Fauna.—Travelers of the pre-settlement era make frequent reference to the flowers which carpeted the open plains in the summer, but much of the original grassland vegetation has disappeared with the spread of cultivation; on the other hand the virtual elimination of prairie fires has favored the spread of poplar, willow, and alder "bluffs" in park land areas. The forest species are those common to all northern Canada, but are less numerous than in eastern Canada, especially the deciduous varieties. Spruce, jack pine, balsam, tamarack, birch, and poplar are present in significant quantities. The tundra of the extreme northeast is largely treeless, but abounds in arctic grasses, shrubs, mosses, and lichens.

The province has rich and varied wild life resources. Buffalo now exist only in parks, but other big game animals—deer, antelope, elk, moose, and caribou—are flourishing as a result of conservation measures. Beaver and muskrat trapping is carefully controlled, and these fur bearers have increased greatly. Other animals of the province include the rabbit, gopher, coyote, weasel, mink, fox, squirrel, black bear, skunk, and lynx. For commercial and sporting purposes the most important fish are whitefish, trout, pickerel, pike, tullibee, mullets, and sturgeon. Game birds (especially waterfowl) are in bounteous supply throughout the province, and include ducks (in many varieties), Canada geese, prairie chicken, Hungarian partridge, pheasants, and ruffed grouse.

THE PEOPLE

Population and Ethnic Groups.—The population of Saskatchewan in 1953 was estimated to be 861,000 (1951 census, 831,728). The peak was reached in 1936 (931,547), followed by more than a decade of decline due to the effects of depression, war, and employment opportunities in more industrialized areas. Economic developments of recent years have reversed this downward trend, and there has also been a marked increase in urban population, while the farm population has declined sharply due to the increasing size of farm units. The rural population (farm residents and villages under 1,000) is still the dominant factor: 579,258 in 1951. Saskatchewan's population is unique in that it has the lowest percentage of persons of Anglo-Saxon origin (42 per cent) of any province except Quebec. German, Slavic, and Scandinavian elements account for 39 per cent, and French 6 per cent. There are 22,000 Indians, living mostly on reserves.

Education.—There has been an intense interest in public education in Saskatchewan from territorial times to the present day. Government support for voluntarily organized schools began in 1880 and the first tax supported schools appeared in 1884. Beginning with a system similar to Quebec's, the form of organization was gradually modified so that by 1905 educational affairs were controlled by a single government department with common curriculum, supervision, and teacher certification; at the same time provision was made for government grants and local tax support for elementary schools organized to serve the Protestant or Roman Catholic minority in any locality. Since 1944 over 50 larger units of school administration have been organized, providing a better financial base to support the continuous pressure for improved educational service. The provincial government gives grants to school districts, supports two teacher training colleges, encourages school libraries and music, and promotes the use of radio and visual aids. The University of Saskatchewan at Saskatoon, chartered in 1907 and supported by student fees and government grants, is the only institution (except theological colleges) empowered to grant degrees. It has attained a high reputation in the natural and applied sciences, and for many years has provided important adult education services.

Cultural and Recreational Activities.—There has been a widespread interest in music from pioneer times to the present, and there are annual musical festivals in the larger centers. Despite limited patronage, some distinguished work has been produced by Saskatchewan painters and writers. The Saskatchewan Arts Board, established by the provincial government in 1948, encourages creative activity in literature, drama, the visual arts, handicraft, and music. The Saskatchewan Archives Board, established in 1945, provides facilities for historical research and publishes an historical journal. There are libraries in all the larger towns and one regional library with headquarters at Prince Albert; for rural residents the government provides traveling libraries and a central reference library.

Sport has been an important factor in community life since the 1880's. Curling bonspiels are the largest in Canada, and golf and fishing have many devotees. There is intense and widespread interest in baseball, football, and hockey, which are organized in both professional and amateur leagues.

Religion.—Beginning with missions to the Indians in the 1840's, the church in Saskatchewan advanced with the westward moving agricultural frontier, supported by parent bodies in eastern Canada, Great Britain, and (latterly) the United States. As a center of community life and as a social influence, the church has played a vital part in the history of the province, and during the 1930's many church leaders exercised considerable influence in movements for political and economic reform. The 1951 census shows the largest denominations to be United Church of Canada (247,000), Roman Catholic (199,000), Anglican (95,000), Lutheran (91,000), Greek Catholic (37,000), Ukrainian Greek Catholic (37,000), Greek Orthodox (34,000), Presbyterian (33,000), and Mennonite (26,000).

ECONOMIC DEVELOPMENT

Agriculture.—Agriculture is and will remain the most important element in the provincial economy despite the recent discovery and development of nonagricultural resources. Total farm land in the province amounts to approximately 62 million acres out of a total land area of 152 million; of this, some 38 million acres are under cultivation. Saskatchewan ranks second in Canada and almost equal to Ontario in farm cash income from the sale of agricultural products. Farm implement sales are the highest in Canada, and in 1951 were 26 per cent of the national total. Saskatchewan is the major producer of wheat, oats, and rye, and ranks next to Alberta in barley and to Manitoba in flax according to 1952 statistics. In livestock marketings the province ranks third in cattle, fourth in hogs, sheep and lambs, and fifth in calves. Farm cash income in 1952 for field crops was $581,346,000 and from livestock and poultry $22,044,000.

Lumbering and Mining.—Major forest formations cover 45 per cent of the province, but production has been confined to areas accessible by rail and highway. The total value of forest products in the fiscal year 1952–1953 was $8,785,000.

Mineral production in 1952 was worth $49,500,000, the most important products being the metals of the pre-Cambrian shield area—copper, zinc, and gold—which represent 77 per cent of the total production value. The province ranks third in Canada as a producer of zinc and copper. It is the only province producing sodium sulphate. In 1952 it ranked third as a producer of salt and of coal (in tonnage), though the latter is lignite and reduces the province to fifth place in terms of its value (1952, $4,000,000). Saskatchewan has recently become a major producer of uranium, the most important activity being concentrated north of Lake Athabaska; there is intensive uranium prospecting activity throughout the Pre-Cambrian shield area.

Oil.—Saskatchewan ranks next to Alberta in the production of oil. The oil boom began in 1950 when 124 wells were drilled; in 1953, 674 were drilled and 3,000,000 barrels produced, valued at $4,300,000. Heavy crude oil has been found in considerable quantity, and there are also several medium and light oil areas. Extensive refinery expansion has followed the oil finds, which have also led to the discovery of large reserves of natural gas in the area between the north and south branches of the Saskatchewan river. Commercial and domestic use of natural gas began in 1953.

Manufactures and Trade.—In 1950 there were 10,596 persons engaged in manufactures in Saskatchewan who produced products with a net value of $49,494,641. There is less manufacturing than in the other two prairie provinces, the main activity being in the fields of flour milling, brewing, butter and cheese, meat packing, printing and publishing, and petroleum products.

Commerce has been the chief support of Saskatchewan's urban centers, from the hamlet with its railway siding, grain elevator, general store, and garage, to the city with its wholesale establishments, financial houses, and varied retail services. The country general store, the chain store, the co-op store, and mail order houses, are all important elements in the merchandising field. Retail sales in 1951 amounted to $654 million, of which $79.2 million was by chain stores and $39.9 million by cooperative purchasing associations. Though consumer cooperatives are not a dominant factor in retail trade they have made rapid progress since 1930, and in 1952 they had a membership of 133,000; their share of total retail sales arose from 2.1 per cent in 1935 to 6.5 per cent in 1952.

Commercial prosperity is closely related to farm income, and the marketing of farm products has always been a matter of vital concern to all classes in the province. In the period since World War I cooperative marketing organizations have developed on a large scale, and today they handle nearly two-thirds of the dairy products and more than half the grain, seed, and poultry; a little less than half the eggs and about one third of the livestock is marketed cooperatively. The largest of the marketing cooperatives is the Saskatchewan Wheat Pool, with a membership of over 139,000, owning 1,141 country elevators.

Financial Factors.—The rapid development of the provincial economy in the period of agricultural settlement was based on large amounts of credit from outside sources in the form of farm loans, urban real estate investments, and municipal and provincial government borrowings. Current farm operations were generally financed by banks and retailers. During the depression of the 1930's debt charges assumed serious proportions in the general economic and financial dislocation. The postwar period, however, has been one of rapid recovery and expansion, marked by sharp reductions in farm and municipal debt and in dead weight provincial government debt. At the same time public and private investment in productive enterprises has been increasing, and totaled $2,100 million for the period 1948–1953. In 1953, 346 new companies were incorporated and 253 extraprovincial companies were registered. Provincial government revenues have been buoyant, permitting a general expansion and improvement in public services.

TRANSPORTATION AND COMMUNICATION

Railroads, Airlines, and Highways.—With its hundreds of small communities scattered over a vast area, Saskatchewan has 15 per cent of Canada's total rail mileage; two transcontinental

lines cross the province, and almost every community in the agricultural area is situated on a railway. Trans-Canada Airlines and Canadian Pacific Airlines operate flights from eight major centers, including two transcontinental services. Saskatchewan Government Airways, based at Prince Albert, serves the forest and mineral belt of the northern half of the province. Saskatchewan has 38 per cent of the national road mileage, consisting of a network of provincial and municipal roads and the trans-Canada highway, which crosses the southern area through Regina. Interprovincial bus service is provided by Greyhound lines, and the government bus service operates on 35 routes within the province.

Telephones, Telegraphs, Radio and Television.—Telephone and telegraph lines follow the network of highways and rail lines. There are nine private radio stations, two of them French speaking, as well as the 50,000 watt Canadian Broadcasting Corporation transmitter at Watrous. For the isolated population of northern Saskatchewan there are seven provincial government stations providing radiogram service to the general public. Television stations operate in Regina and Saskatoon.

Newspapers.—Newspaper publishing in the province dates from 1878, when agricultural settlement was just beginning. Today there are four daily and over 150 local weekly newspapers, as well as weekly papers published in French, German, and Ukrainian, and several farm papers with large circulations.

PARKS AND PLACES OF INTEREST

Saskatchewan highways provide access to a variety of parks and places of interest which reflect the geography, economy, and history of the province. Cypress Hills Park in the southwest, one of six provincial parks, provides a striking contrast in vegetation and topography as compared with the surrounding plain nearly 2,000 feet below. Lower, but also well wooded, is the Moose Mountain provincial park in the southeast. The Qu'Appelle Valley, a huge gash carved by glacial waters, runs east and west for over 200 miles through the wheat lands, and contains many points of scenic and historic interest. Farther north, in the park belt, there is the saline Manito Lake, famed for the healing properties of its waters, and in the northeast central area, Madge Lake offers recreation facilities in a beautiful setting not far from historic Fort Pelly. Prince Albert National Park (1,496 square miles), one of the most popular in Canada, is located in Saskatchewan's forest belt; here, and at Lac la Ronge (110 miles farther north), camping and fishing opportunities have acquired a reputation far beyond the borders of the province. Points of historic, economic, and sporting interest in the far north (Ile à la Crosse, Stanley, and Uranium City) may be reached by air.

Special attractions in the cities and towns include: the museum of natural history, the Royal Canadian Mounted Police museum, the Mackenzie Art Gallery, and the Legislative Building and grounds in Regina; the University campus and the Western Development Museum at Saskatoon; the Fort Battleford National Historic Park at Battleford; the wild animal park in Moose Jaw; the Lund wild life exhibit and the historical society museum at Prince Albert. There are points of interest in most other urban centers, and many historic sites throughout the province (including historic trails), have been marked by distinctive highway signs.

GOVERNMENT

The Province.—The provincial government consists of a lieutenant governor, a 14-member cabinet and a 53-member Legislative Assembly, elected by British subjects 18 years of age or older. The cabinet (executive) is composed of members of the assembly and is responsible to it. The assembly meets annually, and its term is five years unless sooner dissolved. Broadcasting of selected assembly debates was inaugurated in 1946.

Premiers.—The names of provincial premiers since confederation, with the dates of their appointments, follow:

Walter Scott	Sept. 5, 1905
William Melville Martin	Oct. 20, 1916
Charles Avery Dunning	April 5, 1922
James Garfield Gardiner	Feb. 26, 1926
James T. M. Anderson	Sept. 9, 1929
James Garfield Gardiner	July 19, 1934
William John Patterson	Nov. 1, 1935
Thomas Clement Douglas	July 10, 1944

There is a large and well-organized public service staff which administers a wide variety of programs through 16 departments of government and 12 independent boards or commissions. Saskatchewan has a long record of experiment in the field of government services, and there has been frequent recourse to royal commissions to provide expert advice on problems affecting economic and social welfare. In the period since 1944 there have been many innovations and improvements in government services. Today, advanced public assistance and control measures exist in the fields of social welfare (aid to the aged, needy, blind, children, prisoners), resources' conservation, cooperative organization, industrial development, and employer-employee relations. Certain older fields of administrative activity—agricultural assistance, education, library services, highways and public health—have been greatly expanded. Of these, the most distinctive are the hospitalization plan (a subsidized scheme of compulsory hospital insurance covering every resident of the province), the air ambulance (a service operated at a nominal charge for residents of remote communities), and free treatment of cancer and mental illness. The province pioneered in the establishment of the municipal doctor system (1916) and free tuberculosis treatment (1929).

Participation of the provincial government in business enterprise began in 1909 with the establishment of the public telephone system; this was followed by other successful ventures—farm credit (1917), liquor stores (1925), and electric power (1929). Between 1944 and 1947 additional public enterprises were started as crown corporations, of which the most important and successful are the Insurance Office, the (bus) Transportation Company, the Government Airways, Forest Products, and Saskatchewan Minerals (sodium sulphate and clay products). The government fur marketing (1944) and fish marketing (1949) services, are agencies which provide facilities for producers of these products. The system of compulsory automobile accident insurance, inaugurated in 1946, is operated through the Government Insurance Office. Natural gas is being distributed by the public power corporation with an optional provision for municipal retailing.

Recent improvements in government services have been made possible by buoyant revenues.

About three quarters of net provincial revenue is derived from federal tax rental payments, general sales and gasoline taxes, and liquor sale profits; various licenses, fees, fines, and interest payments constitute the remainder. Net disbursements of capital borrowings and current revenues for 1953–1954 (est.) were for public welfare ($44.9 million), economic development ($47.5 million), general government ($7.1 million), and debt charges ($4 million).

Local Government.—The extent and prestige of provincial government services have contributed, along with straitened finances, to a relative decline in the status of municipal bodies and of popular interest in local government. There are 8 cities (minimum pop. 5,000), 89 towns (minimum pop. 500) and 388 villages (minimum pop. 100). These, along with the 299 rural municipalities (mostly consisting of nine townships), operate under the provisions of various provincial acts. The rural municipality is the taxing authority for rural telephone companies, the Municipal Hail Insurance Association, the Anti-Tuberculosis League, union hospitals, and health regions; both rural and urban municipalities raise the taxes for the school districts which are governed by their own boards. The chief local government revenues are real estate and business taxes, and a uniform system of assessment has been provided under provincial auspices for all municipalities except the larger cities. The borrowing powers of all municipalities are exercised under the supervision of the provincial Local Government Board (established 1913) to ensure a sound municipal credit structure. In the cities, public transportation is operated under municipal ownership, and four of them distribute or generate and distribute electric power.

A number of local improvement districts, varying from 26 to 96 townships in size, as well as the vast northern half of the province, have no local government organization, and various public services are provided for these areas under provincial government auspices.

Political Parties.—During the territorial period (prior to 1905) the party system did not develop in the local legislature, but following the establishment of the province the Liberal and Conservative parties appeared. The Liberals were in power from 1905 to 1929 and from 1934 to 1944. The only period of Conservative ascendancy was during 1929–1934, when a coalition government held office. In the late 1930's the Conservative party almost disappeared and the democratic socialist Cooperative Commonwealth Federation (CCF) gained strength, attaining office in 1944. Though the CCF is still the dominant party, the Liberals have sizeable voting strength and Conservative and Social Credit parties also participate in the elections. In federal politics, which is concerned with representation in the House of Commons, there has been less uniformity—the Conservatives were dominant prior to 1896, and the Liberals from 1896 to 1921; in the latter year the Progressive Party secured most of the seats. From 1926 to 1945 the Liberal Party regained its popularity, but since 1945 it has, on balance, won fewer constituencies than the CCF.

HISTORY

Fur Trade Era.—Evidences of human habitation dating from about 1400 B.C. have been found in Saskatchewan, but little is yet known of the history of the area prior to the penetration of the forest and park belt area by English and French fur traders from Hudson Bay and the eastern part of the continent. In 1774 the Hudson's Bay Company built a post at Cumberland House, which is the oldest permanent settlement in the province. The fur trade era was generally a period of peaceful coexistence between whites and Indians—the Crees and Assiniboines in the plains and forests and the Chipewyans in the far north. When Canada acquired the land between the Great Lakes and the Rockies in 1870 and organized the province of Manitoba and the Northwest Territories, the Saskatchewan area was opened to agricultural settlement for the first time. During the territorial period the nomadic Indians were cleared from the path of settlement and established on reserves, and the Canadian Pacific Railway was built across the southern plains (1882–1883). The only conflict with the aboriginal inhabitants took place in 1885, when there was a short-lived uprising of Indians and French half-breeds led by Louis Riel. By 1905 settlement had increased sufficiently to permit the establishment of a province.

1905 to Present.—Since 1905 the main feature of the history of Saskatchewan has been the rapid spread of agricultural settlement and the founding of hundreds of communities following an influx of immigrants from Eastern Canada, the United States, the British Isles, and many European countries. In the development of the prairie frontier, eastern Canadian business, religious and government institutions were active agents, and capital in large amounts was secured from the British Isles, the United States, and Europe. The pioneers created a highly productive economy, though one which has exhibited dramatic variations arising from Great Plains climatic conditions and the exigencies of international trade. The mingling and Canadianization of the various immigrant groups proceeded rapidly due to the following factors: economic conditions which produced a common outlook, the early establishment of a strong system of public education, adult education ventures of all types sponsored by government agencies and provincewide organizations, and the widespread interest in sport. Living in a province which produces over half of one of Canada's major exports (wheat), there is a firmly rooted popular sentiment favoring the reduction of barriers to international trade, and the newspaper press reflects a widespread and continuous interest in world affairs.

Possessing no metropolitan centers, Saskatchewan displays no significant cleavage of interest between urban and rural people, and the outlook and aspirations of the agricultural community have long dominated the political and social life of the province. The tradition of local cooperative activity and the prevailing view that government is an agency for cooperative achievement have since 1905 resulted in many political experiments and a wide variety of government activities; for the same reason, public opinion has generally favored strengthening federal government authority for the achievement of guaranteed minimum national standards of economic and social welfare and for the control of monopolies. The Liberal Party's early dominance (1905–1929; 1934–1944) in provincial politics was based on recruiting much of its leadership from farm organizations and on implementing the views of these organizations. The agonizing decade of

drought and depression prior to World War II led to a widespread demand for more radical measures than the Liberal Party was prepared to adopt, and in 1944 the Cooperative Commonwealth Federation was swept into office. The socialist ideology of this party has produced a variety of new ventures in public ownership and in welfare and educational services. Saskatchewan of the mid-20th century is distinguished by a mixed economy in which public, private, and cooperative ownership flourish side by side. The prosperous times since the end of World War II have produced a confident view of the province's opportunities and stemmed the population exodus associated with the depression and war years. The widespread celebrations of the Golden Jubilee of the province in 1955 betokened both confidence in the future and pride in the pioneer heritage.

Lewis H. Thomas,
Provincial Archivist of Saskatchewan

SASKATCHEWAN, a river in Canada, which has its sources in the Rocky Mountains near longitude 115° W. It is formed by the junction of two main branches, called respectively the North and South Saskatchewan, which flow generally east to their junction, about 25 miles east of Prince Albert, Sask. Thence the river takes a curve northeast and southeast, receives the Carrot River from the south, and, passing through Cedar Lake, empties into Lake Winnipeg, after a course of about 1,200 miles measuring along the south branch. It flows through a region yielding coal, salt, iron, and gold, which has attracted numerous settlers. From the south branch of this great river northwest to Peace River the climate is adapted to the growth of wheat. The main stream and its branches are navigable for about 1,000 miles.

SASKATCHEWAN, University of, located at Saskatoon in the Province of Saskatchewan, Canada. It was established by act of the provincial legislature in 1907 and classes were begun in 1909.

The campus and farm include 1,640 acres with a half-mile frontage on the Saskatchewan River. The land, buildings and equipment are valued at $10,000,000.

The library contains 120,000 volumes, including the Shortt library on Western Canadian history. The Physics Department has a 30 million volt betatron. The Prairie Regional Laboratory of the National Research Council and other Dominion Government laboratories are located on the campus.

Courses leading to the bachelor's degree are offered in arts and science, agriculture, engineering, law, pharmacy, commerce, medical sciences, education, household science, and nursing. Master's degrees can be obtained in practically all of the above; the Ph.D. is given in a few departments. For Ph.D. work at least one year of previous university education must be taken elsewhere. This university has the sole right to grant degrees (excluding theological) in the province. The Extension Department and the Department of Correspondence Courses offer a wide variety of services to the people of Saskatchewan.

Regina College, at Regina, Sask., is a branch of the university offering first-year courses in arts and science, commerce and engineering, a two-year laboratory technicians' course, and practical instruction in music and painting.

In 1951, the University of Saskatchewan had a faculty of 185 members and an enrollment of 2,600 full-time students. Colleges affiliated are as follows: Emmanuel College (Church of England), Saskatoon; St. Chad's College (Church of England), Regina; St. Andrew's College (United Church of Canada), Saskatoon; St. Thomas More (Roman Catholic), Sakatoon; Lutheran College and Seminary, Saskatoon; Lutheran Theological Seminary, Saskatoon; Campion College (Roman Catholic), Regina; St. Peter's College (Roman Catholic), Muenster; Luther College, Regina.

W. P. Thompson,
President, University of Saskatchewan.

SASKATOON, city, Province of Saskatchewan, Canada, situated on the South Saskatchewan River, 150 miles northwest of Regina and almost in the center of the settled area of the province. The city is served by the Canadian Pacific railway, the Trans-Canada and the Canadian Pacific airlines, and the Saskatchewan Transportation Company and Western Greyhound bus lines. The city is the center of a network of provincial highways and is so strategically situated in regard to transportation facilities that it is referred to as the "Hub" city.

Saskatoon is the business and distributing center of a large grain producing area comprising over 50,000 square miles of prosperous territory. The city has some 150 wholesale establishments and more than 500 retail outlets. In addition, Saskatoon has become a great milling center, with a daily output of over 8,000 barrels of flour. There is also a flax and oil seed mill. A Canadian Government Interior Terminal Elevator, with a storage capacity of 5,500,000 bushels, offers modern facilities for cleaning, drying and storing grain.

Most of the manufacturing in the city is related to the demands of an agricultural area. In all, there are more than 150 manufacturing concerns, including iron foundries, machine shops, woodworking plants, sheet metal works, tanneries, milling establishments, oil refineries, meat processing plants, candy factories and others. The city is the site of the largest independent meat packing plant in Western Canada.

Saskatoon is the seat of the University of Saskatchewan, a secular state university. Affiliated with the university are six colleges and nine professional societies. The city has a fine educational system. There are 18 public schools and 5 separate schools, with a total enrolment of over 8,000 pupils. The three collegiate institutes, a technical school, a normal school or teacher's college, a School for the Deaf, and three business colleges round out the educational facilities.

The city is well served by radio, newspaper, and libraries. There are three radio stations. There is a daily newspaper, the *Star-Phoenix,* publishing two editions, a farmer's weekly, a

farmer's monthly, a bimonthly devoted to the business and retail trade, and the university students' newspaper. The public library system is composed of a main building in the downtown area and 3 branch libraries which serve outlying districts. The Shortt collection of Canadiana in the university library is one of the most significant collections of its kind in Canada.

Saskatoon is governed by an elected mayor and 10 aldermen, with a city commissioner. The transit system, comprising trolley coaches and gasoline buses, is municipally owned. The city also owns the water works, the electrical distributing system, and the largest of the two general hospitals. The Saskatchewan Power Corporation supplies the city with natural gas, which is available for domestic and industrial use.

Saskatoon is a beautiful city, noted for its wide streets and fine buildings. Six bridges span the river within the city limits. Three of these are railway bridges and three are for vehicular and pedestrian traffic. There are 26 parks within the city, totalling just over 450 acres in area. The city offers golf courses, curling rinks, skating rinks, tennis courts, and many other sporting facilities.

Approximately 59 per cent of the population is of British origin. The largest groups of non-British origin are the German, Ukrainian, and Scandinavian groups. The largest religious denomination is that of the United Church of Canada, followed by the Church of England in Canada, the Roman Catholics, Presbyterians, and Lutherans.

History.—Saskatoon was founded as the administrative center of a temperance colony set up in the Canadian Northwest under the aegis of the Temperance Colonization Society. This organization was made up of people in Ontario who held strong temperance views. By arrangement with the Canadian Government the society acquired a large tract of land lying athwart the South Saskatchewan River, for colonization purposes. A party under John N. Lake came west in 1882 and chose the site for the future capital of the colony. The word *Saskatoon* derives from the Cree *Mis-sask-a-too-mina,* the name given an edible berry found in the vicinity. The original settlement was on the east side of the river, but the coming of the railway in 1890 and the decision to put the station on the west side resulted in the rise of West Saskatoon. The older settlement then took the name Nutana. The stopover of the Barr Colonists in 1903 aided the center economically. Saskatoon was incorporated as a city in 1906, the three settlements of Nutana, Riversdale, and West Saskatoon amalgamating to form one unit. The city underwent a spectacular boom period during the years 1909 to 1913. The depression of the 1930's slowed expansion, but the postwar period has seen new records set in many commercial fields. Pop. (1951) 53,268.

John H. Archer,
Librarian, Legislative Library, Regina, Saskatchewan.

SASSACUS. See Colonial Wars in America—*Pequot War.*

SASSAFRAS, săs'ă-frăs, a tree of the laurel family (*Sassafras albidum*), characterized by fragrant bark and roots, common in the eastern United States. Since it is readily propagated by seeds or by suckers which spring up from interminable slender rootstocks, and is apparently not liked by cattle, it is one of the first trees to reforest pastures and fields that have the light, moist soil that it affects. It is a veritable pest to one trying to clear land, as the smallest piece of rootstock left in the soil seems to send up a vigorous sprout. Its long roots, however, make it a difficult tree to transplant, unless young. Near the lower Mississippi, the sassafras attains its greatest height (about 100 feet). It is stout, with horizontal rugged branches, so that the foliage has a stratified appearance and a flattish top; it decreases in size as its northern limit is reached until it becomes only a tall shrub. The bark on old trees is very thick and gray, with longitudinal scaly ridges; on the young twigs it is pale green and easily slips off. The shining, bright green leaves will range in shape, on one spray, from an oval to a three-lobed outline, the "mitten shape," with one lobe at the side of the leaf, being characteristic. The flowers appear before the leaves in late winter if sheltered, and are generally unisexual, male and female blooms being found on different trees. They dangle in tassel-like racemes and are honey colored and honey scented, and thus attractive to bees. The staminate flowers are apetalous, with a six-lobed calyx, orange-stalked glands and nine stamens; the pistillate flowers have a similar perianth, a pale green ovary and style, and orange rudiments of stamens. The fruits are very brilliant, dark blue, oblong, thin-fleshed berries, surrounded at their bases as the cup encloses the acorn, with a bright scarlet calyx-tube, borne on a thickened and elongated stalk. Unfortunately they are so soon taken by the birds that they are seldom seen, but in autumn the leaves assume distinct tints, which deepen from soft yellow to dark red.

The roots of sassafras very early in American history became an important article of medicine, worth three shillings a pound, and they were one of the objects for which an English expedition landed in Massachusetts in 1602. It was also called ague tree, as a decoction of its bark was supposed to cure that disease. In American household practice, sassafras tea, an infusion of the young shoots and roots, was long a favorite remedy for colds and a tonic, being a sudorific and stimulant. It is also an ingredient of root beer. The oil of sassafras is used for a perfume for soaps and the like. The wood itself is orange colored, with pale sapwood, and when stripped of its bark resists decay for some time, while in contact with soil, so that it can be made into fence posts, although too brittle and coarse-grained for most purposes.

SASSANIDS, săs'ă-nĭds, name of a Persian dynasty founded by Ardashir (Artaxerxes) I (224–241 A.D.), a descendant of Sassan (Sāsān), with Ctesiphon as its capital and orthodox Zoroastrianism as its official religion. The dynasty numbered 25 kings, chief among whom were Shapur (Sapor) II (309–379), who battled for a long time against the Romans; Kavadh I (485–531), who invaded Syria; and Khosrau I (531–579), who forced the Byzantine emperor Justinian to pay tribute and ruled the empire at its greatest extent. In the reign of Yazdegerd III (632–641) the Arabians under the banner of Islam invaded Persia and added it to their rising caliphate. Sassanid organization and institutions greatly influenced the 'Abbāsid empire.

Philip K. Hitti.

SASSARI, säs'sä-rē, commune and province, Italy, in Sardinia. The city, capital of the province of its own name, is 12 miles southeast of its port, Porto Torres. It is situated on a height 650 feet above the sea, amid orange and olive groves. It is well-built and has several handsome palaces, churches, monasteries, nunneries, colleges, universities, an old citadel, a library, and a hospital. There is varied manufacturing; trade is carried on in grain, fruits, oil, cheese, and goatskins. The province occupies the north part of the island, having an area of 2,903 square miles. Pop. (1951) of commune, 70,243; of province, 349,625.

SASSOFERRATO, Il, ēl säs'sô-fâr-rä'tô (real name Giovanni Battista Salvi), Italian painter: b. Sassoferrato, Ancona, Italy, Aug. 25, 1609; d. Rome, Aug. 8, 1685. He learned the elements of his art from his father, and afterward went to Rome and Naples and studied under Raphael, Il Domenichino, Guido Reni, and Francesco Albani. His paintings, whose subject is chiefly the Madonna and Child, are filled with deep and true feeling and the coloring especially is elaborated with exquisite care, the principal scheme of his pictures including warm, luminous flesh tints, bright blue scarfs, and crimson robes, beautifully harmonized with consummate skill.

SASSOFERRATO, town, Italy, Ancona Province, seven miles north-northwest of Fabriano. Il Sassoferrato (q.v.) was born here. Nearby ruins of Sentinum recall a victory of the consuls Fabius and Decius there against Gauls and Samnites in 295 B.C. Pop. (1951) 13,498.

SASSOON, Siegfried (Lorraine), English poet: b. Sept. 8, 1886. Member of a Spanish-Jewish family which acquired wealth in the India trade in the 19th century, he was educated at Marlborough Grammar School and Clare College, Cambridge. During World War I he served in the army with distinction in France and Palestine. Beginning in 1919 he was for some years literary editor of the *Daily Herald*. His poems and prose works include *The Old Huntsman* (1917); *Counter-attack* (1918); *Satirical Poems* (1926); *The Heart's Journey* (1928); *Memoirs of an Infantry Officer* (1930); *The Weald of Youth* (1942); *Collected Poems* (1947); *Meredith: A Biography* (1948).

SATARA, sä-tä'rà, former district, India, with the mountain range now known as the Western Ghats as its boundary, extending eastward over an area of 4,891 square miles in central and southern Bombay Province. Ruled by the Muslim Bahmani kings from the 13th through the 15th centuries, it passed to the Bijapur monarchs and reached its zenith as an independent kingdom of the Mahrattas in the 18th century, with the town of Satara as the capital. The British controlled the region from 1818 and governed it directly from 1848. Pop. (1941) 1,327,249.

SATARA, town, India, capital of Satara North District, about 115 miles southeast of Bombay, lying at an elevation of 2,200 feet between two ridges. Now a center of trade, it was the seat of Mahratta rajas of the 18th century. A "modern" palace, built between 1838 and 1844, remains a point of interest, as does an older palace and a fort captured by the British in 1818. Satara Road, a former way station 10 miles to the northeast, boasts an important engineering plant engaged in the manufacture of machine and agricultural tools, internal combustion engines, and other aids to the growing Indian economy. Pop. (1941) 36,405.

SATARA NORTH, district, India, in south central Bombay Province. It lies between the Nira River, its northern boundary, and Satara South District. It was created in 1949 from the northern portion of Satara District and additional territories. The capital is Satara. Wheat, millet, rice and peanuts are grown and the well-forested mountains to the east provide teak and other woods. Mahabelshwar is a famous resort town. Pop. (1951) 1,175,309.

SATARA SOUTH, district, India, constituting the southern part of the former district of Satara and parts of seven former states. It came into existence in 1949 as the southern neighbor of Satara North. The Kistna River drains its western portion and flows through Sangli, the capital. The weaving of cloth is a common occupation but agriculture is the chief industry, with sugar cane, tobacco, cotton, and millet among its products. Pop. (1951) 1,000,141.

SATELLITE, Artificial, an object placed in an earth-circling orbit by means of a multiple-stage rocket, which lifts it from the earth's surface to its orbit in space. A true satellite orbit is an ellipse with the earth's center at one focus of the ellipse (Fig. 1) and is controlled completely by the earth's gravitational field (see Gravity). If the orbit does not intersect the earth and the satellite does not experience the drag of the lower atmosphere, it will last for a long time. If the orbit descends to as low as 100 miles, the satellite's lifetime will be of the order of a few days; its exact value depends on the size and weight of the satellite vehicle. If there were no atmosphere, a satellite could operate at sea-level altitudes. The plane of the orbit must contain the center of the earth but may have different orientations: it may contain the equator (equatorial orbit), or the poles (polar orbit), or it may be inclined (Fig. 2). This orientation is a matter of choice and design, since the orbit is determined completely by the magnitude and direction of the velocity at the burnout of the last rocket stage (see Rocket). In order to make the orbit as nearly circular as possible, the burnout velocity should be horizontal and have the value of the circular velocity. This velocity decreases with increasing altitude and at 300 miles corresponds to 4.737 miles per second. To achieve a near-circular orbit which will last for more than a few days, this speed must be controlled to about 1% and its deviation from the horizontal must be less than 1°. The orbital period at 300 miles is 94 minutes and 10 seconds; it increases with increasing altitude (Fig. 3). At this orbital altitude, which corresponds to that of a minimum satellite,[1] the only important astronomical perturbation is due to the non-spherical shape of the earth (see Solar System—*The Lunar Problem*). Because of this, the orbital plane will precess (see Equinoxes, Precession of the), if it is inclined (Fig. 4). There are no first-order perturbation effects in polar and equatorial orbits; however, very small gravitational effects are produced by the sun, the moon, and terrestrial mountain ranges.

[1] The elliptical shape of the orbits employed may cause the satellites to range from a minimum distance (perigee) of 200 to 250 miles to a maximum distance (apogee) of 800 to 900 miles.

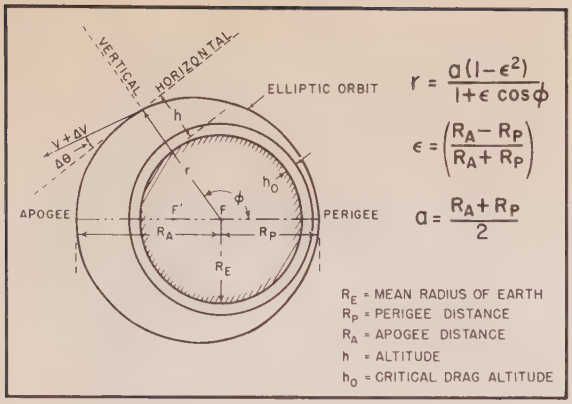

FIG. 1. EQUATION OF ORBIT. The orbit in general is an ellipse whose apogee and perigee altitudes are determined by the launching error in speed, $\triangle V$, and in inclination, $\triangle\Theta$. In order to obtain a long lifetime for the satellite, the perigee must be kept above at least 100 miles. This places severe limits on the allowable launching errors.

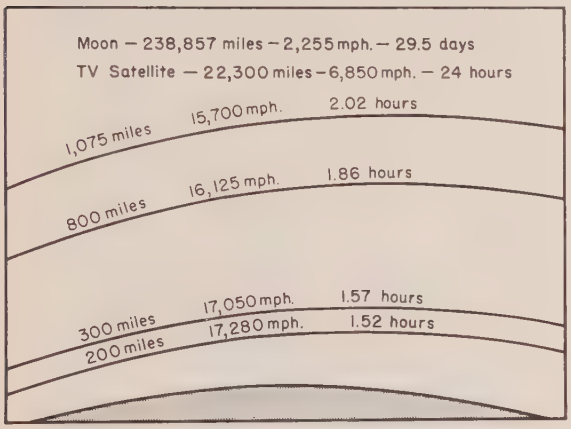

FIG. 3. Orbit characteristics giving altitude, speed, and period of revolution.

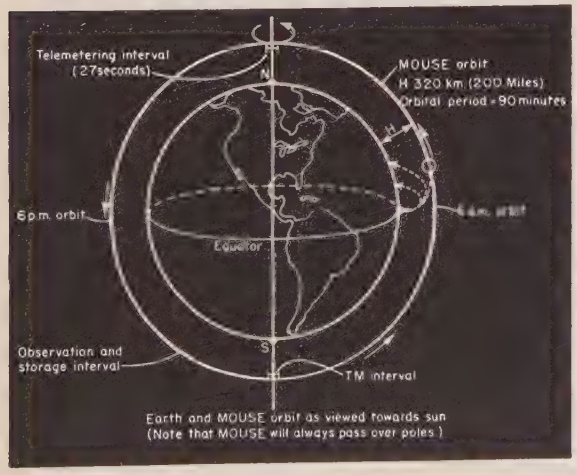

FIG. 6. Diagram showing the launching of a satellite in a polar orbit. Since this satellite passes over the poles during every orbit, the information to be transmitted is stored and then released in a brief telemetering interval over the poles.

SATELLITE, ARTIFICIAL

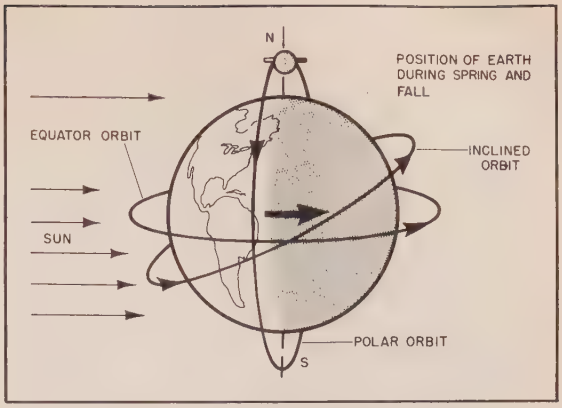

FIG. 2. POSSIBLE SATELLITE ORBITS. The position of the orbital plane is determined by the direction of the burnout velocity of the last rocket stage. During mid-summer and mid-winter the sun's rays will be inclined 23½° to the earth's equator.

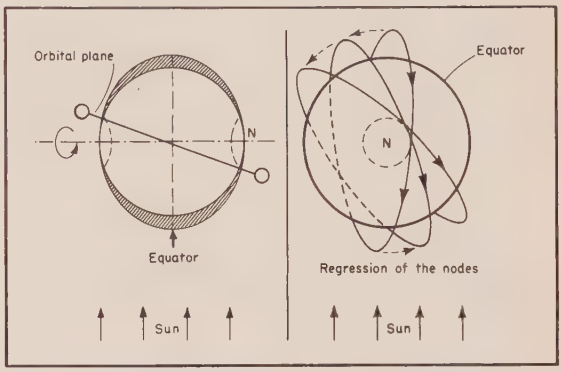

FIG. 4. ORBIT PERTURBATIONS. The equatorial bulge of the earth will produce a gravitational action on the satellite which causes the satellite orbit to rotate in space, producing a regression of the nodes.

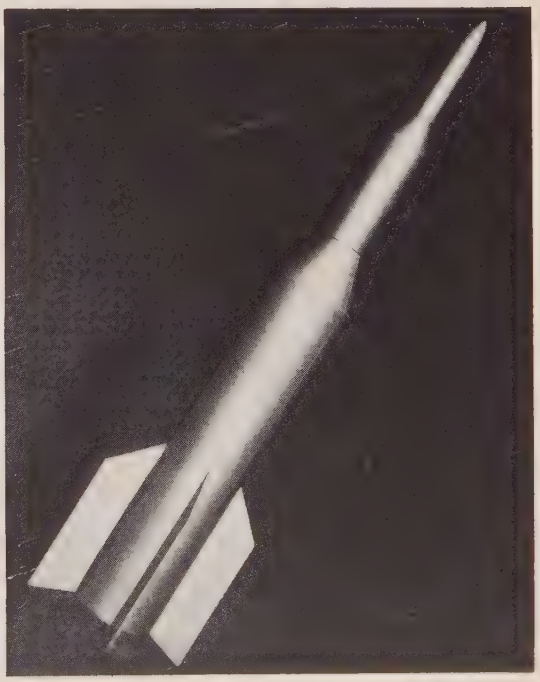

FIG. 5. Model of three-stage rocket for providing the necessary orbital velocity. The satellite is housed in the nose of the final stage.

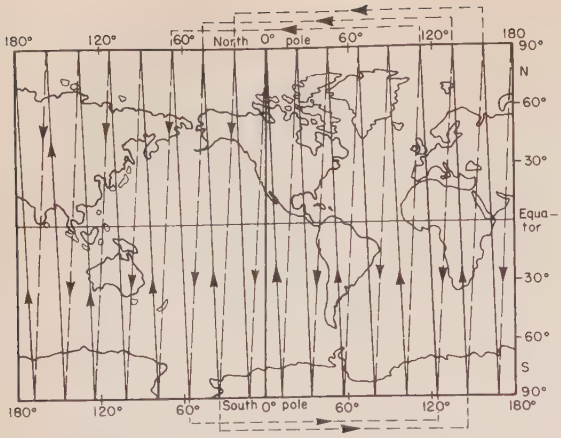

FIG. 7. Trace of MOUSE orbit over earth (period = 90 min.). S–N path 6 A.M., N–S path 6 P.M. local time.

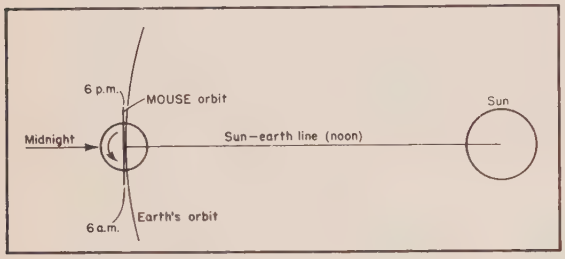

FIG. 9. Diagram showing the orbit of a MOUSE satellite perpendicular to the sun-earth line. Note that the satellite appears overhead only at 6 A.M. or 6 P.M. local time.

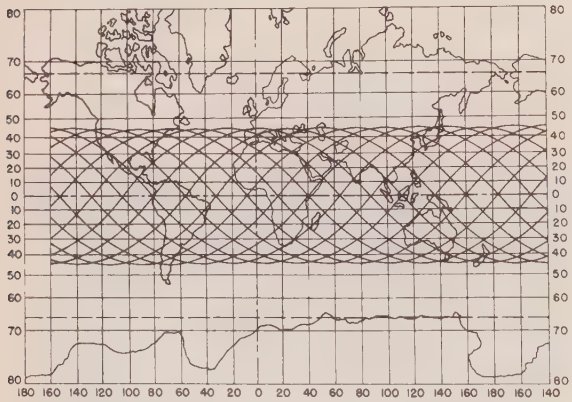

FIG. 11. Trace of an inclined-orbit satellite over the earth's surface.

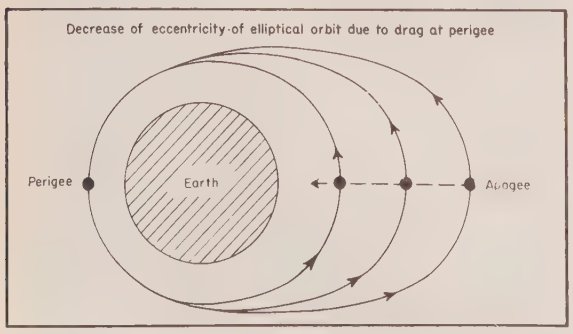

FIG. 12. An elliptical orbit will shrink into a near-circular orbit due to atmospheric friction. After that the satellite will spiral rapidly into the earth and disintegrate in the atmosphere.

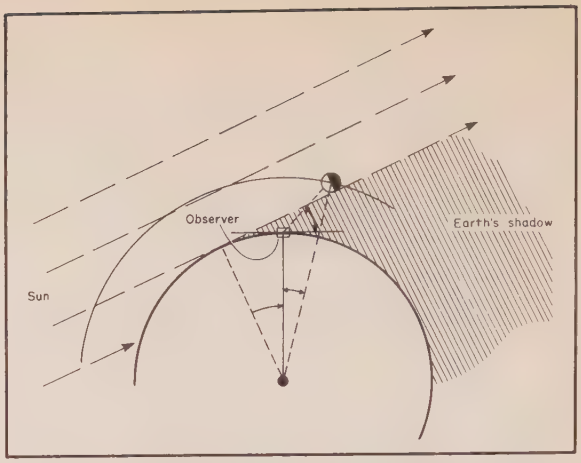

FIG. 8. OPTICAL VISIBILITY OF SATELLITE. A small satellite would be practically unobservable with the naked eye. With the help of optical instrumentation it can be observed for short times only when the sun is just below the horizon. The optimum condition is achieved when the lower atmosphere is in the earth's shadow and the satellite, high up, is illuminated by the sun's rays. However, to find the satellite, the optical instrumentation must have a wide field of view, and it should also be able to track the satellite.

Diagram of gyroscopic stabilization scheme, solar power supply, and astrophysical instrument

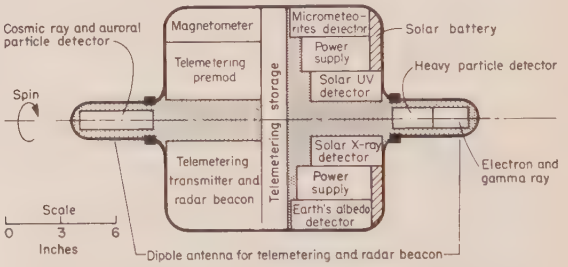

FIG. 10. SCHEMATIC DIAGRAM OF MOUSE SATELLITE. Geiger counters are used for the detection of cosmic rays, and special counters for auroral particles and heavy cosmic ray particles. The solar UV and X-ray detectors could be photon counters. The earth's albedo detector is a simple photocell. The magnetometer could be based on the proton precession principle.

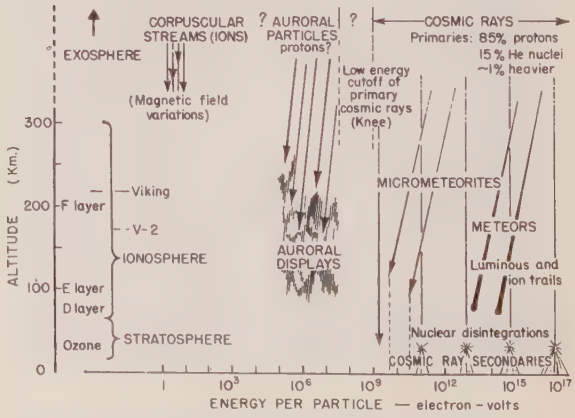

FIG. 13. PENETRATION OF PARTICLES INTO THE ATMOSPHERE. Particles arriving from outer space are stopped or modified by the atmosphere and must, therefore, be observed above the atmosphere.

Propulsion.—Propulsion by means of rockets is necessary, since the high velocities of orbital revolution must be attained above the atmosphere where rockets alone will operate; in the lower atmosphere, a satellite travelling at these speeds would heat up too much and melt. In order to achieve the high velocities, it is necessary to construct rockets of very high mass-ratios, that is, ratios of propellant load to gross weight. This ratio is always less than unity because of the unavoidable weight of the rocket structure. It is possible, however, to achieve an effectively high mass-ratio by employing the so-called step-rocket principle (Fig. 5). Here successively smaller rockets are superimposed in tandem and operate one after the other while the burnt-out stages fall away. In this way the final payload, although of very small weight, can achieve the necessary high velocity. The optimum number of stages is in the vicinity of three. If more stages are used, the take-off weight decreases somewhat but the complexities become enormous. If only two stages are used, the first rocket must be quite huge. The first rocket stage must traverse the atmosphere rapidly and is therefore launched in a vertical direction. It continues its vertical ascent until it reaches the limit of the appreciable atmosphere. It then begins to tilt, and this is carried on by the succeeding propulsion stages until the final velocity vector has the correct value and points to the horizontal. This can be done through radio guidance or through a preset program which tilts the rocket jet by means of gyroscopic control (see GUIDED MISSILES). In general, two types of ascent trajectories are possible: 1) a powered-all-the-way trajectory in which successive stages burn without any coasting gaps, until the final desired velocity is reached; or 2) an initial burning period followed by a coasting period to the desired altitude where a final thrust is applied to achieve the necessary velocity. The latter method is more economical since it utilizes the available propulsion more efficiently; however, it requires more elaborate controls. Once in its orbit, the satellite needs no further propulsion.

Effect of Environment.—In addition to gravitational influences of the earth and other celestial bodies, a satellite is subjected to various outer-space radiations incident on the earth as well as to radiations emanating from the earth; the satellite also undergoes collisions with atmospheric molecules and atoms, and with meteoric dust. Most of the energy absorbed by the satellite comes from the sun. Solar radiation is also reflected upward from the earth (the so-called albedo radiation). These sources of energy serve to heat the satellite until it reaches an equilibrium temperature. The value of this temperature is controlled by the surface properties of the satellite, by possible internal heat sources in the satellite, and by the type of orbit the satellite takes about the earth. The albedo of the earth, produced mainly by reflections from clouds, also has an influence on the equilibrium temperature. In most cases these temperatures will be quite reasonable; therefore no special materials have to be used to construct the satellite. Ultraviolet radiation from the sun and from other celestial sources will in general have no deleterious consequences on the satellite structure except perhaps on plastic windows. It is believed that the intensity of X-rays and gamma rays above the atmosphere is too low to be of any concern. The effects of cosmic rays are quite small although they may produce cumulative nuclear transmutations in satellites remaining above the atmosphere for very long periods of time; these are of importance mainly in the transistors and other semi-conductor devices in the electronic instrumentation. More serious are the effects of meteoric dust particles and occasional larger meteors (q.v.). They will erode the surface of the satellite and may, if of high enough momentum, pierce the skin of the satellite. They may constitute a real hazard during periods of meteor showers when the frequency of meteoroids is much enhanced.

Selection of Orbits and Communication Problems.—One of the important considerations is to select an orbit for the satellite which is both convenient from the propulsion point of view and useful from the instrumentation point of view. An equatorial orbit is the easiest to achieve since the required orbital velocity would utilize the 960 miles per hour rotational velocity which the earth possesses at the equator. Unfortunately, the area of the earth's surface traversed in this orbit is a minimum and many geophysical investigations in which all latitudes have to be covered could not be carried out using this orbit. On the other hand, a single receiving station located on the equator would be in communication with the satellite for a short time during every orbit. An orbit across the poles (Fig. 6) would require somewhat more propulsion effort for a given payload. Here all of the earth's area (Fig. 7) would be traversed since the earth rotates underneath the orbit while the orbital plane remains fixed in space. If it is desired to observe the satellite continuously (Fig. 8), many receiving stations would have to be used. However, if it is sufficient to receive communications from the satellite once or twice during every orbit, a station at one or both poles would be adequate. This orbit is the most useful one from the geophysical point of view since the latitude dependence of many phenomena, such as cosmic rays, could be studied. If, in addition, the orbital plane is nearly perpendicular to the sun-earth line (Fig. 9), then the satellite will be in sunlight all of the time if launched near the equinox, and most of the time if launched in mid-winter or midsummer. This is the particular orbit contemplated for the MOUSE (acronym for Minimum Orbital Unmanned Satellite of the Earth), which is designed for geophysical and astrophysical observations (Fig. 10). In this orbit the satellite will not only be able to observe the sun's radiation for most of the time, but it can also obtain energy from the sun to run the radio transmitter and other instrumentation. In order to view the sun continuously the MOUSE satellite is oriented in space by spinning it about a horizontal axis which points towards the sun. This satellite is then essentially a gyrowheel. Since to a first approximation no torques are acting on the satellite, this spin axis will keep pointing at the sun as the satellite travels around the earth. It is possible to devise other means for giving the satellite a certain orientation in space, but they are more complicated. An orbit which is inclined to the equator (Fig. 11) would cover a large portion of the earth's surface but would be difficult to observe or communicate with unless a large number of ground receiving stations were used.

General Instrumentation of a Satellite.—A satellite which is to be used for recording extra-terrestrial radiations must transmit this information to the ground; it therefore needs a radio

transmitter and a supply of electrical power. Because of their large weight there is a limit to the number of chemical batteries which can be provided. It should be possible, however, to convert solar energy into electrical energy, for example, by means of the silicon solar battery (see SOLAR POWER—*Solar Batteries*). With an efficiency of about 10 per cent the power generated can be as high as 0.1 watts per square inch of surface area.

Applications of a Satellite.—By merely observing the orbit of the satellite and its changes with time it is possible to deduce the satellite's drag (Fig. 12) and, therefore, the densities of the upper atmosphere. Observations of the orbit for long periods of time also permit calculation of the major perturbations, principally due to the shape of the earth.

Various measurements of extraterrestrial radiations (Fig. 13) and atmospheric properties are possible, among which are the following: 1) *Cosmic Rays.* The variation of cosmic ray intensity can be measured as a function of time. By making use of the fact that the earth acts as a magnetic spectrometer for the electrically charged cosmic ray particles, the energy spectrum of the radiation can also be determined. It is important to measure these quantities during periods of solar activity (see SUN) to determine how the cosmic rays are accelerated by the sun and influenced by interplanetary conditions. An important refinement also would be to measure, during solar activity, any changes in the composition of the primary cosmic radiation from the normal distribution of 85 per cent protons, 14 per cent helium nuclei and 1 per cent heavier nuclei. 2) *Solar Ultraviolet and X-rays.* The satellite could measure intensity changes of these radiations during periods of intense solar activity. This would aid both in the study of the basic processes occurring in the solar atmosphere and also in the study of the effects of these radiations on the earth's ionosphere. 3) *Earth's Magnetic Field.* By measuring with a magnetometer the variations with time of the earth's magnetic field at high altitudes, it is possible to determine the position and strength of currents flowing in and above the earth's atmosphere. 4) *Earth's Albedo.* By measuring the amount of sunlight reflected from the earth, a satellite can determine the degree of cloud cover, its distribution, and variation with time. This may have important applications in long-range weather prediction. See also ATMOSPHERE; COSMIC RADIATION; EARTH; ROCKETS; SPACE RESEARCH; TERRESTRIAL MAGNETISM; UPPER ATMOSPHERE; UPPER ATMOSPHERE, SOUNDING METHODS OF THE—*Rocketsonde Research.*

Associate Professor of Physics, University of Maryland.

SATELLITE COUNTRIES, a term used in international relations to describe nations which fall within the orbit of power and influence of some other nation or nations. A satellite country has less political and economic power than the nation dominating it, and generally supports the latter's policies in international relations. In power politics, the world is made up of a small number of dominant nations and a large number of satellite nations.

SATELLITES, in astronomy, secondary planets or moons. One satellite has been observed with Neptune; five with Uranus; Saturn has nine or 10, Jupiter 11, Mars two, and the earth one. The rings of Saturn have been said technically to be composed of a great number of satellites, but these are probably exceedingly small, and are possibly not larger than particles of sand or dust.

SATIN, in textile manufacture, a closely-woven silk, in which the weft is hidden, presenting a glossy surface. In the manufacture of other silken stuffs each half of the warp is raised alternately; but in weaving satin the workman only raises the 5th, 8th or 10th part of the warp; thus the weft is hidden beneath the warp, which, presenting an even, close and smooth surface, is the more capable of reflecting the rays of light. In this way satin acquires that luster and brilliancy which distinguish it from most other kinds of silks. Sometimes satin is made with a pile and flowered pattern and it is then termed satin-damask. Satin was first woven in ancient times in China. Early European seats of satin manufacture were Lyons, France, and Genoa and Florence, Italy. Modern manufacture varies fiber, weight, and quality, so as to produce a number of kinds of satin. Silk warp and cotton filling constitute slipper satin. From the East Indies come those light stuffs called Indian or Chinese satins. They are plain, damasked striped, open-worked, or embroidered. See also WEAVING, HAND LOOMED.

SATIN BOWERBIRD. See BOWERBIRDS.

SATINFLOWER. See STAR-OF-BETHLEHEM.

SATIN SPAR. See SPAR.

SATINWOOD, the product, principally of the *Chloroxylon swietenia,* of India and Ceylon. This is a small tree with large panicles of whitish flowers and deciduous, long, pinnate leaves, and can furnish a log three to six inches square. The wood is very hard, close-grained and durable, and light orange in color; it takes a fine polish and when of the feathered variety is very beautiful, but liable to split. In the 18th century this ornamental wood was much in demand for handsome furniture, with scroll work, and with medallions painted upon it. It is now principally used for cabinetwork, for picture frames, the backs of brushes and marquetry. Several other species of trees in the East and West Indies, especially the *Maba buxifolia* and *Xanthoxylum caribaeum,* produce woods of similar appearance, quality and name.

SATINET, an inferior fabric, woven much thinner than ordinary satin. The name is also given to a kind of cloth woven, with cotton warp and woolen weft, to imitate satin.

SATIRE, a kind of literary composition in verse or prose, in which wickedness or folly is censured and held up to reprobation; it is a

word of Latin origin, and the ancient Roman poets were the chief inventors of the satire. From the time of Lucilius (d. c.102 B.C.) till now, says Dryden, "the very name of satire is formidable to those persons who would appear to the world what they are not in themselves." Of the four princes of Roman satire—Lucilius, Horace, Persius, Juvenal—Persius (d. prematurely in the reign of Nero) is the least important. Juvenal (who appears to have produced satires in the reign of Domitian and who survived into the time of Hadrian, 117 A.D.) uses satire with consummate power and spirit, as an engine for attacking the brutalities of tyranny and the crimes, the follies and the frenzies of a degenerate society: he is confessedly the foremost satirist not only of ancient but of all times: great modern poets of all countries have translated or imitated the 16 satires of Juvenal; and he has been better translated into English than almost any other ancient poet. Horace (Augustan period) developed satire into a branch of composition peculiarly his own, and in this branch he is without a rival: he ridicules the follies of the world from the point of view of a man of the world; and though his morality does not rise above the level of a prudential moderation, he enforces it with so much dramatic liveliness and gay humor that he has ever been the favorite poet of men of letters and epigrammatists.

A totally different form of satire is the medieval *Reynard the Fox, Till Eulenspiegel, Piers Plowman;* followed in the Reformation epoch by Ulrich von Hutten's *Epistolae Obscurorum Virorum,* Erasmus' *Praise of Folly,* Rabelais' *Gargantua,* Buchanan's *Franciscanus,* and others. In Spain, where no freedom of criticism existed, the spirit of satire took refuge in the picaresque novel, prototype of Lesage's *Gil Blas;* Cervantes' *Don Quixote,* too, might be classed as a satire were it not so much more. Most of the great dramatists of the 17th century were more or less satirists; among them Molière stands pre-eminent. Butler's *Hudibras* is a model of unadulterated satire; and political satire is carried to perfection in Dryden's *Absalom and Achitophel.* Swift excelled at satire. In France, Nicolas Boileau-Despreaux was regarded as the modern Horace in satire and in the mock-heroic, but in both respects he was equaled or even surpassed by Pope. In Germany the most conspicuous satirist was probably Christoph Martin Wieland. In England in the 19th century, the foremost satirists were Byron, Hood, Hook, Jerrold, and, among novelists, Thackeray; in the United States, James Russell Lowell, through the *Biglow Papers,* held high rank in political satire. In the 20th century such English-language novelists as Aldous Huxley, Evelyn Waugh, and Sinclair Lewis made use of satire, the first two, particularly, mixing it with fantasy and farce.

SATISFACTION, in law, the satisfying of an obligation or claim, as by performance, payment, or giving an equivalent; indemnity for an injury. The doctrine of satisfaction is of importance in the interpretation of wills and also in the law of contracts. For example, if a debtor by will bequeaths to his creditor a legacy at least as great as an existing debt, such legacy is held to be a satisfaction of the debt in the absence of any circumstance rebutting this presumption. Likewise it has been held that where a person has agreed to manufacture, to the satisfaction of the buyer, an article, as an engine, in which personal taste is not directly involved, but merely mechanical utility, the buyer is bound by the contract if he has no reasonable grounds for refusing the article after its completion.

SATOLLI, sä-tōl'lē, **Francesco,** Italian ecclesiastic: b. Marsciano, Perugia, Italy, July 21, 1839; d. Rome, Jan. 8, 1910. He became professor of dogmatic theology at Urban College of the Propaganda, Rome (1880), and in 1888 was made archbishop of Lepanto. He came to the United States in October 1892 as appellant judge with extraordinary discretion. His action in regard to several notable church controversies raised up a party of opposition against some of his proposed measures in ecclesiastical affairs in America. In January of the next year an order came from Rome quelling the opposition and creating Monsignor Satolli permanent American apostolic delegate. He was named cardinal in 1895, and he returned to Rome in 1896.

SATRAPS, sā'trăps or săt'răps, the name given the governors of provinces in the ancient Persian empire. The power of the satrap, so long as he retained the favor of his sovereign, was absolute; he levied taxes at his pleasure and aped the capricious tyranny of his master unchecked. When the monarchy of Cyrus began to decline many of the satraps threw off their allegiance and founded independent kingdoms of their own. The term "satrap" is sometimes used to signify a petty despot.

SATSUMA, săt-sōō'mȧ, Japan, former province in the southwestern part of the island of Kyushu, now a part of the prefecture of Kagoshima. It played an important part in the history of Japan, and before the revolution of 1868 it was one of the most powerful feudal strongholds. Its samurai ably supported the revolution which placed the mikado in power, and readily yielded their prerogatives in order to secure a stronger nation. However, they rose in rebellion under Saigo Takamori in protest against the predilection of the court for instituting foreign customs in 1877; but the rebellion was put down. The province manufactured a beautiful porcelain, known as Satsuma ware.

SATSUMA WARE, a fine kind of pottery or semiporcelain made in Japan, having a feldspathic glaze of a light straw color, the surface of which is covered with a network of fine cracks. Red and green colors and dulled gold are employed for decorating the ware. Fine old Satsuma ware is highly esteemed by collectors. See JAPANESE CERAMICS; POTTERY—*History.*

SATURDAY, so called from the planet Saturn, the seventh day of the week; the Sabbath of the Jews. It is called by the Italians *Sabato;* by the French, *Samedi* and by the Germans, *Sonnabend* (Sunday eve), or in High German, *Samstag,* a corruption of *Sabbathstag* (Sabbath day); and in Low German, *Saturdag,* of the same origin as the English.

SATURN, an ancient Italian divinity, husband of Ops and father of Picus. He was the god of seed time and harvest, and is represented as bearing a sickle. He was later identified with the Greek Cronus, who, driven from his

supreme throne by Zeus, came to Latium and set up his kingdom there. Under his reign was the Golden Age. At Rome his throne was shared by Ops, afterward identified with Rhea, and in the time of the last Tarquin a temple was built to him at the foot of the Capitol and was afterward used as the treasury (Saturni Aerarium). The foundations of this temple and eight pillars still remain. The statue of Saturn was all year long swathed in woolen bandages excepting during his festival, the Saturnalia (q.v.), when it was uncovered to the eyes of the people.

SATURN, the sixth planet from the Sun, and the second largest in the solar system, is further distinguished by having a system of rings which makes it the most spectacular of the planets. It was the most distant known to the ancients and so continued until the discovery of Uranus in 1781. The disk is yellowish in the telescope. Its brightness at opposition varies from −0.4 to +0.9 magnitude. The first coincides with the time when the plane of the rings is at its largest angle of 27° as seen by us, the second when they are seen edgewise. In the first case, the apparent width of the rings is about one half the length. It is, therefore, obvious that the rings may reflect more light to us than the planet itself, assuming that, area for area, the rings reflect light equally well. Since it is a superior planet it is best observed near opposition. Its sidereal period being 29.6 years, an opposition will occur about 13 days later each year than in the previous one. The last occurred on April 28, 1954.

Shortly after Galileo had invented a telescope, on studying Saturn in 1610 the planet seemed to him to have handles, or, in a sense, to be triple. For some decades observers, with the crude telescopes then available, drew it in various fantastic shapes. It was all the more mysterious as sometimes (when we passed through the plane of the rings) the planet appeared round, then slowly the extensions came back into view. Finally in 1655 Christian Huyghens, after careful study, announced that "the planet is surrounded by a thin, plane ring nowhere touching it, and inclined to the ecliptic." The planet's orbit has a semi-major axis of 9.53884 astronomical units which corresponds to 887,140,000 miles. However, due to the large eccentricity of 0.05570, when at perihelion Saturn is only 837,726,000 miles from the Sun, while at aphelion it is 936,554,000 miles. If, therefore, opposition occurs when Saturn is near perihelion, the planet may be 99 million miles nearer the Earth than in the latter case.

The planet at mean distance has an equatorial diameter of about 17″.3, corresponding to a linear diameter of 74,500 miles. Due to irradiation the value may be uncertain to nearly 1 per cent. It is the most flattened of all the planets, its polar diameter being 7,800 miles less than the equatorial. In terms of the Earth its surface is 81 times, its volume 735 times, and its mass 95 times greater. The mass of Saturn is particularly well determined both from observations of its numerous satellites and also from the perturbations it produces upon Jupiter. Indeed, as these two, which are the largest of the planets, may approach within four astronomical units of one another when closest, their mutual perturbations are very large. The result is that the elliptical orbits of both planets are considerably changed in shape due to the gravitational pull of the other. It has the lowest planitary density, 0.72, that of water. Saturn would float, could one find an ocean large enough. A mass would weigh 1.17 times, by a spring balance, what it would upon the Earth, but this number would vary greatly in different latitudes, being least at the equator. Its belts are far less well-defined than those on Jupiter, and are largely lacking in detail. They run parallel to the equator. Yellow and green colors predominate. Spots occur very occasionally: those near the equator give 10 h. 14 m. as the rotation period, but one in latitude 36° N. gave 10 h. 38 m. The last prominent spot appeared in 1932. The rotation can also be determined by the spectroscope, which proves that the period increases considerably as the poles are approached. Like the Sun and Jupiter, its surface therefore shows the equatorial acceleration. The planet's axis is inclined 26° 45′ to the plane of its orbit, and the latter is only 2.5° from the plane of the ecliptic. The rings lie in the plane of Saturn's equator. At the equator, centrifugal force equals one sixth that of gravity. By using the ratio of this to the ellipticity of the planet, a result of 0.65 is found. This proves a great central condensation. The model worked out by Rupert Wildt indicates that the solid core (probably partly iron-nickel) has a radius of about 13,000 miles, covered by a layer of ice 8,000 miles thick, which in turn supports an atmosphere of compressed gases 15,000 miles deep. These latter, according to spectroscopic evidence, consist largely of methane and ammonia, the first stronger, the latter weaker than similar absorption bands in Jupiter's atmosphere. Saturn receives little more than 1 per cent of the solar radiation on the Earth, hence, as expected, its surface temperature is low. Direct measurements give about −150°C. Henry N. Russell, however, states that this is a considerably higher temperature than direct solar radiation should cause. As there can scarcely be appreciable radiation from the interior, any difference is difficult to explain. As with the Sun and Jupiter the edges of the disk are less bright than the center. The albedo is about 42 per cent. It is obvious that no form of life, such as life is known on the Earth, could possibly exist on Saturn or, for that matter, on any of the five outer planets.

The rings not only make the planet a most beautiful object but have presented scientists with most interesting problems. The rings are usually indicated by the letters *A, B, C*—the order being from outside towards the planet. First, as to dimensions, the maximum diameter is 171,000 miles. Ring *A* is about 10,000 miles wide and is not as bright as *B*, from which it is separated by the Cassini division, discovered in 1675 by Jean D. Cassini at the Paris Observatory. This latter is perhaps 2,500 miles wide but looks much narrower, due to irradiation. Ring *B* is 16,000 miles wide, and near its outer edge is as bright as the planet itself. It, in turn, is separated from *C*, the "crape ring" by a space about 1,000 miles wide, while *C* itself is 11,500 miles in width and its inner edge 7,000 miles from Saturn's surface. The thickness of the rings is extremely small: most authorities give about 10 miles. Strange to say, *C* was discovered only in 1850 by William C. Bond at Harvard Observatory, and independently, two weeks later, by W. R. Dawes, in England. Why it was not detected earlier it is difficult to say. The extreme thinness of the rings is proved by their becoming invisible for a day or

two when we pass directly through their plane and they are edgewise to us. This occurs twice per revolution of Saturn or at 15-year intervals. It will next occur in 1965. The Earth, during such years, actually passes once or three times through the plane of the rings, according to circumstances. At about 7½ years from such transits, the rings open up to their widest, as we see them.

A century ago it was shown theoretically by Benjamin Peirce and James Clerk Maxwell that neither a solid nor liquid ring could be stable. If one could be created and placed about the planet, perturbations of the satellites would eventually break it into fragments. In 1857 Maxwell proved that a ring composed of innumerable little solid bodies, provided their total mass was small, would be stable. Also, in 1850, Edouard Roche proved that a liquid satellite of any planet, if its density and the planet's were the same, would be distorted by the latter's tidal forces, provided it lay outside a distance equal to 2.44 radii of the planet; if it came inside this critical limit, tidal forces would tear it to pieces. Saturn furnishes an excellent practical example, for the outer edge of the rings lies only 2.30 radii from the planet's center, while Mimas, the innermost satellite, is at 3.11 radii. The latter is, therefore, beyond the danger limit, all of the rings being well inside. These facts give us a possible explanation for the rings because, if one or more satellites, either fully formed or embryonic, ventured within the 2.44 limit, they would have been destroyed. At first, the separate pieces would follow somewhat intersecting orbits, but as time went on there would be constant collisions, the results of which would both make the fragments smaller and the orbits more circular. By now all the fragments are very small indeed. While theory a century ago had predicted the composition of the rings, it remained for the spectroscope to give proof by actual observation. It is readily seen that were the rings solid a particle on the outside edge would have a higher linear velocity than one on the inside edge. On the contrary, were the rings made up of small particles, each free to move under gravitation then, by Kepler's third law, the inner ones would move faster than the outer. The spectroscope had so improved by 1895 that James E. Keeler at Allegheny Observatory was able to make the critical observations, and to prove that the inner edge moved faster, thus corroborating the theory. Keeler's actual measurements were, for the outer edge a velocity of about 10 miles per second, for the inner about 12 miles per second. The edges therefore revolve with velocities which small satellites would have at such distances from the planet. The velocity of the surface itself at Saturn's equator is 6.4 miles per second. With more powerful modern instruments the velocity of both inner and outer edges can be much more accurately determined. The density of particles in the rings varies: in *B* they must be fairly closely packed, and it is opaque. Ring *A* is partly transparent, tested by observing its transit over a star. Were there beings on Saturn to admire this strange appendage stretching across both day and night sky, they would have a phenomenon which for grandeur would have no equal in our solar system. The position of the Cassini division is not due to chance. Particles within it would have a period equal respectively to ½, ⅓ and ¼ the periods of the nearest three satellites. Evidently this is another resonance effect, so well known in the asteroid zone when certain even fractions of Jupiter's period are taken. Further, the boundary between rings *B* and *C* corresponds to the position of a particle whose period would be ⅓ that of Mimas. Otto W. von Struve proved that the total mass of the rings could not exceed 1/27,000 that of Saturn.

Saturn possesses nine satellites: the discovery of the tenth, to which the name Themis was given, has not been confirmed. The largest, Titan, was discovered by Huyghens in 1655; four more were found by Cassini in that century. Sir William Herschel discovered the two nearest the planet in 1789. The eighth was found in 1848 by George P. and William C. Bond at Harvard and William Lassell in Europe two days later. William H. Pickering discovered the ninth, by photography, in 1898. This is called Phoebe. Titan alone is larger than the Moon, being 2,600 miles in diameter, and 1.86 times as massive. It is the only satellite in the solar system on which traces of an atmosphere have been found. This was done by Gerard Kuiper in 1944 at the McDonald Observatory, University of Texas, using the great 82-inch reflector. Bands of methane were detected; ammonia was possibly present. The other satellites showed no traces of atmospheres, but it would not have been expected due to their much smaller masses. That Titan can hold an atmosphere while the four approximately equally massive satellites of Jupiter cannot is due to the fact that the Sun's heat at Saturn's distance is so much less, hence gaseous molecules have a lower velocity. Then a certain gravitational force on Titan could retain them while an equal force upon Jupiter's satellites could not. Eight satellites have direct motion; the outer one, Phoebe, has retrograde motion. This last is perhaps 150 miles in diameter and its period is 546 days, its orbit being inclined about 149° to the planet's equatorial plane. Seven of the other satellites lie almost in the latter plane, which is also that of the rings. The eighth alone, Iapetus, has an orbit inclined at 14°. As only Titan shows an appreciable disk, the diameters of the other satellites have to be estimated indirectly by means of their apparent brightness. This means that there is considerable uncertainty in the volumes and, as mass equals volume × density, the densities are also quite uncertain. As for the masses, in five of the nine cases they have been computed through perturbations; the results for the other four are less certain. However, using such data as we have, a density less than that of water is indicated for some of the satellites. It is very difficult to see how a body in the presumed condition of a satellite can have a density of less than one, namely, that of water. In the case of Phoebe, as for Jupiter's outer satellites, we might possibly think of captured nuclei of comets, but such an explanation would hardly

Name	Mean distance from Saturn in radii of planet	Periodic time d h	Discoverer	
Mimas	3.1	0 23	W. Herschel	1789
Enceladus	4.0	1 9	W. Herschel	1789
Tethys	4.9	1 21	J. D. Cassini	1684
Dione	6.3	2 18	J. D. Cassini	1684
Rhea	8.8	4 12	J. D. Cassini	1672
Titan	20.5	15 23	C. Huyghens	1655
Hyperion	24.8	21 7	W. C. Bond	1848
Iapetus	59.7	79 8	J. D. Cassini	1671
Phoebe	216.8	546	W. H. Pickering	1898

be tenable for the inner, more regular satellites. All nine seem to keep the same face towards Saturn. Iapetus, however, is five times brighter at western than at eastern elongation. This means probably an enormous difference in reflective power on opposite sides of its central meridian, because a body of its size, about 1,100 miles in diameter, would almost certainly be nearly spherical in shape. Five of the remaining satellites have been observed to vary slightly in brightness. The same explanation as that given for Iapetus would apply to them. The *American Ephemeris* and the *Nautical Almanac* give a diagram of the satellite system and full data as to their elongations, conjunctions, and other information necessary to identify them on any given date.

CHARLES P. OLIVIER,
Director, Flower and Cook Observatories, University of Pennsylvania.

SATURNALIA, the name of a Roman festival, instituted, according to the popular belief of the ancients, in commemoration of the happy period under the reign of Saturn, when freedom and equality prevailed, and violence and oppression were unknown. It originated probably as a harvest celebration. The festival continued at first one day; then three; afterward five; and finally, under the Caesars, seven days, namely, from the 17th to the 23d of December. At the commencement of this festival a great number of wax tapers were lighted in the temple of Saturn, as a sign that no more human victims were to be sacrificed. During its continuance no public business could be transacted, the law courts were closed, the schools kept holiday, to commence war was impious and to punish a malefactor involved pollution. The slaves were freed from restraint, wore caps as badges of freedom and went about dressed in tunics, adorned with purple, and in white togas. Masters and slaves changed places; and while the servants sat and banqueted at the tables, they were waited on by their masters and their guests, who, if they did not do this, were obliged to submit to all sorts of ridiculous punishments. Jests and freedom everywhere prevailed; and all ceased from their various occupations.

SATURNIAN VERSE, a metre employed by the earlier Roman poets. It consists of two members; the first an iambic dimeter catalectic, the other a trochaic dimeter brachy-catalectic. It points to the transition from the accentual versification of Etruria and Latium to the quantitive verse of fully developed Roman literature modeled as this latter was on Greek usage. It was originally employed in the hymns to Saturn sung at harvest time, hence its name; and it is also found in extant fragments of Naevius, Livius Andronicus, Ennius, etc. The basis of the metre is thus shown:

which corresponds with the metre of the old jingle,

There was a man in our town | wondrous wise and cunning.

The metre is met with in all primitive forms of European poetry, whether Spanish, German, or Anglo-Saxon, and is the underlying measure for almost all ballad literature.

SATYRS, săt'ẽrs or sā'tẽrs, in Greek mythology, a race of woodland divinities, who were followers of Dionysus (Bacchus), and represent the luxuriant vital powers of nature. They are not mentioned by Homer, but Hesiod describes them as a worthless race, unfit for work. They were supposed to be the sons of Hermes (Mercury) and Iphthima, or of Silenus. They appear in early works of art and poetry as robust in human frame with bristly hair, broad snub-noses, ears large and pointed like those of animals, two little horny knobs on their foreheads and a tail like that of a horse or goat. They are described as being fond of wine (whence they frequently appear with a wine cup or a thyrsus in their hands), and of every kind of sensual gratification, whence they are often represented sleeping, playing musical instruments, or engaged in voluptuous dances with nymphs. Like all the forest and field deities, they were greatly dreaded by mortals. By later writers, especially the Roman poets, the satyrs are confounded with the Italian Fauns, and are accordingly represented with larger horns and goats' feet, although they were originally quite a distinct class of beings. Ancient sculptors were fond of representing the satyr whether in his coarser or finer type—one of the most famous specimens of Greek art being the Satyr of Praxiteles, in which the revolting animal features of the conception have disappeared, and the satyr is portrayed as a beautiful and graceful youth.

SAUCONITE, a zinc-bearing clay from mines at Friedensville, Pa.

SAUDI ARABIA, a kingdom occupying most of the Arabian Peninsula. Approximately 865,000 square miles in area, Saudi Arabia is bounded on the north by Jordan, Iraq, and Kuwait; on the east by the Persian Gulf; on the south by various British protectorates and Yemen; and on the west by the Red Sea. Population estimates are unreliable, but perhaps the best (1950) are: total population, 3,500,000; Hofuf, 90,000; Mecca, 60,000; Riyadh (the capital), 55,000; Jidda 40,000; Medina, 30,000.

Topography.—A coastal plain averaging 25 miles in depth extends along the east coast. Inland, paralleling the plain and rising sharply, are the mountains of Hejaz, with an average elevation of about 4,000 feet. To the east is the central plateau which slopes gently toward the Persian Gulf, though it is broken by several escarpments. East of the escarpments is the Dahna sand belt which extends for 800 miles (average width 35 miles, average height 1,500 feet) and links the al-Nufūd Desert with the Empty Quarter. The area north of al-Nufūd is largely a southern projection of the Syrian Desert. East of the Dahna is a low plateau (average width 100 miles, average height 800 feet) which merges with the low-lying Persian Gulf coastal region. Of the great sandy deserts, which occupy more than one third of Saudi Arabia, the Empty Quarter (area 250,000 square miles), which is relatively unexplored and almost uninhabited, is the largest. Al-Nufūd, though much smaller (area 22,000 square miles), is its northern counterpart.

Natural Resources.—Deficient rainfall and lack of rivers have hampered vegetation in Saudi Arabia, but dates (a chief item in the diet), and a variety of grains, fruits, and vegetables are cultivated where water supplies are adequate. Scattered trees, including the tamarisk and the acacia,

are also found. Natural fauna include the gazelle, oryx, jerboa, wolf, fox, wildcat, jackal, monkey, bustard, hawk, and various lizards and snakes. Camels, sheep, horses, and donkeys are domesticated. The most important minerals are the oil of Hasa and the gold of Hejaz.

People.—The overwhelming majority of inhabitants are Arabic-speaking Sunnite Moslems, and there are almost no linguistic or religious minorities, although some oases in Hasa have Shi'ite majorities. Religiously the dominant force is Wahhabism (q.v.). The basic cleavage is that between sedentaries and nomads (Bedouins). The former are farmers or merchants; the latter are tribal herders, who, in a parched land, must move around, usually within traditional tribal areas, to find sufficient pasturage. There has not been any industrial class in the past, but the 17,000 employees (1950) dependent on the Arabian American Oil Company (Aramco) constitute the nucleus of one. Traditionally Bedouins and sedentaries have been hostile, despite the fact that most of the latter preserve tribal affiliations. There are, of course, social gradations within each group. The family is very closely knit; however, women are secluded and take no public part in affairs.

Government.—Prior to the conquest of Hejaz, Saudi affairs were handled patriarchically by the ruler, on whose absolutism Moslem law, unwritten tribal law, and custom are still the only checks. Thereafter, however, the complexities of administering the pilgrimage to the holy cities (Mecca and Medina, qq.v.) and fulfilling international obligations necessitated a more formal administration. Accordingly King 'Abd al-'Azīz II promulgated (Aug. 29, 1926) a "constitution" for Hejaz, according to which Hejaz was linked to Nejd through the king, sovereignty was vested in Moslem law, and governmental norms were based on early Islam. Administration devolved on a viceroy nominated by the king. Provision was made for a consultative legislative assembly, nominated by the king, as well as for local councils. The apparent dualism between Hejaz and Nejd was overcome partially by unifying them as Saudi Arabia in 1932. Nejd is administered by the royal court; the governor of Asir is supervised by the viceroy of Hejaz; Hasa is hereditarily governed by a collateral branch of the royal family. A month before his death 'Abd al-'Azīz II established the first Saudi cabinet, though reserving veto powers. Instead of the expected fragmentation at his death, improved communications and various developmental schemes have reduced separatist tendencies.

Economic Factors.—Before the discovery of oil Saudi economy was of a non-self-supporting type in which sedentary and nomad exchanged their specialties. Manufactured goods and some basic foodstuffs were imported. The greatest single source of income was the pilgrimage, which gave Hejaz economic as well as spiritual ascendancy over other provinces.

With an American company's discovery of oil in Hasa the situation changed radically. Not struck in commercial quantities until 1938, oil production has increased rapidly since then (1951: 850,000 bbls./day) and royalty payments have more than kept pace (1951: $125,000,000). Aramco, with proven reserves of nine billion barrels, is (1952) the world's largest producing company. Aside from royalties the country received approximately $10,000,000 in wages and other ramifications of the industry in 1951. Furthermore, Aramco stimulates independent contractors and conducts development schemes for the government.

The pilgrimage is still an important source of income, netting approximately $6,00,0000 annually in fees, transportational charges, and purchases. Taxes and duties account for perhaps 5 per cent of the total revenue, and several hundred thousand dollars accrue annually from Hejazi gold mines.

Communications.—The only functioning railroad is that from al-Dammām to Riyadh, completed in 1951. Surfaced roads are also deficient, being limited to Hejaz and Aramco's operational area in Hasa; unimproved tracks link other parts of the country. However, 9,000 motor vehicles were licensed in 1948. The important cities are served either by international or by Saudi Arabian airlines. Ocean vessels call at Ra's Tannūrah, al-Dammām, and Jidda. International telegraph services are available at Jidda, and both the government and Aramco maintain internal radio communications; there are two government broadcasting stations. Telephones were estimated to number 2,500 in 1946.

History.—Since its inception Saudi power has been based on a fusion of Wahhabism and Saudi family leadership. When Muḥammad ibn-'Abd al-Wahhāb (d. 1793), the founder of the puritan Wahhabi doctrines, began to advocate reform in his native Nejdi town, he was expelled, but Muḥammad ibn-Saud (r. 1744–1765), ruler of neighboring al-Dir'īyah, received the reformer. Politically the main concern of the two Muḥammads was expansion. Sometimes this was possible through conversion; in other cases force was necessary. Muḥammad ibn-Saud died in 1765 even before central Nejd was secured, but under his son, 'Abd al-'Azīz (r. 1765–1803) the state quickened its pace as follows: 1788, Nejd under control; 1789–1790, Hasa occupied; 1801, pillaging of Karbalā' in Iraq, Oman pays tribute; 1803, Mecca temporarily occupied.

Assassinated in 1803, 'Abd al-'Azīz was succeeded by his son, Saud (r. 1803–1814), who intensified the campaign against Hejaz, nominally under Ottoman control, and completed it in February 1806, when Mecca fell. By 1811 the empire controlled all the peninsula, save Yemen and Hadhramaut, as well as the steppe encircled by the Fertile Crescent. The situation, in fact, had become so alarming that the Porte ordered the Egyptian viceroy, Muḥammad 'Ali, to destroy the desert upstart. After a protracted struggle (1811–1818) the Egyptians, aided by the death of Saud (1814), succeeded. Saud's son, 'Abdullāh (r. 1814–1818), a less able commander, was captured and beheaded.

An Egyptian occupation, marked by growing resistance, continued sporadically until 1840, when international events forced its withdrawal. Among various members of the Saud family struggling to reconquer the country, Turki (r. 1823–1834) and his son Faiṣal (r. 1834–1838, 1843–1867) emerged victorious. After 1843 Faiṣal restored Wahhabi control in Nejd, Hasa, and Oman, but Hejaz reverted to Sherifian control until 1925. Moreover, Faiṣal's reign saw the rise of his vassals, the ibn-Rashīds of Ḥā'il, to semi-independence.

Faiṣal's death inaugurated a period of internecine warfare between his sons, 'Abdullāh and Saud, resulting in Ottoman occupation of Hasa

(1871) and the emergence of the ibn-Rashids as the chief power of inner Arabia. The greatest Rashīdi ruler, Muḥammad (r 1869–1897), brought all Nejd under his power by 1887 When Abdullāh died (1889) Saudi leadership passed to Faiṣal's third son, 'Abd al-Rahmān, but Saudi authority was completely eliminated in 1891, when he was forced to flee into exile with his young son, 'Abd al-'Azīz.

'Abd al-'Azīz and his father settled in Kuwait, where the young man nourished the ambition of restoring his patrimony. This ambition was rewarded when on January 16, 1902 he and a small hand-picked force captured Riyadh. Ibn-Rashīd, preoccupied by a campaign against Kuwait, delayed action until autumn. When he finally moved, ibn-Saud, as he became known, defeated him. Indecisive hostilities continued for the next four years, but in April 1906 Rashīdi power, as an active threat to the new Saudi state, was broken by a decisive Saudi victory, in which ibn-Rashīd was killed. His successors were thereafter confined to northern Nejd, leaving the center and south to ibn-Saud.

In June 1912, ibn-Saud gave some ground to the Meccan Sherif, Hussein, in order to gain time for dealing with Bedouin unrest. His answer to the Bedouin problem was the *Ikhwān* (brethren) movement, whereby he settled Bedouins in fixed communities, hoping thus to acquire a military force loyal to state instead of tribe. He also increased Wahhabi propaganda.

On the eve of World War I, ibn-Saud took another step forward by conquering (April 1913) Hasa from the Ottomans. Coming thereby into close contact with the British, he encouraged them vis-à-vis the Turks, who supported his Arabian enemies. On December 26, 1915 the situation constrained him to sign an agreement which in effect established a British protectorate over his dominions, for it granted him a British subsidy and made negotiations with other powers conditional on British consent. The Wahhabi state took little active part in the war, especially after June 1916, when Sherif Hussein's revolt against the Turks gained him generous British support.

In 1919 the uneasy wartime Arabian truce was broken by Hussein, who attacked the western edge of Wahhabi territory. His army was destroyed, thus opening the way to Mecca, but ibn-Saud contented himself with slight territorial gains. However, he soon acquired other territories. In 1920 he annexed the inland districts of Asir and in the following year conquered the Rashīds for good. The last victory was consolidated in 1923 by occupying other districts north and west of Ḥā'il.

A decision between ibn-Saud and Hussein was not long postponed despite British mediation. The immediate spark was Hussein's presumptuous assumption of the caliphate in March 1924. Hostilities began in September with the fall of al-Ṭā'if to a Wahhabi detachment. Hussein's army tried to halt the Wahhabis between al-Ṭā'if and Mecca, but was defeated and retired to Jidda. The Meccans then forced him to abdicate in favor of his son, 'Ali, and surrendered without resistance. The rest of the war consisted mainly of siege operations, in which starvation was the chief Saudi weapon. Medina capitulated on December 5, 1925. 'Ali abdicated on the 19th, and four days later ibn-Saud entered Jidda. With the conquest of Hejaz, ibn-Saud's expansion was almost complete. In 1926 lowland Asir, previously independent, was added to his realm by treaty. In 1934 a boundary dispute caused war between Saudi Arabia and Yemen. Ibn-Saud won, but with characteristic tact only occupied the disputed territory. His most serious internal crisis was in 1928 when he had to contend with a revolt of the Muṭair and 'Utaybah tribes.

Ibn-Saud's growing power brought him international recognition. On May 20, 1927 a treaty between Britain and Hejaz annulled the agreement of 1915 and declared the absolute independence of ibn-Saud. Other countries followed suit.

Since 1934, Saudi Arabia has known only peace and security. During World War II she played no active role, but the king's staunch loyalty to the Allies was a real factor when the issue hung in the balance. In the international field Saudi Arabia is a charter member of both the United Nations and the Arab League. The founder of modern Saudi Arabia died Nov. 9, 1953, and was succeeded by his oldest living son, Saud. Aramco has put into effect development projects which are changing the whole face of the country. The most important are: increased supplies of water for irrigation; installation of municipal water supplies; experimental farms; extension of educational and medical facilities; new piers at Jidda and al-Dammām to eliminate lighterage; and electrification of Jidda, Mecca, and Riyadh. Further, a whole new field for private enterprise is opening, wherein new enterprises include: construction, transport, tanning, and power companies; brick, textile, soap, ice, and cement plants; machine and carpentry shops; service stations; hotels; laundry and dry cleaning establishments; cold-storage plants; chicken farms; and a bank. These novelties may create tensions in the future, but Saudi Arabia has made a definitive break with the past.

Department of Oriental Languages and Literatures, Princeton University.

SAUGER, or **SAND PIKE**, a fish of the rivers and lakes of the northern Mississippi Valley, a pike-perch of the genus *Stizostedion*, and hence a relative of the wall-eyed pike. The sauger (*S. canadense*) is much smaller than the wall-eyed pike, seldom more than 18 inches long and one to two pounds in weight. It varies in quality and estimation both as food and as a game fish, but in some tributaries of the upper Mississippi affords good sport by trolling over ripples with a minnow. Its color is olive gray, the sides grassy or orange with dark mottlings, round black spots on the dorsal fins and a large black blotch on the base of the pectoral fin.

SAUGERTIES, sä'gėr-tĭz, N. Y., village in Ulster County, alt. 100 feet; on the west side of the Hudson River at the mouth of Esopus Creek; on the West Shore Railroad; by rail, 100 miles north of New York City, 11 miles north of Kingston. The surrounding country is agri-

cultural, with mountains back from the river. Nearby are quarries of bluestone and limestone; Saugerties was at one time an important shipping point for these stones. It was also an important port of call in river traffic. Papermaking is the village's principal industry. Several plants engage in the manufacture of women's dresses and waterproof goods.

History.—Saugerties was settled in the early 1700's, and incorporated in 1831. The name is said to come from the Dutch "de zaagertzje's," meaning "the sawyer's," and was applied to a man who owned a sawmill on the site before 1700. Several houses in the village date back to the 18th century; the Kiersted house, for example, was built in 1727. The government is administered by a mayor and board of 6 trustees. Pop. (1940) 3,916; (1950) 3,907.

SAUGUS, sâ'gŭs, town, Massachusetts, in Essex County, altitude 20 feet; 10 miles northeast of Boston; on the Boston and Maine Railroad. It is a residential town with few industries. The first successful iron works in America was established here in 1644. It is now being restored by the Steel Institute as the birthplace of the industry in America. Many of the original foundations have been located by archaeological excavations. Among these are the blast furnace, portions of the old water wheel, the refinery and the 500-pound hammer. The Old Ironworks House (1643) has a framework of English oak timbers brought over by the builder. The town, originally called Hammersmith, was settled in 1630 and incorporated in 1815. Pop. (1940) 14,825; (1950) 17,162.

SAUL, first king of Israel from about 1040 B.C. He was the son of Kish, a wealthy and powerful Benjamite, was noted for his personal beauty and courage; and when the people became dissatisfied with the theocratico-republican constitution, was selected by Samuel for their king. He was not acknowledged by the whole people until after he had gained a victory over the Ammonites. Repeated successes over the Philistines, Edomites, Moabites, Ammonites, and even over a king beyond the Euphrates, confirmed his authority. But Samuel, offended by the encroachments of the king on the privileges of the priesthood, and by his disobedience to the commands of Jehovah in a war against the Amalekites, secretly anointed David as king. His reign was terminated by a catastrophe. A battle was fought against the Philistines at Mount Gilboa; the Hebrews fled, Jonathan and two other sons of Saul fell and the king slew himself with his own sword. David, whose skill in poetry equalled his musical genius, honored in a touching elegy the memory of his fallen friends and foes (II Samuel 1), who, "lovely and pleasant in their lives, were even in their death not divided; they were swifter than eagles, they were stronger than lions."

SAUL. This "dramatic lyric" by Browning, one of the most popular of his poems, is founded on I Samuel 14:14-23, which tells how David by playing upon his harp exorcized the king's evil spirit. The first nine stanzas of *Saul* were published in 1845; to these were later added seven stanzas, and the entire poem was published in 1855. Its noble and inspiring outlook on life, its profound emotional appeal, its fine imagery, its dramatic quality and the vigorous rush of its verse, place *Saul* among the most remarkable of English lyrical poems. David is the speaker. As he and his friends are tending their sheep in the morning, he tells the story of the night when he sang and played before Saul. He finds the king in his tent, apathetic and almost unconscious. Saul must be aroused, made to feel the joy of life, quickened to a sense of his own personal worth. First, David plays the tunes to which the wild animals respond—the quail, the crickets, the jerboa; then, the tunes associated with simple human customs, the reaping, burying, marrying and worshipping. Saul begins to respond. David then sings the joy of living, of "our manhood's prime vigor" and of Saul's great place in the world. The king's spirit is roused; but the harpist must lead him far higher. So he sings of fame after death, of the place Saul shall hold in the memory of generations yet unborn; finally, of immortality and love, and of the Christ as the living embodiment of man's highest longings. Saul is restored. As the singer hastens homeward through the night, he receives nature's own attestation of the new law of love. Much of Browning's philosophy of life is embodied in *Saul,* which contains ideas that also find expression in others of his shorter poems, notably in *Abt Vogler* and *Rabbi ben Ezra.*

MARION TUCKER.

SAUL, a Biblical tragedy in five acts, by Vittorio Alfieri (1749–1803), is generally regarded as his masterpiece. It is written in blank verse, or, rather, in unrhymed hendecasyllables, broken and varied, thus avoiding the monotony of the French Alexandrine verse which the author disliked. Alfieri, as he relates in his *Vita* (Autobiography, Epoca IV, Cap. 9), had been reading with intense interest the Bible during a quiet stay in Rome (1782–1784), and had his imagination enkindled by the fierce struggle between two opposite passions in the breast of Saul. Thus the idea of the tragedy came to him on March 30, 1782; and by July 30 the play was finished. Alfieri would have dedicated *Saul* to Pope Pius VI (Jean-Ange Braschi), but His Holiness thought it would be unbecoming to be associated in any way with a theatrical production. (*Vita,* 1783).

The tragedy was first performed in Florence, in 1793, by amateurs, in a private house before a small audience, with good success. *Saul* is representative of Alfieri's genius, and has had the most constant success of all his tragedies on the stage. The superb tragic elements in the Biblical story have long made it a favorite for treatment by poets, sculptors, painters and musicians—witness *Saul le furieux* of Jean de la Taille, the *Saul* of Voltaire, and of A. Soumet, in France, of Paul Heyse and J. G. Fischer, in Germany, and of Aaron Hill, in England, and of Charles Heavysege, in America.

In extreme simplicity of structure *Saul* is like the author's other tragedies yet is less austere, in that humanity here reveals itself more pleasingly. While Alfieri sympathized with Saul in his conflict with the priesthood, that struggle does not form the main interest of the play; nor is David, the instrument of God, at all like the tyrants who represent the opposition in most of Alfieri's tragedies, but on the contrary he grows throughout the plays in nobility, loyalty and tenderness. Saul, a prey to conflicting emotions, perishes not because of his crimes or passions, but through remorse, intensified by the terror which has taken posses-

sion of his soul. The *Song of David* in the third act is one of the gems of Italian lyric poetry. A useful edition of *Saul,* well annotated, is that of Mario Menghini (Florence 1893).

JAMES GEDDES, JR.

SAULSBURY, Willard, American lawyer and legislator: b. Georgetown, Delaware, April 17, 1861; d. Feb. 20, 1927. He was educated at the University of Virginia, was admitted to the bar in 1882, and until his death practiced in Washington. He came of a family prominent in Democratic political circles in Delaware, was delegate at large from Delaware at the Democratic National conventions in 1896, 1904, and 1912. He was United States senator in 1913–1919, afterward returning to private life. He consolidated the street and electric railroads of Wilmington, and was director in various banks and trust companies.

SAULT SAINTE MARIE, city, Michigan, and Chippewa County seat; altitude 607 feet; on St. Marys River and on the Sault Sainte Marie Ship Canal, between Lakes Superior and Huron; 502 miles northeast of Minneapolis, Minn.; on the Canadian Pacific; Minneapolis, St. Paul and Sault Ste. Marie (Soo Line); and Duluth, South Shore and Atlantic railroads; has airline service. It is a port of entry in the 38th customs district. The city has ferry service to the city of the same name across the river in Ontario; and here a railroad bridge spans the river. The Michigan city is surrounded by an agricultural area, in which dairying and stock raising are carried on; its industries are concerned with leather and carbides, woolen goods, and beverages; and there are fisheries. There are also lumber yards and warehouses, and facilities for ship construction and repair. Hydroelectric power is developed from the descent of the river which drops 20 feet in one mile. The locks in 1948 took care of 113,523,588 tons of freight; it is said that more tonnage passes through Saint Marys Locks than through the Manchester, Suez and Kiel Canals combined. (See SAULT SAINTE MARIE CANALS.)

The city of Sault Sainte Marie has a Carnegie public library, and a marine library, good public schools, churches of many denominations, a county hospital. There is also a community building, a municipal tourist camp, two parks, and a high school athletic field. A point of interest is the home of Henry Rowe Schoolcraft (q.v.), the American ethnologist and Indian student, who had headquarters here in the 1820's. The locality has a romantic place in United States and Canadian history; and even before that it must have been a well known passing point on Indian trails. Etienne Brulé landed on the site in 1618 when Champlain sent him to find a Northwest Passage. Other explorers followed, and the Jesuits established a mission here in 1668 under Father Jacques Marquette. The French held a great council of the Indians here in 1671, and proclaimed France as owner and ruler of all the lands south to the Gulf of Mexico and west to the Pacific Ocean. The Stars and Stripes first flew over the settlement in 1820 when Gov. Lewis Cass (q.v.) claimed the region for the United States. The city was incorporated in 1887. It has commission-manager government. Pop. (1940) 15,847; (1950) 17,912.

SAULT SAINTE MARIE, city, Ontario, Canada, in the Algoma district on the St. Marys River through which Lake Superior empties into Lake Huron and which here constitutes the boundary between Ontario and northeastern Michigan. The historic "sault" above the city—barrier to the early fur trade—has a drop of 20 feet in less than a mile. Opposite the Canadian city is its still more historic namesake the city of Sault Ste. Marie the oldest site of settlement in the state of Michigan. The two are connected by a mile-long international bridge and by ferry service. The port of Sault Ste. Marie handles a considerable local trade, the number of arrivals in the coasting service being 380 in 1950 and in the service 554; coal and iron ore were the chief foreign products unloaded, and pig-iron and coke the chief products loaded for foreign destination.

History.—As the meeting place of the three largest of the Great Lakes, the neighborhood of Sault Ste. Marie was frequented from the earliest times by the Indians attracted by the lake fisheries, and by the explorers, fur-traders and missionaries of New France, including among the latter such famous names as Brulé and Nicolet, Jogues and Raymbault, Marquette and Joliet, La Salle, Radisson, and Groseilliers. There was a mission on the American side of the river as early as 1641, and a permanent settlement as early as 1662. The North-West Fur Company established a post on the Canadian side in 1783 and built a lock around the rapids in 1797–1798, which was destroyed in 1812. Sault Ste. Marie became the center of the Algoma district in 1858, was incorporated as a town in 1887 and as a city in 1912. Pop. (1941) 25,794; (1951) 32,273.

SAULT SAINTE MARIE CANALS, sōō′ sānt mȧ-rē′, or French sō sănt mȧ-rē′ (also ST. MARYS FALLS, or "Soo," CANALS). The St. Marys River, 63 miles long, is formed by the flow of water from Lake Superior to Lake Huron; the level of the former being 23 feet higher than the latter. This river is the boundary between Ontario, on the north and east, and the Upper Peninsula of Michigan, on the south and west.

The early trappers and traders of the northwest found that the sault, or falls (actually rapids), of the St. Marys, where the descent is about 18 feet in one mile, made free navigation impossible and forced them into portaging the ever-increasing cargoes of furs and merchandise at this point, about 49 miles above the river's mouth. Finally the Northwest Fur Company constructed a canal with a single lock on the Canadian side. This lock, built in 1797–1798, was 38 feet long, 8 feet 9 inches wide, with a lift of 9 feet. The canal was in use by canoes and bateaux until 1814, when all but the timber floor and sills of the lock were destroyed by United States troops during the War of 1812.

No further attempts at canal building in this remote spot were made until 1853, when a ship canal—the first within the borders of the United States—was begun by the State of Michigan on land granted by the federal government. It was completed in 1855. The length of this canal was 5,674 feet, and it was provided with two locks in tandem, each being 350 feet long and 70 feet wide, with 11½ feet of water on the sills and a lift of 9 feet. The original cost was $999,802.

Tolls, starting with six and a half cents per registered ton and being gradually reduced to two and a half cents, were collected until 1881, when

the canal was transferred to the federal government, on June 9. In 1870 with the consent of the state, the federal government had begun to enlarge the canal, and by 1881 had increased its length to 1.6 miles, its width to an average of 160 feet, and its depth to 16 feet. Another lock, the Weitzel Lock, located 100 feet south of the state-built locks, was completed in 1881. This single lock was 515 feet long, 80 feet wide (60 feet at the gates), and had a depth of 17 feet on the sills. The cost was $983,335.

In 1888 the state-built locks were torn down and replaced by the Poe Lock, 704 feet long, 95 feet wide in the chamber, with 21 feet of water on the sills. The Poe Lock was completed at a cost of $2,837,337, and was opened in 1896.

A Canadian canal was opened in 1895. This is 1.4 miles long, 150 feet wide, and 22 feet deep, with a lock 900 feet long, 60 feet wide, with 22 feet of water on the miter sill. The Canadian canal is also toll-free. See CANADIAN CANALS.

The third and fourth locks on the United States side are the Davis and the Sabin, which were built in 1907–1919. These locks have the same dimensions, 1,350 feet long, 80 feet wide, with 23 feet of water on the miter sills at low-water datum. Their combined cost was $4,680,700. A separate and free waterway was also constructed to feed these locks.

In 1942 the Weitzel Lock was torn down to make way for the MacArthur Lock, which was opened in 1943. The MacArthur Lock cost about $12,706,000, and is 800 feet long, 80 feet wide, with 31 feet of water on the miter sills at low-water datum.

Beginning with a congressional appropriation of $100,000 in 1856, large sums have been spent on deepening and widening the channel, eliminating short turns, and on other measures to permit the passage of larger ships and to speed their transit. As a result 47 miles have been dredged, with a minimum width of 300 feet for one-way traffic and 600 feet for two-way traffic. The channel for traffic to Lake Superior has a minimum depth of 21 feet; the channel to Lake Huron, 25 feet.

It is not generally realized that the Sault Sainte Marie canal system, considered in terms of the traffic carried, in net tons, is the most important waterway in the world; exceeding the Suez, Panama, and Kiel canals combined. Bulk cargoes, which can be most cheaply transported by water, are naturally the leading source of traffic. Iron ore and grain, destined for the industrial centers of the United States and Canada, have long been the staples of the trade from Lake Superior, although petroleum, brought by pipeline from Canadian fields to the shores of the lake, has assumed a considerable importance. The traffic from Lake Huron consists chiefly of coal, other bulk goods, and general merchandise.

SAUMAREZ, sō'mà-rĕz(?), sō-mà-rā'(?), **James,** BARON DE SAUMAREZ, British naval officer: b. St. Peter Port, Guernsey, March 11, 1757; d. Guernsey, Oct. 9, 1836. He entered the navy in 1770 and served in America during the Revolutionary War. He was raised to the rank of commander after distinguishing himself in the engagement with the Dutch on Dogger Bank, Aug. 5, 1781, and was captain of the *Russell* in Admiral George Rodney's victory over the French off Dominica, April 12, 1782. In 1793 he was knighted for the capture of the French frigate *Réunion.*

In March 1795 Saumarez was appointed to the command of the *Orion,* which took part in the battle with the French off L'Orient on June 23 and the victory over the Spanish fleet off Cape St. Vincent, Feb. 14, 1797. He was senior captain under Horatio Nelson in the same ship at the Battle of the Nile, Aug. 1–2, 1798. In 1801 he was made rear admiral, created a baronet, and appointed to the command of a squadron cruising off Cádiz. Driven off with the loss of a ship in an attack on French ships at Algeciras, July 6, 1801, he routed the latter and a Spanish squadron at sea on July 12. He was made vice admiral in 1807 and from 1809 to 1813 commanded a squadron in the Baltic. He was made admiral in 1814 and in 1831 was created baron de Saumarez.

SAUMUR, sō-mür', commune, France. It is situated in the Department of Maine-et-Loire, 28 miles southeast of Angers, on the Loire, with a suburb on an island in that river. Saumur is noted for the French Army cavalry school located on its northwestern outskirts in 1768. The town grew up under the protection of the château of the counts of Anjou on a prominence above it. This castle was built in the 11th–13th centuries, but was much altered in the 16th. The town has several churches dating from the 11th and 12th centuries, although subsequently altered or added to; its town hall dates from the 16th century, and there are numerous houses from the 15th to 17th centuries.

Saumur became a Protestant stronghold in the 16th century, and declined after the revocation of the Edict of Nantes in 1685, when many inhabitants emigrated. About a third of the town was destroyed in 1940, when the cavalry school cadets resisted the German invasion. Manufactures include sparkling white wines, jewelry, and machinery. Pop. (1946) 17,635.

SAUNDERS, sän'dĕrz, **Alvin,** American public official: b. Fleming County, Ky., July 12, 1817; d. Omaha, Nebr., Nov. 1, 1899. He moved with his parents to Illinois in 1828, and at 19 went to Iowa, where he later became postmaster at Mount Pleasant. In 1846 he was a member of the convention which framed the constitution under which Iowa was admitted to statehood, and in 1860 was chairman of that state's delegation to the Republican convention which nominated Lincoln for the presidency. Saunders was appointed governor of the Territory of Nebraska by Lincoln in 1861 and retained that post until 1867, when the territory was admitted as a state. He served as United States senator from Nebraska from 1877 to 1883.

SAUNDERS, SIR **Charles Edward,** Canadian wheat expert: b. London, Ontario, Feb. 2, 1867; d. Toronto, July 25, 1937. He was the son of William Saunders, founder of the Dominion experimental farms. He was educated at the University of Toronto and at Johns Hopkins University, and in 1903 was appointed Dominion cerealist at the experimental farms of Ottawa, retaining a connection with the Dominion experimental farms until his retirement in 1922. During this period, as one of a group originally directed by his father, he discovered the Marquis, Ruby, Garnet, and Reward varieties of wheat. Saunders was elected a fellow of the Royal Society of Canada in 1921 and in 1925 was awarded the society's Flavelle Medal. He was knighted in 1933. Saunders was the author of *Essais et vers* (Montreal 1928), as well as of reports and bulletins in official and

other publications. He was made officer of instruction by the French government and was awarded the French Academy Medal. He was a fellow of the Royal Society of Canada.

SAUNDERS, Richard, the name under which Benjamin Franklin published his 'Poor Richard's Almanac' (1732–57).

SAUNDERS, Thomas Bailey, English author: b. Cape Colony, 2 Dec. 1860; d. 8 Feb. 1928; was educated at King's College, London, and at University College, Oxford, became a barrister in 1886 and then engaged in literary work. He first made translations of much of the work of Schopenhauer and Goethe and has written 'Life and Letters of James McPherson' (1893); 'The Quest of Faith' (1899); 'Prof. Harnack and His Oxford Critics' (1902); 'Schopenhauer' (1901), etc.

SAUNDERS, William, Canadian agriculturist, pharmacist and entomologist: b. Devonshire, England, 16 June 1836; d. 13 Sept. 1914. He accompanied his parents to Canada in 1848 and became a manufacturing chemist at London, Ontario. Becoming extensively interested in agriculture, he made a study of soils and insect pests, and did much to further the development of scientific agriculture in Canada. He was professor of materia medica at Western University in 1882–85 and public analyst for western Ontario in 1882–86. He was one of the founders of the Ontario College of Pharmacy and served as its president for two years. In 1885, under government direction, he investigated agricultural experiment work in the United States and Europe, his report resulting in the establishment of the Canadian experiment farms, of which he was in charge in 1886–1911. He was a founder of the Ontario Entomological Society, and was one of the original fellows of the Royal Society of Canada, of which he was president in 1900. Author of 'Insects Injurious to Fruit' (1882; 2d ed., 1898).

SAUNDERS, William Lawrence, American engineer and inventor: b. Columbus, Ga., 1 Nov. 1856. He was graduated at the University of Pennsylvania in 1876, and in 1878–81 he was with the National Storage Company at Communipaw, N. J. He was afterward president of the Ingersoll-Sergeant Drill Company and an officer in other companies manufacturing tools and machinery. He invented a compressed air system of pumping liquids; a drill for use upon submerged rocks, and the Ingersoll track and bar channelers for quarrying stone. In 1915 he was appointed to the United States Naval Advisory Board and subsequently became its chairman. Author of 'Compressed Air Information' (1903); 'Compressed Air Production,' and joint author of 'Subways and Tunnels of New York.' Died, 25 June 1931.

SAUREL, a fish. See SCAD.

SAURIA, sâ'rĭ-ạ, a term variously applied in the classification of the reptiles, but in this work restricted to designate the subclass composed of the orders *Lacertilia* (lizards) and *Ophidia* (serpents). In popular speech the phrase "saurian reptiles" usually means alligators or crocodiles. See REPTILES.

SAURIN, Jacques, zhäk sō-răñ, French Protestant preacher: b. Nimes, 6 Jan. 1677; d. The Hague, 30 Dec. 1730. After study at Geneva he became pastor in 1701 of a Walloon congregation in London, but in 1705 went to The Hague to take charge of a church of French refugees assembling there in a chapel of the Prince of Orange. Here his pulpit oratory was so greatly admired that it roused the bitter envy of his clerical brethren, who charged him with heresy and subjected him to a series of petty persecutions which shortened his life. His doctrines were those of moderate Calvinism. As a pulpit orator he has been likened to Bossuet, and so far as vigor of presentation goes this may be thought just. He was the author of 12 volumes of 'Sermons,' selections from which were translated into English, and published between 1775 and 1784 in five volumes (with a 'Memoir'), a sixth being added in 1796. Among his other works are 'Etat du Christianisme en France' (1725); 'Abrégé de la théologie et de la morale Chrétienne' (1722); 'Discours sur les evénements les plus mémorables du vieux et du Nouveau Testament' (1720–28). Consult 'Life' by Berthault (1875).

SAUROPODA, sâ-rŏp'ō-dạ, a sub-order of dinosaurian reptiles which included gigantic forms, such as *Brontosaurus, Morosaurus, Diplodocus* and the like. (See DINOSAURIA). It is difficult, remarks Gadow, to understand how these huge, long-necked *Sauropoda* lived and moved about. The long neck suggests at first sight predaceous habits, but the teeth, rather feeble in *Diplodocus,* and distinctly of the plant-cutting type in other genera, put this out of the question. The high position of the impaired nasal opening, and the shortened nasal bones of *Diplodocus* are features indicative of aquatic habits, but the short-toed plantigrade limbs are absolutely adapted to terrestrial life, and we cannot well assume that such enormous brutes as *Atlantosaurus* could possibly have ventured into swampy ground.

SAUROPSIDA, a primary division of vertebrated animals, comprising the reptiles and birds, the other two corresponding divisions being the *Ichthyopsida* (fishes and amphibians) and the *Mammalia.* These divisions, set apart by Huxley, are in accordance with genetic relationships. For the similarities in structure between birds and reptiles, showing descent from a common sauropsidan ancestor, see ORNITHOLOGY; REPTILES.

SAURURÆ, the name given by Huxley to an order of the class of birds (see ORNITHOLOGY), constructed for the reception of *Archæopteryx* (q.v.), a fossil bird, the oldest and most primitive bird-fossil known, remarkable for its lizard-like tail.

SAURY-PIKE, or **SKIPJACK,** a fish (*Scomberesox saurus*), having a greatly elongated body covered with minute scales and the jaws prolonged into a long sharp beak. It is about 15 inches long, occurs plentifully on the north Atlantic coasts, frequenting inlets in shoals so dense that it may be taken in pailfuls. In order to escape the pursuit of the porpoise and large fishes it often leaps out of the water or skims rapidly along the surface. Consult Goode, 'American Fishes' (1888).

SAUSAGE, an article of food consisting of minced meat, highly seasoned, and enclosed in synthetic casings usually of cellulose.

Among the Romans the sausages of Lucania were held in high repute; they were made of fresh pork and bacon finely minced with nuts of the stone-pine, and flavored with pepper, cummin seed, bay leaves, pot-herbs and garum. The Bologna sausages of Italy are still highly prized; they consist of veal, salt beef, salt pork and bacon, finely chopped up, seasoned with sage, mixed herbs, ground pepper and mixed spice. The smoked sausages of Germany are also considered as a delicacy by many; they are made of fat and lean pork preserved for about a week by salt, saltpetre, black pepper and alspice being rubbed into the meat; it is then cut small and mixed with some shreds of shallot or garlic, pressed into an ox-skin, wrapped in a fold or two of muslin and then smoked in the same way as ham. The pork sausages of our own country are made and seasoned in various ways to please different palates. See MEAT PACKING; MEATS AND MEAT PRODUCTION.

SAUSSURE, sō-sūr, **Horace Bénédict de,** Swiss savant: b. Conches, near Geneva, 17 Feb. 1740; d. Geneva, 22 Jan. 1799. He began his studies in natural science in Geneva and at 22 was appointed professor of philosophy. Later he was elected member of the Council of Two Hundred in the new legislature of his country. His name has since become famous from his services to geology, geodesy, the geographical distribution of plants and the applied sciences. His most remarkable work was done in the investigation of plant anatomy. In pursuit of his chosen studies he traveled through France, Holland, England, Italy and Sicily; thoroughly exploring the Alps, especially the glaciers of Chamounix, and was the first to reach the summit of Mont Blanc (1787) and to measure its height by barometric pressure. He is also the inventor of the electrometer, hydrometer and similar instruments. As founder and president of the Society of Arts of Geneva he did good service to the industries of that city. Among his writings the most important are 'Voyages dans les Alpes' (1779) and 'Partie Pittoresque' (1890).

SAUTERNE, sō-tĕrn', a white Bordeaux wine of high repute, produced from grapes grown in the neighborhood of Sauternes, a village in the department of Gironde, near Bordeaux.

SAUVEUR, sō'vėr, **Albert,** American metallurgist: b. Louvain, Belgium, 21 June 1863. He studied at the Liége School of Mines, and, coming to the United States, was graduated at the Massachusetts Institute of Technology in 1889. He was chemist and metallurgist in different steel works until 1897; and in 1897–1905 he owned and directed the Boston Testing Laboratories. He lectured on metallurgy at the Massachusetts Institute of Technology in 1898–1903; was connected with the Harvard University faculty from 1899; in 1905 he became professor of metallurgy there; and from 1924 he held the Gordon McKay professorship at Harvard University. In 1917 he became metallurgist with the American Aviation Commission in France and also served at that time as metallurgical expert for the French Ministry of Munitions. He edited the *Metallographist* in 1898–1903 and the *Iron and Steel Age* in 1903–06. Author of 'Metallography of Iron and Steel' (1912); 'Germany and the European War' (1915). D. 26 Jan. 1939.

SAVAGE, Edward, American portrait painter and engraver: b. Princeton, Mass., 26 Nov. 1761; d. there, 6 July 1817. He was a goldsmith and engraver in early life, but eventually turned to portrait painting, and established his reputation through his portraits of Washington, who sat for him several times, and of whom he in 1790 finished the portrait painted as a gift to Harvard. He studied abroad in 1791–94, under West in London and later in Italy. On his return to the United States he established a studio in Philadelphia and later painted in New York, maintaining there for many years an art gallery. He painted portraits of Thomas Jefferson, Anthony Wayne, Knox and other famous persons; finished R. E. Pine's 'Congress Voting Independence' (Philadelphia Historical Society), and executed 'Family Group at Mount Vernon' (1796), as well as making many steel engravings of his own portraits.

SAVAGE, Henry Wilson, American theatrical manager: b. New York, 1859; d. Boston, Mass., 29 Nov. 1927. He was graduated at Harvard University in 1880 and afterward engaged in the theatrical business. He was president of the Henry W. Savage Company; built Castle Square Theatre in Boston; and was director of the National Association of Theatrical Producing Managers of America.

SAVAGE, James, American antiquarian: b. Boston, Mass., 13 July 1784; d. Boston, 8 March 1873. He was graduated from Harvard in 1803, studied law, was admitted to the bar, served in both branches of the legislature and then retired from political life to engage in literary work. He published numerous historical and political pamphlets and edited many works concerning New England history. His work is unfortunately marred by a partisan spirit and is somewhat confused in plan. He wrote 'Genealogical Dictionary of the First Settlers of New England, showing three Generations of those who came before May 1692' (4 vols., 1862–64), and edited Winthrop's 'History of New England' (1825–26); Paley's 'Works' (5 vols., 1828), etc.

SAVAGE, Minot Judson, American Unitarian clergyman: b. Norridgewock, Me., 10 June 1841; d. 22 May 1918. He studied at Bowdoin College, and thereafter was graduated from Bangor Theological Seminary in 1864 and for three years (1864–67) was a Congregational home missionary, in California. There he established churches in Grass Valley and San Mateo. He occupied Congregational pulpits in Framingham, Mass., and Hannibal, Mo. (1867–69), (1869–73). Becoming a Unitarian he was made pastor of the Third Unitarian Church in Chicago (1873–74), and a year later became pastor of the church of the Unity, Boston, where he remained for 22 years. In 1896 he became pastor of the church of the Messiah, New York City, resigning the pastorate in May 1906. He represented the more radical element of his denomination and was the first clergyman who accepted "evolution." He was a voluminous writer upon ethical and religious subjects. Among his many books are 'Christianity the Science of Mankind' (1873); 'The Religion of Evolution' (1876);

'Social Problems' (1886); 'My Creed' (1887); 'Religion of To-Day' (1897); 'Our Unitarian Cause' (1898); 'Life Beyond Death' (1901); 'Life's Darkest Problems' (1905); 'The Passing and Permanent in Religion' (1901).

SAVAGE, Richard, English poet: b. London, 10 Jan. 1698 (?); d. Bristol, 1743. He claimed to be the illegitimate son of Anne, Countess of Macclesfield, by Richard Savage, Earl Rivers, but was probably the son of a woman who had been employed to nurse a natural son of the countess by that earl. This child, according to the countess, died when quite young, and she declared that Savage was an imposter. Savage was apprenticed to a shoemaker, having probably received some education at a grammar school near Saint Albans. He turned to literature and became an author as a means of livelihood. His first work, a pamphlet on the Bangorian controversy, was followed by two comedies, 'Woman's a Riddle,' performed in 1716, and 'Love in a Veil.' These procured him the acquaintance of Sir Richard Steele and Wilkes, the actor. His tragedy, 'Sir Thomas Overbury,' was brought out in 1723, the author himself playing the leading part, but with little success. Savage was rising in reputation when, in 1727, he killed a man in a tavern brawl. He was tried and sentenced to death, but through the influence of Lady Hertford was pardoned. In 1728 appeared 'The Bastard,' a poem of some merit. Soon after Lord Tyrconnel (a nephew of his alleged mother) received him into his house and allowed him £200 a year. In 1729 he published 'The Wanderer: a Moral Poem.' A quarrel with his patron once more turned him adrift upon the world. A birthday ode addressed to Queen Charlotte in 1732 procured him a pension of £50 from the queen. In 1735 a satire against the clergy, entitled 'Progress of a Divine,' caused a prosecution to be instituted against him; but the information was dismissed. From this period he appears to have sunk into the lowest misery. The death of the queen and the loss of his pension completed his ruin, although Pope and a few friends raised a subscription with a view of enabling him to reside in Wales. But at Bristol he was arrested for debt and thrown into the county jail, where, after a detention of some months, he died. Besides the works above mentioned he was the author of much occasional verse and other miscellaneous writings. Savage was the friend and companion of Samuel Johnson at the time when the latter was sleeping in the streets of London houseless and penniless. Consult Johnson, 'Life of Savage' (1744); Galt, 'Lives of the Players'; Boswell, 'Life of Johnson'; Thomas, in 'Notes and Queries' (1858).

SAVAGE, Richard Henry, American soldier and novelist: b. Utica, N. Y., 12 June 1846; d. New York, 11 Oct. 1903. He was graduated from West Point in 1868 as brevet second lieutenant and in 1871 served as vice-consul of the United States at Rome and Marseilles. In 1872 he was military secretary, with the rank of major, in the Egyptian army and in the latter part of 1872 and during 1873 was United States commissioner to Texas, to settle the Mexican-Texas border dispute. During the Spanish-American War he served as senior major of the United States volunteer engineers. He was a voluminous writer and published among other books 'My Official Wife,' which has been translated into 17 languages; 'For Love and Life'; 'In the Shadow of the Pyramids'; 'Brought to Bay'; 'The Midnight Passenger' (1900).

SAVAGE ISLAND, or **NIUE,** an island of the south Pacific, 40 miles in circumference, and lying between the Samoa and Tonga groups. It is very fertile. Chief products — copra, coffee and fruit. Trade is almost exclusively with New Zealand, to which it was annexed in 1901. The inhabitants are a mixed race of Samoans and Melanesians. They are a quiet people and have become Christians. They speak a Samoan dialect.

SAVAGE STATION, Battle of. While General Sumner was engaging General Magruder at Peach Orchard or Allen's Farm on the morning of 29 June 1862, General Franklin was informed that «Stonewall» Jackson, after repairing the bridges, was crossing the Chickahominy in force and advancing toward Savage Station. Franklin immediately withdrew Smith's division from an isolated and exposed position on Sumner's right and notified Sumner, who at 12 o'clock fell back two and one-half miles to Savage Station and united with Franklin, who had Smith's division only, Slocum's having been sent by McClellan across White Oak Swamp. McClellan had ordered Heintzelman, with his corps, to hold the Williamsburg road until dark, at a point where were several field-works and a skirt of timber between these and the railroad; but through a misunderstanding of his orders, and being convinced, he says, that the whole open space near Savage's was crowded with troops, more than he supposed could be brought into action judiciously, in the afternoon he marched his entire corps, except two batteries, to the rear across White Oak Swamp, without orders from any one, and without a word to Sumner, who, by seniority, was in command, McClellan not being on the field. On reaching Savage Station, Sumner and Franklin drew up in line of battle in a large open field to the left of the railroad, the left, held by Sumner, resting on the edge of the woods, Richardson's division forming his right, Sedgwick's his left. Smith's division on the right extended down to the railroad, with Hancock's brigade reaching into the woods to the right and front to hold the railroad. Davidson's brigade was in reserve, and Osborn's battery was on the line. It was after these dispositions had been made that Heintzelman withdrew and imperiled the left of Sumner's line. Magruder had slowly and cautiously followed Sumner from the Peach Orchard and it was near 5 o'clock when McLaws' division, moving along the Williamsburg road and through the timber that Heintzelman was supposed to be holding, began an attack upon Sumner's left, and was held in check by the vigorous fire of Sumner's artillery. McLaws pressed his attack with great impetuosity, and a hotly contested fight took place on the Williamsburg road. Six regiments of Sedgwick's division, followed by one of Richardson's, were hastened to the threatened point; Brook's Vermont brigade was thrown into the woods that Heintzelman had abandoned, six batteries opened fire,

and at dark, after partial success on either side, the battle ceased, with Sumner's line intact, and the Confederates repulsed. A novel feature of the engagement was the use by the Confederates of a 32-pounder gun, mounted on a platform-car, plated with iron, which was pushed down the railroad, and sent its shells into Sumner's line. Soon after the cessation of the fight, and the destruction of a large amount of supplies, Sumner continued the retreat across White Oak Swamp, abandoning to the Confederates 2,500 sick in the hospitals. McLaws reports a loss of 345 killed and wounded; the total Confederate loss was about 400 killed, wounded and missing. The Union loss is not accurately known.

SAVAII, island. See SAMOAN ISLANDS.

SAVANILLA, one of the names of the tarpon (q.v.).

SAVANNA, city, Illinois, in Carroll County; altitude 592 feet; on the Mississippi River; 138 miles northwest of Chicago; on the Milwaukee, and Burlington railroads. It has large railroad shops and yards, and is a shipping point for the livestock and truck crops of a fertile farm area. Mississippi Palisades State Park is located there. It was settled in 1829. Pop. (1940) 4,792; (1950) 5,058.

SAVANNA-LA-MAR, sà-văn'à-là-mär', seaport, Jamaica Island, British West Indies, seat of Westmoreland Parish, 90 miles west-northwest of Kingston. It is an important trading and shipping center for a district producing sugar, coffee, cacao, ginger, pimento, dyewood, and rum. It is frequently damaged by hurricanes. Pop. (1943 est.) 4,046.

SAVANNAH, city, Georgia, county seat of Chatham County, on the Savannah River, 16 miles from the mouth. It is served by the Atlantic Coast Line; Central of Georgia; Seaboard Air Line; Southern; and Savannah and Atlanta railroads, thus being one of the foremost railway centers of the South.

The city is built on a walled bluff overlooking the river; it is the birthplace of the colony of Georgia and is the second largest city in the state but easily first in historic interest. Its homes recall Georgian England and its gardens and grilled gateways and fences are reminders of its great past. Several improved highways enter the city and it has steamship communication with the principal cities of the Atlantic seaboard, with Central and South America and other ports. Its proximity to the ocean tempers the summer heat with cool breezes while its wealth of flowers and tropical plants gives it an atmosphere unique among American cities.

Commerce.—It is one of the great commercial cities of the South and is the greatest cotton port on the Atlantic coast of the United States. It is the state port of Georgia. It has a water frontage of approximately ten miles. It is one of the great world markets for the shipment of naval stores. The largest sea-going vessels load at the city wharves and the river is navigable as far as Augusta. In addition to cotton and naval stores it ships large quantities of lumber and tobacco.

Manufactures.—The number of industries and their products has largely increased in recent years. The industries include fertilizer plants, cottonseed oil mills, iron foundries, saw mills, planing mills, rice and flour mills, cotton mills, furniture, sash, doors and blind, broom and varnish factories, printing offices, book binderies, a lithographing establishment, sugar refinery and barrel manufactures. There are manufactures of cigars, chemicals, drugs, feeds, ice, novelties, paper and paper bags, plumbers' supplies, vinegar, and tobacco products factories.

Places of Interest, Public Buildings, Etc.—In and near Savannah are many places of interest. These include the Fort Pulaski National Monument; Wormsloe Gardens, a historic old plantation; Barbee's Diamond Back Terrapin Farm, located at Isle of Hope; Bonaventure Cemetery; Savannah Beach, on Tybee Island; the Tybee Lighthouse; the city hall; the United States custom house; St. John's Episcopal Church; the Independent Presbyterian Church; Armstrong Junior College; Hodgson Hall, which houses the Georgia Historical Society; the public library; the Old Harbor Light; the Colonial Park Cemetery; St. John the Baptist Cathedral; the city market; and many old homes of distinctive architecture or of historic interest including the Wayne-Gordon Home, the Sorrel-Weed House, the Green-Meldrim House, Henry Jackson House, Factors' Row, the Flint House, the Woodbridge House, the Dennis House, the Owens-Thomas House, and many large buildings of modern architecture.

Churches and Schools.—Prominent among the church buildings are Wesley Monumental Methodist Church, Trinity Methodist Church, First Baptist Church, St. John's Church, Hebrew Synagogue Mickve Israel. There are over 40 churches in the city, several of which are for the colored. The city also has the Telfair Academy of Arts and Sciences, one of the finest art galleries in the South, opened in 1885. Its art classes and loan exhibitions are a great asset to the cultural life of the city; the Herty Foundation Laboratory, established in 1932, now conducted by the foundation under the auspices of the state was the first to demonstrate the possibility of making paper pulp from Georgia pine.

Parks and Monuments.—The streets are wide and beautifully shaded and intersected with parks or squares at regular intervals. In Johnson, Monterey and Madison squares are monuments to Nathanael Greene, Count Pulaski, and Sergeant William Jasper, heroes of the Revolution. In Forsyth place stands a monument to the Confederate dead. There is also a monument to Tomichichi, the Indian chief.

Government.—The city is governed by a mayor and city council.

Resort Facilities.—Savannah is widely known as an all-the-year-round resort. Its hotels are among the most attractive in the United States, and, in the winter especially, are usually filled with guests. Savannah Beach, 18 miles away, is an attractive bathing resort and is reached by an excellent improved highway. There are numerous golf courses and other sports attractions.

History.—Savannah was founded by Gen. James Oglethorpe in 1733 and was chartered in 1789. In 1778 the British captured the city. In October of the following year it was besieged

by the American and French forces, and in a battle fought on the 9th of that month the combined armies were defeated. In this assault Count Pulaski was mortally wounded. The town remained in the possession of the British until the close of the Revolutionary War. During the Civil War the city was a prominent depot of supplies for the Confederate armies and was the objective point of General Sherman in his march to the sea. After a brief defense it was evacuated by the Confederates and the Union army took possession Dec. 21, 1864.

Population.—In 1850 the population was 15,312; in 1900, 54,244. The corporate limits of the city have since been extended several times in recent years, that is in 1924, 1925 and in 1928. The population in 1910 was 65,064. In 1920 it was 83,252; in 1930, 85,024; in 1940, 95,996; and in 1950, 119,638.

THOMAS PURSE.

SAVANNAH, city, Missouri, Andrew County seat; altitude 1,115 feet; 12 miles north of St. Joseph; on the Burlington and the Chicago Great Western railroads. The surrounding area produces corn, oats, and wheat, and walnut timber; the city is a shipping point for farm produce, poultry, and livestock. In the Civil War it was overrun by both Federals and Confederates. The settlement was platted in 1841. Pop. (1940) 2,108; (1950) 2,332.

SAVANNAH, a river formed by the junction of the Tugaloo and Seneca rivers, and which, from its source, forms the boundary between Georgia and South Carolina. The length of the channel from its source to its mouth is 314 miles, but from the source to the mouth in direct line is only 250 miles. The area of the drainage basin is about 8,500 square miles. The current in the upper part of its course is rapid; considerable quantities of silt are brought down each year, and bars form in the broad portions of the stream where the current moves slowly. The tidal wave ascends to a point about 25 miles above Savannah. At Savannah the rise and fall of the tide is six and one-half feet. The river is navigable for small vessels to Augusta, 212 miles, and for large vessels as far as Savannah. In Aiken and Barnwell counties, on the river, is the United States Atomic Energy Commission's Savannah River Plant (begun in 1951).

SAVANNAH (Ga.), **Operations Against,** in the American Revolution. Since operations in the North had been barren of results, the British determined to renew the attack on the South, beginning the campaign at Savannah. Late in November 1778 Col. Archibald Campbell sailed from New York, landing three weeks later near the mouth of the Savannah River, and quickly dislodging a small force of Americans who attempted to dispute the British advance. Gen. Robert Howe (q.v.) with 800 American troops encamped between the landing place and the city, but a Negro apprised Campbell of a by-path by which he could gain the rear of the American camp, and in the battle that followed the Americans found themselves between a cross-fire. Hence they retreated, leaving 100 of their number dead and wounded and about 400 in British possession. The Americans fled up the Savannah River and crossed into South Carolina, while the British occupied the city and remained in possession until the close of the war. Meanwhile, in November 1778, Comte d'Estaing had sailed with a French fleet to attack the British West Indies, after which, at the solicitation of the Americans, he went to Savannah, arriving Sept. 1, 1779 with 22 ships of the line and other smaller vessels. Gen. Benjamin Lincoln (q.v.) with 1,000 troops, reinforced by troops under Count Pulaski (q.v.), and Colonel McIntosh and a detachment of 3,000 French troops, lay siege to the city by land while d'Estaing carried on the naval operations. The city was defended by Gen. Augustine Prevost with about 2,500 troops. On Sept. 23, 1779 siege works were begun and on October 1 the various batteries opened a bombardment, which continued for several days without effect. Despairing of capturing the city by this method the allied forces decided to storm the British works. Accordingly, on October 9, 4,500 French and Americans advanced in three columns, but were met with such a galling fire from the British batteries that, though successful in planting standards on the redoubts, they were repulsed with considerable loss. With 200 troops Pulaski endeavored to strike the garrison in flank, but he was killed and his troops dispersed. Unable longer to withstand the British fire, the attacking forces retired, the French having suffered a loss of 640 killed and wounded and the Americans 450. The British loss was comparatively small. On October 18 the siege was abandoned, the Americans recrossing the Savannah at Zubly's Ferry, and taking position in South Carolina, while the French embarked on their ships and sailed away.

SAVANNAH TO GOLDSBORO, Sherman's Campaign from (including the battles of Averasboro and Bentonville). Sherman's March to the Sea culminated in the capture of Savannah Dec. 21, 1864. It was a brilliant campaign, but of minor importance compared with that upon which he immediately prepared to enter. He says: "Were I to express my measure of the relative importance of the march to the sea, and of that from Savannah northward, I would place the former at one, and the latter at 10, or the maximum." Before the capture of Savannah, Sherman had received from General Grant a letter, dated December 6, in which he had given his idea of Sherman's further movement, which was to establish a base on the sea coast, fortify it, leave all artillery and cavalry, and enough infantry to protect them and threaten the interior, so that the militia of the South would have to be kept at home, and with the remainder of his command take transports for James River, join Grant before Richmond and participate in the destruction of Lee's army and the overthrow of the Confederacy. Sherman replied: "I had expected, after reaching Savannah, instantly to march to Columbia, S. C., thence to Raleigh, and then to report to you." After the surrender of Savannah, Grant (December 27) accepted Sherman's plan and instructed him to start on his expedition northward without further delay, break up the railroads in South Carolina

and North Carolina and join the armies operating against Richmond as soon as he could and by the route he deemed best. Sherman hastened his preparations; General Grover's division of the 19th corps was detached from the Army of the Shenandoah and ordered to Savannah as a garrison, and General Foster, commanding the Department of the South, was instructed to follow Sherman's inland movements by seizing in succession Charleston and other points on the coast, which might be abandoned. Ammunition, rations and clothing were accumulated, and 14 Jan. 1865 the 17th corps, General Blair, took transports at Savannah for Hilton, S. C., and moved to Beaufort, thence to Pocotaligo, on the Charleston and Savannah Railroad, thus threatening Charleston. Later the 15th corps, except Corse's division, joined the 17th. The left wing, 14th and 20th corps, under General Slocum, with Corse's division and Kilpatrick's cavalry, moved up the Savannah River, 40 miles, to Sister's Ferry, thus threatening Augusta. When Slocum arrived at Sister's Ferry the river had overflowed its banks and submerged the adjacent lowland, and there was a delay of some days before the waters had fallen sufficiently for a crossing. On 1 February, when the general movement began, the army was composed of two wings: the right wing, under Gen. O. O. Howard, consisted of the 15th corps, Gen. John A. Logan, and the 17th corps, Gen. F. P. Blair; the left wing, under Gen. H. W. Slocum, consisted of the 14th corps, Gen. J. C. Davis, and the 20th corps, Gen. A. S. Williams. The cavalry division, under General Kilpatrick, moved with the left wing, as also, at first, Corse's division of Logan's corps. The strength of the army 1 February was 53,923 infantry, 4,438 cavalry and 1,718 artillery, in all 60,079 men with 68 guns. There were about 600 ambulances, 2,500 wagons and provisions for 20 days, mostly of bread, sugar, coffee and salt. Beef cattle were driven and it was expected that a good supply of cattle, hogs and poultry would be gathered on the march. The disposition of the forces from Sister's Ferry on the left to Pocotaligo on the right menaced Augusta, Columbia and Charleston and left the Confederates in doubt as to the true point upon which Sherman was to move. The Confederates, under General Hardee, whose headquarters were at Charleston, and who had about 16,000 men, occupied the line of the Salkehatchie River, while Wheeler's cavalry operated on the heads and flanks of the advancing column. On 1 February the movement began. Howard's right wing marched from Pocotaligo for the Beaufort and Rivers' bridges of the Salkehatchie for the purpose of pushing on to the Edisto River, thus flanking Charleston. There was a sharp engagement (3 February) at Rivers' bridge, in which two divisions of Blair's corps waded breast deep through the swamp and carried the bridge with a loss of 88 killed and wounded, the Confederate loss being 52 killed and wounded. The Confederates, driven from the line of the Salkehatchie, retreated to Branchville, behind the Edisto, burning the bridges behind them. The left wing, under Slocum, marched through Barnwell, and on 10 February both wings were in the vicinity of Branchville on the Charleston and Augusta Railroad. Kilpatrick on the left went as far as Aiken and threatened Augusta. From Branchville the railroads in every direction were thoroughly destroyed, and the army started for Columbia, each of the four corps taking a separate road. Howard went by the Orangeburg road, and on the 16th his head of column approached Columbia, which was occupied by Gen. C. L. Stevenson's division of infantry, and Butler's and Wheeler's divisions of cavalry, in all about 5,000 men. Stevenson fell back to Winnsboro, leaving Wade Hampton, commanding the cavalry, to follow. On the 17th the 15th corps marched through the city and encamped beyond it on the Camden road. During the night the greater part of the city was accidentally burned. Slocum, advancing by Barnwell and Lexington, destroyed the Charleston and Augusta Railroad for several miles, and, after menacing Augusta, received orders to cross the Saluda River, at Mount Zion's Church, above Columbia. During the night a bridge was constructed and next day Slocum and Kilpatrick crossed, passed over Broad River and on the 21st arrived at Winnsboro, destroying on the way several miles of railroad north and south of Alston. Sherman, with the right wing, marched from Columbia, on the 20th, on the direct road to Winnsboro, and threatened Charlotte, N. C. He destroyed the railroad between Columbia and Winnsboro, and joined Slocum at the latter place. On the day that Sherman occupied Columbia, General Hardee evacuated Charleston, after destroying the public buildings, two iron-clad steamers, cotton and other property, and with about 14,000 men moved to Cheraw, on the Peedee River, and thence by a long march to Fayetteville, N. C. Next day Charleston was occupied by the Union troops of General Foster, who found 450 abandoned guns. The city had been fired, churches and private residences burned and everything presented a scene of desolation. Sherman, in his march, had made a clean swath of 40 miles, burning bridges, wrecking railroads and devouring nearly everything. Each family was left a reasonable amount of food, but all horses, mules and wagons were taken. From Winnsboro, Slocum destroyed the railroad as far north as Chester, threatened Charlotte, and then, forcing to the left the Confederates who were concentrating to dispute the march on Charlotte, the entire army turned eastward for Fayetteville, Slocum crossing the Catawba River at Rocky Mount and joining Howard, who had marched by roads farther south, at Cheraw (3 March), where were found 24 guns, 3,600 barrels of gunpowder and large supplies of stores, public and private, sent from Charleston for safe-keeping. Hardee made no opposition to the occupation of the place, and retreated to Fayetteville, leaving Wade Hampton's cavalry to cover his rear and burn the bridges behind them. On the 6th Sherman resumed his march on Fayetteville, by four different roads, and reached it on the 10th, Hardee again retreating without a show of defense, leaving Wade Hampton to skirmish with Sherman's advance and burn the bridge over the Cape Fear River. Kilpatrick, covering the movement on Sherman's left and rear, was surprised on the night of the 9th by Hampton's cavalry and pretty roughly handled, being driven from his camps and losing all his guns, which, however, he regained. He lost 183 men,

of whom 103 were captured. The march through South Carolina had been greatly delayed by almost incessant rains and the swampy nature of the country. Nearly all the way the army was compelled to corduroy the roads before the trains could be moved, in some instances the first corduroying was out of sight before the trains had all passed, and another road was laid over it. All this was done cheerfully by the men, working in icy water up to their knees. Before reaching Fayetteville it was heard that General Terry had taken Wilmington, and the day after the arrival of the army a Union steamer came up Cape Fear River, confirming the news and bringing mails and dispatches. Having thoroughly destroyed the arsenal buildings, foundries and machine-shops at Fayetteville, the army crossed Cape Fear River on the 13th and 14th for Goldsboro, the objective point of the campaign, where it was to unite with Generals Schofield and Terry, who were marching on that place from Newbern and Wilmington. It was now known that Gen. J. E. Johnston had been ordered to delay Sherman's advance, and Sherman estimated that he had 37,000 men for the purpose. Apprehending that Johnston would seek an opportunity to strike him on the last stage of the march, Sherman ordered Slocum on the left to send his trains under a strong guard by an interior road on his right, and to keep at least four divisions with their artillery on the left well in hand, to meet an attack. Under this order Geary's and Baird's divisions were detailed to guard the trains. Slocum, preceded by Kilpatrick's cavalry, advanced on the direct road to Averasboro, to make a feint on Raleigh, and Kilpatrick was then to strike the railroad near Smithfield. Sherman says he "proposed to drive Hardee well beyond Averasboro and then turn to the right by Bentonville for Goldsboro." On the 15th Hardee was retiring from before Slocum, having for his rear-guard a brigade composed of artillery troops that had garrisoned Charleston, under command of Col. Alfred Rhett. During the evening Kilpatrick, in skirmishing with this rear-guard, near Taylor's Hole Creek, took some prisoners, among whom was Colonel Rhett.

Battle of Averasboro.— On the morning of the 16th opposition to the march was quite stubborn, and Kilpatrick, forcing back the Confederate rear-guard, came upon a line of intrenchments, on a narrow neck of swampy land, between Cape Fear and South rivers, and covering the road to Bentonville, along which Sherman intended that Slocum's wing should march to Goldsboro. Kilpatrick's cavalry was moved to the right and Jackson's and Ward's divisions of Williams' 20th corps were deployed in front of the Confederate line, and the two divisions of the 14th corps ordered up on Williams' left. Case's brigade was sent by Williams to the left to gain the flank and rear of the Confederate line, and succeeded in striking it in flank and sweeping it from position, capturing McBeth's Charleston battery of three guns and 217 of Rhett's artillery acting as infantry. Jackson's and Ward's divisions advanced and came upon the Confederates in another line of works about 400 yards in rear of the first. Kilpatrick was sent to the right to seize the Bentonville road, but his leading brigade was driven back by a furious attack of McLaws' division, upon which the Union infantry advanced directly against Hardee, who also was advancing, and drove him inside his works, and Slocum went into bivouac in his immediate front. During the night, which was stormy and very dark, Hardee retreated, leaving 108 dead and 68 wounded on the field. His entire loss, as estimated, was about 650, of whom 175 were captured. Slocum's loss was 77 killed and 477 wounded. Next morning Ward's division pursued Hardee a short distance beyond Averasboro and ascertained that he had retreated toward Smithfield.

Sherman was now under the delusion that no serious opposition would be made to his march on Goldsboro. "All signs," he says, "induced me to believe that the enemy would make no further opposition to our progress, and would not attempt to strike us in flank, while in motion." Under this impression his commanders were instructed to march their troops in the easiest manner and by the nearest roads to Goldsboro. The left wing marched from Averasboro on the direct road and on the night of the 18th, after driving back Hampton's cavalry to a position selected by Hampton for a battle, the 14th corps in advance, encamped 25 miles from Goldsboro and five from Bentonville, at a point where the road from Clinton to Smithfield crossed the one to Goldsboro. Two divisions of the 20th corps were camped 10 or 12 miles in rear, while Geary's and Baird's divisions were on other roads, with the trains still farther to the south. Howard's two corps were to the south and east, their advance at Lee's Store, more than a day's march distant. Sherman had been with Slocum and the left wing since the 14th and very early on the morning of the 19th started to join Howard, several miles to the east and south, to concentrate his forces and unite with Slocum at Goldsboro, where he expected to meet Schofield and Terry. He had no suspicion that General Johnston with a strong force was then in Slocum's immediate front, and supposed that the only opposition to be met would be from cavalry. When about to leave Slocum he expressed the opinion that Hardee had fallen back to Raleigh and that Slocum could reach Neuse River the next day, in which opinion Slocum concurred. But General Carlin, commanding a division of the 14th corps, and who was nearest the enemy, had observed matters that indicated a large force in front prepared for battle, and sought to impress his own convictions upon Sherman, who made light of them, said nothing but cavalry was in front and rode away to join Howard.

On 23 February Gen. J. E. Johnston had been assigned to the command of all the forces that could be collected to make head against Sherman. At this time Hardee was moving toward Fayetteville, N. C.; Beauregard was directing the march of C. L. Stevenson from Winnsboro to Charlotte; Cheatham, with his division of Hood's army, had come from Augusta, Ga., and was moving toward Charlotte, but on the west side of the Congaree and Broad rivers, and A. P. Stewart, with about 1,000 men of Hood's army, was marching for Charlotte. Johnston's first task was to concentrate these troops, which was done at Smithfield, N. C., where he was joined by Hoke's division from Lee's army at Richmond, which had unsuccess-

fully engaged General Cox, near Goldsboro (see KINSTON, BATTLE OF), and also by S. D. Lee, with about 3,000 men of Hood's army. In all Johnston had about 20,000 men. He had as subordinate commanders Generals Bragg, Hardee, A. P. Stewart, S. D. Lee, Wade Hampton and others of high rank, who had long been the pride and ornaments of the Confederate armies.

Battle of Bentonville.— On the 17th General Johnston had become satisfied that Sherman was not marching on Raleigh. He heard on the morning of the 18th that Sherman was marching on Goldsboro, and was informed by Wade Hampton that the 14th corps was in his immediate front, that the 20th corps was several miles in rear on the same road, while Howard's two corps were on roads some miles to the south, and he determined to crush the 14th corps before the 20th could come to its support, and then fall upon the 20th. He ordered Hampton to hold Slocum's head of column in check until he could march from Smithfield, 16 miles distant, and join him to give battle on ground that Hampton had selected, and to which he was forced back that evening, which was at a point about three miles south of Bentonville. In order to attack the head of Slocum's column early next morning, Johnston immediately marched his army from Smithfield, intending to bivouac that night between Bentonville and the road on which Slocum was moving. But the distance was greater than expected, the roads bad, and but a small part of the column reached Bentonville that night, the main column bivouacking some distance in the rear. As soon as Hardee's troops reached Bentonville next morning they were marched by the left flank, Hoke's division leading, to the ground selected by Hampton, on the eastern edge of an old plantation, extending one and one-half miles to the west, lying principally on the north side of the road, and surrounded east, south and north, by dense thickets of black-jack. As there was but one narrow road through the thicket, the deployment of the troops consumed a weary time. Hoke's division was formed with its centre on the road, its line at right angles to it, on the eastern edge of the plantation, and its left extending some 400 yards into the thicket to the south. Two batteries, the only artillery, were on his right, commanding the ground in front to the extent of the range of the guns. The troops belonging to the Army of Tennessee were formed on the right of the artillery, their right strongly thrown forward, conforming to the edge of the open ground. Meanwhile, and before these dispositions had been completed, the battle had opened. Very early in the morning Hampton had thrown forward his cavalry, and when Carlin's division of the 14th corps began its march at 6 o'clock it became almost immediately engaged with the Confederate cavalry, which offered such a stubborn resistance that Carlin deployed his entire division and brought up his artillery, and one brigade was sent to the left to develop the Confederate line, and as the resistance increased Morgan's division was moved to Carlin's right as a support, and the entire line was ordered to go forward, and was soon severely engaged, convincing Slocum that he had something more than cavalry in his front, of which fact he was soon further convinced by a deserter from the Confederates, who informed him that Johnston was in his immediate front, and that the talk in the Confederate camp was that Slocum was to be crushed.

Slocum prepared for defense by throwing up works, ordered Williams, commanding the 20th corps, to throw his train to the right and hasten up, and sent a messenger to Sherman with the information that Johnston's army was in his front. Carlin's division in advancing struck Hoke's division and after some severe fighting was repulsed, upon which Johnston ordered Hardee to charge with the right wing, Stewart's Army of Tennessee troops and Taliaferro's division, and General Bragg to join in the movement with his brigades successively, from right to left, each making the necessary change of front to the left in advancing. Hardee led his men forward and drove Carlin back just as the advance of the 20th corps came up, one brigade of which was sent to Carlin's support, and was driven back with him, and another put in the gap between Carlin and Morgan just as the Confederates reached the line, the remainder of the corps forming on Carlin's left. The Confederates had become somewhat broken up in advancing through the woods, and when they received a telling fire from behind the slight entrenchments that had hurriedly been thrown up they fell back. On the right Morgan's division of the 14th corps, with its supports, held its ground against Bragg's persistent attacks. The Confederate assaults were repeated several times until a late hour, each assault finding the Union line better prepared to receive it. Johnston had given the 14th corps a heavy blow, but had failed to crush it, and determined not to renew the attack, but only to hold the ground until his wounded could be removed. The battle of the 19th was fought by about 16,000 men of the 14th and 20th corps on one side and about the same number of Confederates on the other.

When Capt. Joseph B. Foraker delivered to Sherman the message from Slocum that he had run up against Johnston's whole army, Sherman was incredulous, but he sent word to Slocum to hold on, ordered the 15th corps, which was well to the rear, to turn at once toward Bentonville, and the 17th corps to move in the same direction. Hazen's division of the 15th corps reported to Slocum during the night and was placed on the right. Early in the morning of the 20th Geary and Baird, each with two brigades, arrived on the field. Baird was placed in front of the works and moved out beyond the advanced position held on the preceding day. The day was spent in strengthening the position and developing the line of the enemy, which brought on sharp skirmishing. The right wing under Howard came up late in the afternoon of the 20th and on the morning of the 21st. It had marched 20 miles over bad roads, skirmishing a great part of the way with the Confederate cavalry. There was heavy skirmishing during the day, but no general attack, and during the night Johnston retreated, crossing Mill Creek by the bridge at Bentonville and bivouacking on the night of the 22d near Smithfield. The Union loss in the battle was 191 killed, 1,168 wounded and 287 missing,

an aggregate of 1,643. The Confederate loss was 239 killed, 1,694 wounded and 673 missing, an aggregate of 2,606.

On the 22d Sherman resumed his march on Goldsboro and on the 23d and 24th his entire army was assembled around the place and junction made with Schofield's and Terry's forces, which had occupied it two days before. (See GOLDSBORO, KINSTON, etc.) "Thus," writes Sherman, "was concluded one of the longest and most important marches ever made by an organized army in a civilized country. . . . The country generally was in a state of nature, with innumerable swamps, with simply mud roads, nearly every mile of which had to be corduroyed. In our route we had captured Columbia, Cheraw and Fayetteville, important cities and depots of supplies, had compelled the evacuation of Charleston City and Harbor, had utterly broken up all the railroads of South Carolina and had consumed a vast amount of food and forage, essential to the enemy for the support of his own armies. We had in mid-winter accomplished the whole journey of 425 miles in 50 days, . . . and had reached Goldsboro with the army in superb order and the trains almost as fresh as when we had started from Atlanta." Consult *Official Records,* vol. XLVII; Van Horne, *History of the Army of the Cumberland,* vol. II; Sherman, *Memoirs,* vol. II; Johnston, *Narrative;* The Century Company's *Battles and Leaders of the Civil War,* vol. IV.

SAVARY, sä-vä-rē, **Anne-Jean-Marie-René,** DUKE OF ROVIGO, French general: b. Marcq, department of Ardennes, April 26, 1774; d. Paris, June 2, 1833. In 1789 he entered an infantry regiment. He served under Custine, Moreau and Desaix, and accompanied the last named on the expedition to Egypt. After the battle of Marengo he was appointed adjutant to Bonaparte, and soon rose very high in his confidence. After rising to the rank of lieutenant general he was rewarded, after the victory of Friedland, with the title of Duke of Rovigo. In 1808 the emperor sent him to Madrid, where he negotiated the arrangement by which the Spanish king and his son were kidnapped. In 1810 he succeeded Fouché as minister of police. On Bonaparte's return from Elba he gave in his adhesion to him, and was appointed inspector general of gendarmes. He was carried to Malta in 1815, but escaped after being a prisoner for seven months. While there he began his *Memoirs.* Later he stood trial at Paris as one who had contributed to Napoleon's return, but was acquitted. In 1831–33 he was military commander of Algiers.

SAVASTANA. See GRASSES IN THE UNITED STATES.

SAVERNE, sä-vĕrn′, (Ger. ZABERN), France, a town on the Zorn River, capital of the *arrondissement* of Bas-Rhin, in the department of the same name (formerly Lower Alsace), situated at the entrance to the Col de Saverne, a pass through the northern approaches to the Vosges, affording passage for the Rhine-Marne Canal, and the railway connecting Strasbourg with Metz and Nancy. It has sandstone quarries, and its manufactures include metal goods, optical glass, and a famous kirsch. Figuring in Roman times as a communications center called Tres Taburnae, and later for centuries as a possession of the bishops of Strasbourg, it has impressive ecclesiastical buildings, parts of which date back to the 12th century, and a Gallo-Roman museum. The ominous Zabern incident, a dispute between local recruits and the German military authorities, occurred here in November 1913, less than a year before the outbreak of World War I. Population (1936) 9,006.

SAVERY, Thomas, English engineer: b. Shilstone, near Modbury, Devonshire, about 1650; d. London, May 1715. He became a military engineer and rose to be captain in 1702. He is known for his inventions, most important of which was a machine for raising water from mines, which was the first practical application of steam power to a mechanical purpose. A patent granted him in 1698 extended until 1733.

SAVIDGE, Eugene Coleman, American physician and author: b. Maryland, Oct. 21, 1863; d. Oct. 10, 1924. He was graduated from the University of France in 1888; from that of New York in 1889. He was editor of the *Expressman* and was attending gynecologist at Saint Mark's Hospital, New York. He wrote *Wallingford* (1882); *Life and Times of Brewster* (1891); *The American in Paris* (1895); *Selective Involution; Philosophy of Radio-Activity* (1914); *The Problem of Cancer; Unclassified Dreams* (1915).

SAVIGNY, sä-vēn-yē, **Friedrich Karl von,** German jurist: b. Frankfort-on-the-Main, Feb. 21, 1779; d. Berlin, Oct. 25, 1861. He studied chiefly at Marburg, became a lecturer there in 1800, and in 1803 professor of jurisprudence. In 1808 he was made professor of law in the University of Landshut, in Bavaria, and in 1810 obtained the chair of jurisprudence in the newly established University of Berlin, where he continued to lecture with uninterrupted success for 32 years. He was elected a member of the Prussian Academy of Science in 1811, was appointed a councilor of state in 1817 and in 1842 minister of justice for the revision of the law. He retired in 1848. His principal works are *Geschichte des römischen Rechts im Mittelalter* (1815–31); *System des heutigen römischen Rechts* (1840–48), to which *Das Obligationenrecht* (1851–53) forms an appendix; *Vermischte Schriften* (1850), a collection of essays which had appeared in legal periodicals. He brilliantly applied the historical method to the exposition of the Roman law. Consult the biographies by Bethmann-Hollweg (1867) and Enneceerus (1879).

SAVILE, săv′ĭl, or **SAVILLE, George,** MARQUIS OF HALIFAX, English statesman and writer: b. Thornhill, Yorkshire, Nov. 11, 1633; d. London, April 5, 1695. On the death of Cromwell he distinguished himself by his exertions in behalf of Charles II. In 1669 he was appointed a commissioner of trade, in 1672 became a member of the Privy Council, and in 1682 was created Marquis of Halifax and lord privy seal. Under James II he was made president of the council, but was dismissed from office because he opposed the repeal of the Test and Habeas Corpus acts. From this time Lord Halifax continued in opposition, and contributed to the elevation of William III to the throne. He was the author of *Advice to a Daughter* (1868), and of a variety of political tracts, the principal of which are *Maxims of State; The*

Character of a Trimmer; Character of King Charles II; Anatomy of an Equivalent; Letter to a Dissenter.

SAVILE, Sir **Henry,** English scholar: b. Bradley, near Halifax, Yorkshire, Nov. 30, 1549; d. Eton, Feb. 19, 1622. He was educated at Oxford, became tutor in Greek to Queen Elizabeth, and in 1585 was made warden of Merton College and provost of Eton in 1596. He was knighted in 1604. In 1619 he founded two professorships in geometry and astronomy at Oxford, besides conferring several other valuable benefactions, both in property and books. Among his works the principal are his *Commentaries on Roman Warfare* (1591); *Rerum Anglicarum post Bedam Scriptores* (1596); *Praelectiones tresdecim in principium elementorum Euclidis* (1621); and his edition of the writings of St. Chrysostom (1610–1613), in eight folio volumes.

SAVILLE, Marshall Howard, American archaeologist: b. Rockport, Mass., June 24, 1867; d. New York, N. Y., May 7, 1935. He studied anthropology as a special student at Harvard University in 1889–1894, and afterward engaged in field work under Professor F. W. Putnam. He conducted investigations of the remains of the Ohio mound builders, making some notable discoveries. He also made important explorations in Yucatan in 1890; in Honduras in 1891–1892, 1915; in Mexico in 1899, 1902–1904; in Ecuador in 1906–1910, 1913; in Colombia in 1914; and in Central America in 1917. He was on the staff of the American Museum of Natural History, 1894–1905; professor of American archaeology, Columbia University, after 1903; and on the staff of the Museum of the American Indian after 1918.

SAVIN, or SABIN. See Juniper.

SAVINGS AND LOAN ASSOCIATIONS. These organizations are the only financial institutions in the United States devoted almost exclusively to the promotion of thrift and home ownership. Their motto is: "The American home is the safeguard of American liberties."

In addition to the term, "savings and loan associations," these organizations are known as building and loan associations, building associations, homestead associations, and cooperative banks. The savings and loan name is required by law to be used by all federal savings and loan associations, representing nearly one half the assets of the business, and is required or permitted by law, and used by such associations incorporated under state law in most of the states. The name "cooperative bank" is used by the state organizations in Massachusetts and Rhode Island. It is estimated that associations having about 70 per cent of the assets operate under the name of "savings and loan association," about 10 per cent under the name "cooperative bank," and most of the remainder under the name "building and loan association." The trend is toward the use of the name "savings and loan association."

The first such association in America, similar to the building societies (q.v.) in England, was organized in 1831 in Frankfort, now a part of Philadelphia, Pa. Many of the early organizations, prior to 1850, were organized as terminating associations for the sole purpose of enabling each member to acquire a home. In many of these cases, a sufficient number of members would join in the beginning so that the monthly payment of $10, or some such sum, would provide enough money to build one member a home each month. In some cases there was a drawing each month, and the most fortunate member received the funds to build his home at once and secured his obligation to pay monthly until all members received the money for a home by a mortgage on his home. This provided 100 per cent of the money for a lot and a home and, in some cases, no interest was charged. These terminating associations rendered a great service for about a generation.

Because of this service, new associations were organized as serial associations. In these organizations, a new group of members were received periodically, quarterly, semiannually or annually, and each series operated substantially as a terminating association, but the organization was continuous. Many of these associations were opened to members who desired to save, some of whom did not desire to build a home; therefore interest was charged to borrowers, and nonborrowers received their savings with their earnings upon maturity of their contract. Those who borrowed and got their homes early, paid interest in addition to their share payments; those who waited, received earnings and therefore completed their payments in a shorter period of weeks or months. The serial associations rendered great service in the promotion of thrift and home ownership from about 1850 to 1890, and many of them were still serving acceptably in 1950.

Permanent associations were organized at an early date in Charleston, S. C., Dayton, Ohio, and elsewhere. These associations accepted new members from day to day and payments were made to them either in regular installments or at the option of the member. They loaned money for the financing of homes and charged interest in the customary manner. The serial associations and the permanent associations made great progress from about 1900 until about 1930.

In 1933, at the bottom of a long depression affecting real estate values and other values, the Congress of the United States authorized the chartering, examination, and supervision by the federal government of federal savings and loan associations. These associations are similar to the mutual savings banks. They accept savings and investment funds and issue share accounts to the savers and investors, who share the net earnings of the fund semiannually as dividends. Such funds are withdrawable at the request of the saver or investor, subject to the right of the association to pay withdrawals, in time of stress, after 30 days, and in an orderly manner, from receipts, as specified in the charter of the association, which is available to all members. Customarily, savers and investors withdraw their funds at their convenience, as in the case of any other savings account. Their funds are employed in the making of monthly amortized home mortgage loans within 50 miles of the office of the association, with a provision authorizing not over 15 per cent of assets to be employed in the making of loans within said area or outside of it, but secured by first lien upon other improved real estate; and they are authorized to invest in government bonds without limit. Most state associations are now organized and operate upon substantially the same basis.

Until recent years, customarily, the borrower signed a note for the amount of money borrowed,

with interest payable weekly or monthly in a specified amount, which note was secured by a mortgage upon the home of the borrower and also by the pledge of a share account in the same amount and maturing upon the maturity of such share account. The loan contract included a subscription to shares of the association in the same amount as the loan and provided for weekly or monthly payments thereon until such account, including payments and earnings, became paid up, at which time, under the contract, the funds were withdrawn from the matured share account and used to liquidate the indebtedness represented by the note. When money was cheap, customarily interest was charged, but when money was dear, in some cases the customer paid a lump sum discount on his loan in the beginning or a monthly premium, in addition to interest. Generally, the monthly payment, representing interest on the loan, premium, if any, and share payment, was approximately the same as the rental value of the home. Such loans customarily paid out in about 12 years.

In the late 19th century many of the permanent plan associations and, more recently, many serial associations and all federal associations began to make definite contract, direct reduction loans, and this system is now almost universally used. Under this plan, the borrower signs a note or bond for the amount borrowed, providing for monthly payments (which are customarily about the same as rent) which are applied, first, to interest at a specified rate upon the unpaid balance of the indebtedness and the balance to principal, until the indebtedness is paid in full, and such note is secured by first mortgage on the home. Upon these loans, the monthly payment is carefully adjusted to the family budget so as to pay the indebtedness in full in from 10 years to about 20 years.

Formerly, homes were financed under very rigid contracts, which frequently embarrassed the

Table 1—NUMBER OF SAVINGS AND LOAN ASSOCIATIONS' ASSETS

State	Number of institutions			Total assets			Increase over 1948
	State	Federal	Total	State	Federal	Total

[1] Data for state-chartered associations in Connecticut are as of September 30, 1949.
[2] Data for state-chartered associations in Maryland are estimated throughout tabular matter.
[3] Data for state-chartered cooperative banks in Massachusetts are as of October 31, 1949.
[4] Data for state-chartered associations in Nebraska, New Hampshire, Tennessee, and Vermont are as of June 30, 1949.
* Estimated.

borrower in periods of extraordinary family expense or in periods of reduced income on account of economic depression or otherwise. In recent years, savings and loan associations, and similar institutions, have made great progress by:

(1) Adjusting the loan payment more carefully to the family budget; (2) providing for even monthly payments until the debt is paid in full without renewal or other expense; (3) permitting prepayment so as to save interest, and to provide a breathing spell, so long as the loan is prepaid; (4) providing an automatic adjustment of interest rate so that the somewhat higher rate carried by a high percentage loan involving some risk is automatically reduced to a lower rate as the loan is paid off and the risk declines; (5) providing for additional advances by the lender to the borrower under the mortgage without expense and at a low rate to provide necessary funds for maintenance, repair and improvements, or other purposes; (6) waiver of a certain number of payments, usually up to six, after the loan has been reduced by regular payments for a specified period, usually three years; (7) provision for payment of taxes and insurance (sometimes including life insurance) upon a monthly basis; and (8) other special provisions for the accommodation of the borrower.

Such loans are customarily made up to 80 per cent or even 90 per cent of the value of the home in order to enable young families to acquire a home with a comparatively nominal cash payment. In spite of a few such high percentage loans, and with monthly amortization of all loans, the association is usually protected by first lien upon real estate which, in the aggregate, is about twice the unpaid balance of all loans.

In 1950, there was much discussion of the postwar home, the "package" home, which is complete, ready to live in, with some rather expensive equipment, such as electric or gas stoves, refrigerators, special furnaces and oil burners, much of which equipment was formerly considered to be chattels and not a part of the real estate. To enable the homeseeker to start off with such a complete home, plans were made to finance a high percentage of the total cost, including such equipment, with a low interest rate, monthly amortized,

Table 2—ESTIMATED AMOUNT OF MORTGAGE LOANS MADE BY SAVINGS AND LOAN ASSOCIATIONS IN THE UNITED STATES, 1925–1949

Year	Amount of loans made	Year	Amount of loans made
1925	$1,760,000,000	1938	$ 797,996,000
1926	1,945,000,000	1939	986,383,000
1927	2,110,000,000	1940	1,199,579,000
1928	2,153,000,000	1941	1,378,684,000
1929	1,850,000,000	1942	1,050,501,000
1930	1,300,000,000	1943	1,183,961,000
1931	900,000,000	1944	1,454,000,000
1932	530,000,000	1945	1,913,000,000
1933	435,000,000	1946	3,584,492,000
1934	462,800,000	1947	3,810,800,000
1935	641,540,000	1948	3,607,000,000
1936	754,997,000	1949	3,636,000,000
1937	896,579,000		

Table 3—CONSOLIDATED STATEMENT OF CONDITION ALL SAVINGS AND LOAN ASSOCIATIONS AND COOPERATIVE BANKS, DECEMBER 31, 1949

Assets	Amount	Percentage of total	Percentage change from Dec. 31, 1948
Cash on hand and in banks	$ 874,750,000	6.0%	+32.9%
Government bonds	1,496,649,000	10.2	+ 2.6
Mortgage loans and real estate contracts	11,750,482,000	80.5	+11.9
Real estate owned [1]	13,110,000	0.1	−45.5
All other assets	470,001,000	3.2	+ 9.8
Total	$14,604,992,000	100.0%	+11.8%

Liabilities	Amount	Percentage of total	Percentage change from Dec. 31, 1948
Savings and investment accounts	$12,558,861,000	86.0%	+13.3%
Borrowed money [2]	490,966,000	3.4	−18.6
All other liabilities	446,424,000	3.0	+ 8.4
General and unallocated reserves [3]	1,108,741,000	7.6	+14.2
Total	$14,604,992,000	100.0%	+11.8%

[1] Excludes office buildings.
[2] Includes advances from FHL banks.
[3] Includes insurance reserve, excludes specific reserves.

flexible type mortgage suited to the family budget and to many of the ups and downs of family life.

The prevailing home mortgage rate in the United States in 1905 was about an average of 6 per cent per annum or less, in 1925 an average of 7 per cent per annum or more, and in 1950 approximately 5 per cent per annum. Many loans were made in 1950 at 4 per cent per annum or less.

The savings and loan business in 1950 consisted of about 6,000 associations, 4,500 operating under state charter and 1,500 under federal charter, with nearly 10,000,000 members owning nearly $15,000,000 of invested capital. They carry the home financing for 3,300,000 American families. All of these home loans are amortized monthly by a payment which pays all interest and some principal each month, leading to debt-free home ownership.

About 3,800 of these associations, representing about 85 per cent of assets, are members of the Federal Home Loan Bank System, which provides them with convenient short-term credit and long-term credit to assure more continuous normal functioning at all times in all areas of the country. About 2,800 of them, representing about 70 per cent of the assets, are members of the Federal Savings and Loan Insurance Corporation for the insurance protection of savers and investors. Federal savings and loan associations are required to have such membership. State associations may have such memberships upon application and qualification.

These associations in recent years have made about 33 per cent of the home loans recorded in the United States. This is to be compared with about 25 per cent of such loans made by commercial banks and trust companies, 5 per cent by mutual savings banks, and 8 per cent by insurance companies. In recent years the associations have had an excess of savings and investment funds over and above their mortgage loan requirements and are carrying an average of about 5 per cent in cash and 15 per cent in government bonds.

It now appears that nearly all of these associations will shortly have their savings accounts and investments insured to $10,000 for each customer by Federal Savings and Loan Insurance Corporation, a permanent government corporation, similar to the situation in the United States where nearly all commercial banks and trust companies have their accounts insured to $10,000 for each customer by Federal Deposit Insurance Corporation, a similar government corporation. These associations are growing at the rate of about 15 per cent per annum in volume of savings and are rapidly gaining recognition as savings institutions throughout the United States and its territories and possessions.

While about 70 per cent of the loans made by these savings institutions are conventional, monthly amortized, home mortgage loans without any government assistance, they are also amongst the principal mortgage lenders, making government guaranteed and insured loans to veterans, and loans insured by Federal Housing Administration to the general public.

Table 1 indicates the number of such associations, their assets, and number of savings members and borrowers. Table 2 indicates estimated amount of mortgage loans made by such associations from 1925 to 1949. Table 3 is a consolidated statement of condition of such associations. These statistics are taken from "Savings and Loan Annals, 1950," published by United States Savings and Loan League, Chicago 1, Illinois, and are based upon official reports and estimates.

HORACE RUSSELL,
Member, Chicago Bar.

SAVINGS BANK. See BANKS AND BANKING.

SAVINKOV, sä'vyĭn-kôf, **Boris Viktorovich** (pseudonym ROPSHIN), Russian politician: b. Vilna, Lithuania, 1877; d. Moscow, 1925. While a student at St. Petersburg he became a Social Democrat. Arrested, he was deported to Vologda where he met Brechkovska, "grandmother of the Russian Revolution," who converted him to revolutionary socialism. He escaped to Switzerland and, after organizing a series of terrorist assassinations including that of Grand Duke Sergius (1905), was again arrested, and sentenced to death. A second time he escaped to Switzerland (1906). After the revolution of February 1917 he was appointed vice minister of war in Kerensky's second coalition government of August. The Bolsheviks set a price on his head, but he continued to fight them in Poland, where he established the opposition paper *za Svobodu,* and later in Paris. Apprehended by the Ogpu while secretly attempting to re-enter Russia, he was condemned to death with commutation of the penalty to 10 years' imprisonment. He was reported to have committed suicide in prison. Savinkov was the author of the terrorist novels *The Pale Horse* (1909) and *That Which Never Happened* (1913).

SAVIOUR, Order of the. See BRIGITTINES; ORDERS, RELIGIOUS.

SAVOFF, sä'vôf, or **SAVOV, Mikhail,** Bulgarian general and statesman: b. Eastern Rumelia, 1857; d. Vallier-de-Thiey, France, July 22, 1928. Educated at Robert College, Constantinople, the military school at Sofia and the Russian General Staff Academy at St. Petersburg, he won a brilliant reputation in the war with Serbia (1885). Twice minister of war (1891–1897 and 1903–1908) he commanded the army in the First and Second Balkan Wars (1912–1913). He urged the World War I alliance with the Central Powers but was denied a command. After less than a year as Bulgarian minister to France, he retired in 1923.

SAVONA, sä-vō'nä, Italy, in the Province of Genoa on the west coast of the Riviera, 26 miles southwest of Genoa, is one of the most important towns of that region. It is picturesquely situated amid vine-clad hills and orange groves. The Castle of Saint George (1542) is now a military prison; the other buildings deserving notice are a Renaissance cathedral, with the magnificent tomb erected by Sixtus IV to his parents; the Della Rovere Palace, now occupied by municipal officers; other churches, a lyceum, a technical and a commercial institute, other educational institutions, a fine theater, and a large hospital. It is a center of the iron industry, having foundries of all kinds, besides glassworks, potteries, tanneries, brickyards, and sulphur mills. It is an important seaport. Its chief imports are coal, petroleum, iron, cereals, and the exports consist of tomatoes, wood and candied fruits. The harbor, which is good, is defended by a fort. Pop. (1936) 64,199.

SAVONAROLA, Girolamo, jē-rō'lä-mō sä'vō-nä-rō'la, Italian religious reformer: b. Ferrara, Italy, Sept. 21, 1452; d. Florence, May 23, 1498. As a boy he was well acquainted with mediaeval learning and his family intended that he should become a physician, but a disappointment in love turned his thoughts to the church, and in 1475 he left home secretly and joined the Dominican order. After passing a severe novitiate in the monastery at Bologna he was made a teacher there, and in 1482 was sent to Saint Mark's monastery in Florence where he became disgusted at the corruption in church and state, and began to attack the abuses in his sermons. His first success as a preacher was at Brescia in 1484–1485. He fascinated the worldly Italians by his terrible denunciations of vice and wickedness, and returned to Florence with a reputation as a popular preacher. In 1490 he was made *lector* in Saint Mark's, and crowds came to hear him. A year later he was chosen prior of Saint Mark. Though his convent had been favored by Lorenzo de' Medici, Savonarola refused to do homage to him, as was customary. Lorenzo tried in vain to conciliate the friar who continually preached against the abuses in state and church. In 1492, Lorenzo de' Medici, the chief opponent to the work of Savonarola in Florence, died. In the political confusion that followed, and during the invasion of Italy by Charles VIII of France, Savonarola by his public services acquired great influence among the Florentines. He desired a democratic government for Florence, and, when in 1494 the people drove out the Medici, he opposed the schemes of the aristocracy to seize the government, called a mass meeting of the citizens and practically assumed the dictatorship of Florence, superintending the formation of a government in which the people were to fear God and amend their conduct, and prefer public to private interests. A general amnesty was proclaimed, and a council modeled on that of Venice was chosen to administer the government. There was no doge as in Venice, but for three years Savonarola was dictator. His enthusiasm for liberty, his zeal in religion, and his eloquent sermons, caused light-hearted, pleasure-loving Florence to become a city of Puritans. Thomas Aquinas and the Old Testament furnished the spirit of the laws. Though not of the Renaissance and hostile to its spirit, especially to the pagan influence derived from the classics, Savonarola was not an enemy to learning and fine arts, though in 1497 he encouraged committees of children and devotees to search the city for frivolous books, cards, profane songs and music, and works of art of evil tendencies, which were destroyed under the direction of the government. No good books or works of art were destroyed at this time, though the next year many were lost in a second "burning of the vanities." Savonarola aimed at reforming the church in the same caustic way. With his moral reforms he closely knitted political schemes and doctrines, and several times preached vigorously against Pope Alexander VI, who first tried to conciliate him. Savonarola spurned his advances, and in 1496 was ordered to cease preaching, and to undergo a trial for heresy. Silent for a time Savonarola was attacked by the Franciscans and began again to preach. In 1497 he was excommunicated and Florence was threatened with an interdict if she harbored him. For a year he defied excommunication and demanded that a general council be called to depose Pope Alexander. But he had presumed too much upon the support of fickle citizens. Many were weary of

the Puritan rule and longed again for the flesh pots of Egypt; the other cities of Italy were hostile to Florence because of her course during the French invasion and because of her democratic government; there had been famine and pestilence, which Savonarola had been unable to alleviate; some of the followers of the Medici had been executed and thus powerful enemies made; and now Florence was threatened with an interdict. Savonarola had to be guarded by armed followers when he went to preach. In 1498, while still powerful, he in a sermon had called upon Heaven to consume him with fire if he had acted from unchristian motives. A friar of the Franciscan order thereupon offered to pass through the ordeal of fire with Savonalora, who treated the offer with contempt. But the Dominicans volunteered to undergo the ordeal to show their faith in Savonarola, and after hesitation, which his enemies made the most of, Savonarola consented to the judgment by ordeal, believing in Divine intervention in his favor. The fires were made ready and the opposing champions seemed ready to enter the flames, when the Franciscans, who had no intention of carrying out the judgment by ordeal, began to raise disputes to cause delay. They insisted that the Dominicans must not bear the crucifix nor the host through the flames. Savonarola would not agree to give up the latter and the dispute lasted until a rain came and gave the Franciscans an opportunity to slink away. But upon Savonarola was blamed the failure of the ordeal. The populace was infuriated because they had missed the show, and called Savonarola an impostor who was afraid of the ordeal. Florence turned against him; he was arrested, accused of heresy and after six days' torture and a hasty and unfair trial, was condemned to be hanged and then burned. The sentence was carried out with all the refinements of cruelty. Savonarola was a powerful, typical mediævalist, hostile to many of the manifestations of the Renaissance spirit. His talent for political organization was profound, but he was mistaken in thinking the Florentines capable of self-control in politics or of puritanism in religion. The Italian despots understood the people better than Savonarola, and only as a despotic leader was Savonarola himself to any degree successful. His ideals were those of an ascetic, uncompromising, rigid. An eloquent speaker, he, for a time, imposed his ideals upon the Florentines, who when weary of being good, left him to his enemies. Of a mystical turn of mind, he attached great importance to dreams and visions which he related in his sermons. The writings of Savonarola were voluminous, embracing sermons, essays and poems on religious subjects, and a treatise on the government of Florence.

SAVONNERI TAPESTRY. See TAPESTRIES.

SAVOU, sä-voo', **SAVOE,** or **SABOE,** an island of the Asiatic Archipelago in the Indian Ocean, near the islands of Timor and Sandalwood. It covers an area of 237 square miles. The surface is elevated in the centre, sloping seaward. It is well-watered and fertile, yielding millet, corn, beans; tropical products as usual in this latitude, including betel, cinnamon, mangoes, cotton, tobacco, etc. Domestic animals are numerous, besides buffalo, wild boars and deer. Horses and tobacco are the chief exports, sent to Timor. The island consists of five principalities, subject to the Dutch government of Timor. The inhabitants are Malays — a strong race with pagan practices, including dog sacrifices. Pop. 16,000.

SAVOY, House of. The territory of Savoy formed part of ancient Gaul, and from 122 B.C. to 407 A.D. was in possession of the Romans, by whom it was divided into two provinces, the Graian and Pennine Alps. At the latter date it was seized by the Burgundians, but with Burgundy it became subject to the Franks in 534, was included in the Carlovingian empire, and on its dissolution in 887 was granted by the Diet of Tribur to Rudolph, king of Transjurane Burgundy, and with that kingdom was united to Cisjuran Burgundy or Arles. On the accession of the last king of Arles to the imperial throne as Conrad II in 1027, the more powerful nobles of northwestern Italy, such as the Marquis of Susa, the Counts of Maurienne, Turin and Chablais, became vassals direct of the emperor. Umberto Blancamano, Count of Maurienne, was the first of the family who took a prominent place among the princes of northern Italy. His nephew, Amadeus II (1060–80), in right of his mother, Adelaide, heiress to the Marquisate of Susa, added nearly the whole of Piedmont to the original possessions of his house. Humbert II, his son and successor (1080–1103), further increased his dominions by the conquest of Tarantasia. Amadeus III (1103–49) received from the Emperor Henry V the title of Count of Savoy in 1111; and his grandson, Thomas I (1188–1233), who supported Frederick II in his contest with the popes, obtained important accessions in Chambéry, Turin, Vaud and other lordships. Amadeus IV (1233–53), like his father a warm adherent of the emperor, obtained the submission of the city of Turin to his rule, and ceded Piedmont to one of his brothers, Thomas, Count of Maurienne. He was suc-

ceeded by Boniface (1253–63), and Boniface by his uncle, Peter (1263–68), who reconquered Turin, which had rebelled. His nephew, Amadeus V (1285–1323), now mounted the throne; he assisted Philip the Fair in his war against Flanders, and accompanied the Emperor Henry VII to Italy. His grandson Amadeus VI aided the Greek emperor, John Palæologus, against the Turks and the Bulgarians and accompanied the pretender Louis of Anjou, in his expedition to Naples. His son, Amadeus VII (1383–91), forced the Count of Provence to cede to him Nice and Vintimiglia. Amadeus VIII, grandson of the preceding (1391-1451), received the ducal title from the Emperor Sigismund in 1416, acquired the county of Geneva, together with Bugey and Vercelli, and re-annexed Piedmont. Louis, who on the abdication of his father had governed as regent, assumed the title of duke in 1440. The elder male line becoming extinct in 1496, the crown devolved on the nearest collateral heirs, Philibert II (1496–1504), and his brother Charles III (1504–53). The latter aided the Emperor Charles V against Francis I of France, and after losing Valais and Geneva, which joined the Swiss Confederation in 1533, and the canton of Vaud, seized by the Bernese in 1536, he was finally deprived of all his territories by the French king. But his son Philibert Emmanuel, surnamed the Iron Head (1553–80), commander-in-chief of the Spanish army, succeeded in gaining back the greater part of the paternal domains by the treaties of Câteau-Cambrésis (1559) and Lausanne (1564). In 1560 he was induced by the courts of Rome, Spain and France to attempt the conversion of the Waldenses by force, but they offered such vigorous resistance to his troops in several encounters that he granted them, under certain conditions, the free exercise of their religion (5 June 1561). Charles Emmanuel I (1580–1630) was defeated by Henry IV of France, who invaded Savoy and Piedmont. His son Victor Amadeus I speedily regained the possessions his father had lost, and added to them Montferrat, Alba, and some other places, surrendering to France in exchange Pignerol, La Perouse, Angrone and Lucerne. His younger brother Thomas was the founder of the line of Savoy-Carignan. Victor Amadeus II (1675–1730), grandson of the first of that name, at the beginning of the war of the Spanish Succession, sided with France; but bribed by brilliant offers, allied himself to Austria by the Treaty of Turin, 25 Oct. 1703. The victories of the Duke of Vendôme compelled him to retire to Genoa, but the defeat of the French under the walls of Turin by Prince Eugene (7 Sept. 1706) restored his possessions. In 1709 he severed the Austrian alliance, and remained neutral until the end of the war. By the Treaty of Utrecht (1713) he received a part of the duchy of Milan, with the island of Sicily, which conferred upon him the title of king. In 1720 he was compelled to give up Sicily to Austria in exchange for Sardinia, which with Savoy, Piedmont and his other continental dominions, were erected into the kingdom of Sardinia. Consult Wiel, 'The Romance of the House of Savoy' (1901).
